with vitamin C. No chance omission of needed vitamins, carbohydrates or iron can occur Biolae simply and safely affords nutritional elements for optimum health. BORDEN'S PRESCRIPTION PRODUCTS DIVISION

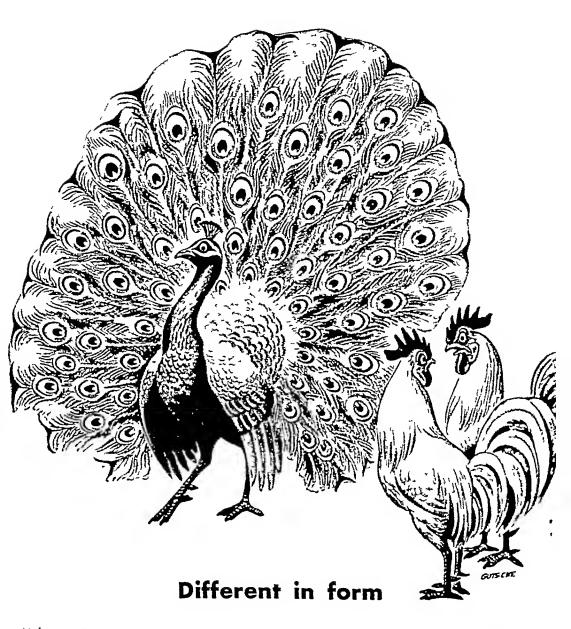

BORDEN'S PRESCRIPTION PRODUCTS DIVISION 350 MADISON AVENUE NEW YORK 17 N Y

### Bíolac

#### "BABY TALK" FOR A GOOD SQUARE MEAL

Biolac is a liquid modified wilk, prepared from whole and skim wilk with added lactore and fertified with viliants B, concentrate of vilantess A and D from cod liver oil, and tron citrate. Evaporated, homegenized, and sterilized. Biolac is available in 13 ft. et. cans et all drug stores.

Maltine with Vitamin Concentrates is appreciated by physicians for the unusual prescription control afforded by its liquid form and its solely professional publicity. Potent, palatable and economical, it finds equally high favor with patients. A balanced multiple vitamin preparation for use as a rational dietary supplement, it is compounded with the precision typical of all Maltine products. Each fluid ounce contains

Vitamin A 10,000 USP Unit Vitamin D 1000 U S.P Unif Vitamin B<sub>1</sub>. 3 Mg Thiamine Hydrochloride Vitamin B<sub>2</sub> 4 Mg Riboflay Nicotinamide 40 Mg Pantothenic Acid 350 Microgram Dicalcium Phosphate 17 grain Maltine q:

Available through prescription pharmacies in battle of 12 fluid ounces The Malline Company, New Yor Established 1875

## Shells of Mercy

et shrapnel, not armor-piercing steel—but sulfas, penicijanalgesics, and surgical supplies ga into these shells mercy Fired to soldiers fighting in isolated pockets, ev help keep open that vital life line of medical aid

Behind this and countless other new developents in the care and treatment of our fighting on is the military medical man. His "war" goes even when the guns are silent. His hours are one His rest periods are few Very often they limited to moments with e cigarette And ore than likely the cigarette is a Camel, for wiels are e service favorite around the world.

### CHRONIC GASTRITIS WITH ACHLORHYDRIA

This condition apparently can exist without marked subjective symptoms. However, in the majority of cases there is complaint of epigastric discomfort.

The general symptoms may be more striking and important than the gastric symptoms

Chronic gastrius with achlorhydria is frequently associated with pernicious anemia which may occasion intense weakness and

fatigue, often unrelated to exertion.

Gastron is of value in the treatment of chronic gastrius with achlorhydria. It may be prescribed with additional HCl if desired Two teaspoonfuls to a tablespoonful diluted with a little cold water is the dose usually prescribed

Gastron

Is an openal extract of the

is an original extract of the organic and inorganic constituents of the entire fresh mucosa of the hog stomach, including the pylorus It is alcohol free The acidified and aromatized extract is incorporated in an aqueous glycerin mensiruum which preserves the enzymatic activity. The preparation is accurately standardized by assay Gastron is more potent in peptic activity than normal gastric juice

HOW SUPPLIED — GASTRON is supplied in 6 ounce and 32 ounce bottles

Originated and made by
FAIRCHILD BROTHERS AND FOSTER
70-76 Leight Street, New York 13, N Y

# for CORRECTIVE TREATMENTS

No animal laboratory tests can supply information as a guide to the proper choice of therapentic footwear. Only the hard-earned experience gained over a generation of fitting shoes to all conditions of feet, and learning from the experience of individuals in all age groups who have not been litted properly before, can provide the essential knowledge adequate for manufacturing and fitting helpful shoes

Add to this the recommendations of specialists in medicine and you have a dependable source for beneficial footwear that supplements your treatments of any member of the (amily

Convenient sources.

### EPINEPHRINE HYDROCHLORIDE 1:1000 N.N.R.

CHEPLIN solution of this powerful vasoconstrictor, hemostatic and circulatory stimulant is adjusted to a definite standard strength and is physiologically assayed by measuring the effect on blood pressure.

EPINEPHRINE HYDROCHLORDE may be administered by hypodermic, inhalation or topical application, affording rapid relief of asthmatio symptoms, urticaria, angioneurotic edema, reactions following injections of biologicals, shock or collapse, and prompt control of certain types of hemorrhage. When used in conjunction with topical, nerve block or infiltration anesthesias, it produces a bloodless operative field and retards absorption of the anesthetic—thus prolonging the period of anesthesias Literature on request

FPINEPHRINE III DROCHLORIDE 1 1000 is packaged in

10 ec. rubber-stoppered vials.

30 cc. rubber-stoppered vials.

30 ec. bottles for topical application.

### ADJUVANT THE TREATMENT OF **BRONCHIAL ASTHMA**

Definite results in recently treated acute bronchial asthma cases, have proven the beneficial properties of ETHER-IN-OIL used in conjunction with other standard medications

Six patients, having had an attack of acute asthma from two to five days, were thus treated (Dr Maietta, N E J Med, Vol 227, p 985). All of them responded fairly well, but not satisfactorily to injections of epinephrine. Four of them received one intramuscular injection of ETHER-IN-OIL, the remaining two received 2 each. Within two hours, the asthmatic symptoms were rapidly controlled. The patients became quieter, were able to breathe more easily and expectorate more freely. Thereafter, the usual palliative medications effectively controlled the symptoms. controlled the symptoms

ETHER-IN-OIL (Brewer) is recommended in addition to (or in conjunction with) Brewer' LUASMIN capsules and enteric-coated tablets—oral medication representing timed therapy in the symptomatic control of Bronchial Asthma

Worcester Massachusetts

The potentiation of the central action of phenobarbital by the belladonna alkaloids (Friedberg, Arch f exp P & P CLX, 276) renders possible attainment of desired effects with relatively small doses, thus avoiding hang over and other unpleasant side-actions. In contrast to galenical preparations of belladonna, such as the tincture, Belbarb has always the same proportion of the alkaloids.

Indications Neuroses, migraine, functional digestive and circulatory disturbances, vomiting of pregnancy, menopausal disturbances, hypertension, etc

Formula: Each tablet contains 1/2 grain phenobarbital and the three chief alkaloids, equivalent approximately to 8 minims of tineture of belladonna

Belbarb No 2 has the same alkaloidal content but 1/2 grain phenobarbital per tablet.

# The Matrix of the Body

Of the amazing array of chemical elements and compounds present in the body, one constituent substance is found in every cell, every tissue, every secretion protein. Though basically similar, it differs in its composition from tissue to tissue, from cell species to species

Subject to the laws of supply and demand, it spends itself in growth, in wear and tear, and in metabolic maintenance. To regenerate itself, it has only one source of the materials needed—the proteins contained in the foods eaten

Among the protein foods of man meat ranks high—not only because of the percentage of protein contained, but principally because the protein of meat is of high biologic quality—able to satisfy every protein need

The Seal of Acceptance denotes that the nutritional statements made in this advertisement are acceptable to the Council on Foods and Nutrition of the American Medical Association

### AMERICAN MEAT INSTITUTE

Vitamin deficiencies create a negative health balance and the physician seeks to overcome this deficit 'Tabloid' Yeast Concentrate, derived from brewers' yeast, supplies the entire natural B complex including the recognized as well as the lesser-known B components, thus settling this nutritional debt

'Tabloid' Yeast Concentrate contains neither active enzymes nor live yeast cells, which are possible sources of intestinal fermentation, gaseous distention, and abdominal discomfort. Indicated both prophylactically and therapeutically for B complex deficiencies, 'Tabloid' Yeast Concentrate provides a dietary adjunct for patients during pregnancy, lactation, convalescence and wasting illnesses, and a supplement for children's diets

### 'TABLOID' YEAST CONCENTRATE

Preparation 'Tabloid' Yeast Concentrate, gr 4 (0.26 gm) Sugar coated. Bottles of 100 and 500 Dosage Depending on the degree of Vitamin B complex deficiency—

THE

The tremendous number of cases of arthritis, published and unpublished, treated with Ertron, testify as to its safety in clinical practice.

Occasionally symptoms of overdosage present themselves, but these are usually of a mild nature and are promptly alleviated on lowering the dosage Usually the dosage may be gradually increased until the optimum level is again being employed

The safety of Ertron is one of the important factors distinguishing it from products containing toxic sterols.

The Whittier Process of electrical activation of vaporized ergosterol, together with careful laboratory control, assures a uniform product of uniform safety and therapeutic efficacy.

Ertron alone—and no other product contains electrically activated vaporized ergosterol (Whittier Process)

#### ERTRONIZE THE ARTHRITIC

Ertronze Means. Employ Ertron in an adequate daily dosage over a sufficiently long period to produce optimal results Gradually increase the dosage to that recommended or to the toleration level. Maintain this dosage until maximum improvement occurs.

Supplied in bottles of 50, 100 and 500 capsules Parenteral for Supplementary Intramuscular Injection

ETHICALLY PROMOTED

### NUTRITION RESEARCH LABORATORIES . CHICAGO

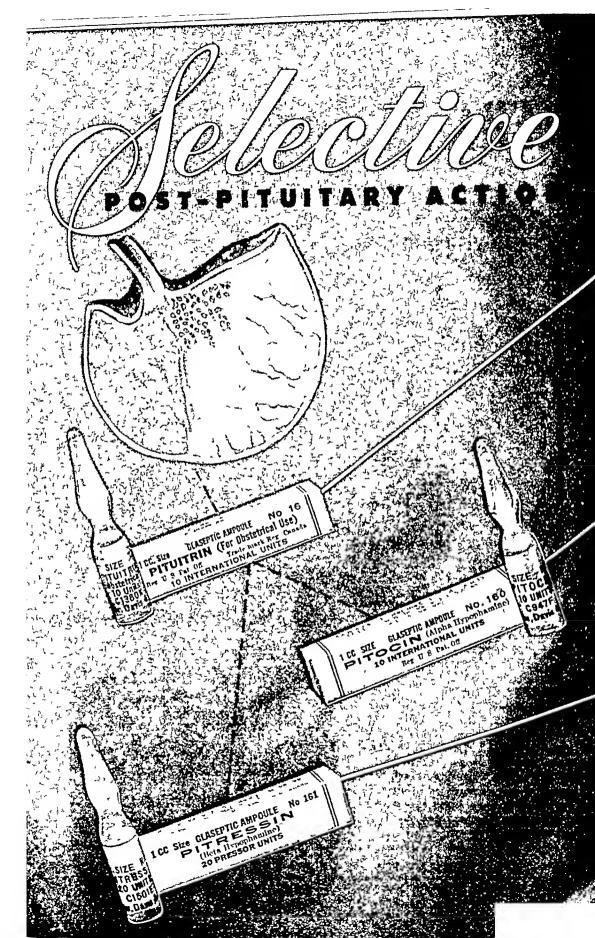

Ertron is the registered trade-mark of Nutrition Research Laboratories.

Views of the left hand of a female, aged 52 years, illustrating an advanced rheumatoid arthritis; duration of disease, 10 years; occupation, typist.

In addition to the marked deformities present, the subnutritional state of the tissues is well shown by the dry, shiny parchment-like skin with almost complete absence of the palmar lines. The terminal phalanges show a reddish discoloration of the ulnar surface.

# of ERTRON in Arthritis

### for pressor and oxylocic effects

### Pholinian

Original aqueous extract of the posterior lobe of the pitilitary gland developed in the Research Laboratories of Parke, Davis & Company, it contains both the pressor and oxytocic factors and is widely used in surgery and obstetrics.

or oxylocic effect.

(alphahypophamine

Aqueous extract of the posterior lobe of the pituitary, gland containing the oxytocic principle, but is relatively free from the pressor and antidiuretic principles. Indicated in cases in which stimulation of the uterine musculature solely is desired.

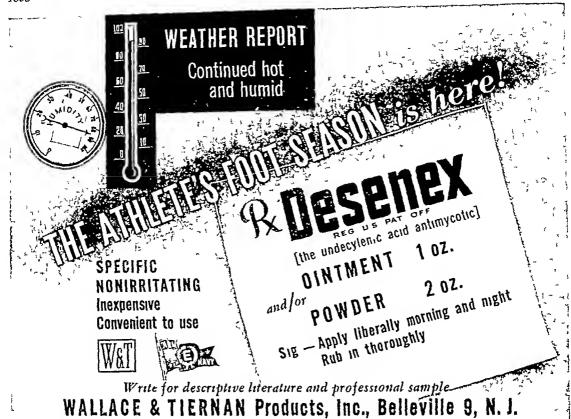

for pressor and antidiuretic effects

### XPITRESSIN .....

Aqueous extract of the posterior lebe of the pituitary gland containing the pressor and antidiuretic principles, of but is substantially free, of the oxylocic principle indicated in the control of diabetes insipadus, increasing the muscular activity of the bladder and intestinal tract, and to raise the blood pressure.

AFFORDS PROLONGED LOCAL ANALGESIA

A vasoconstrictor is added to most local anesthetics, first—to prevent rapid absorption and second  $\rightarrow$  to intensify their action

With Eucupin however, no such supportive adjunct is required, for Eucupin remains fixed for hours and even days at the site of application it combines with the protoplasm of the terminal nerve filaments, breaking down slowly enough to afford the otherwise painful area a prolonged period of intense aneithesia and gratifying analgesia.

Thus when certain procedures and conditions are known to incur long periods of pain, it is obviously funde to attempt to provide enduring control of pain with the common aneithetics. For enduring control, Eucupin is formulated ready for use as follows:

EUCUPIN WITH PROCAINE SOLUTION — for surgical anesthesia by infiltration — 30 cc. vials.

EUCUPIN SOLUTION IN Oil — for proctologic anesthesia by infiltration and conservative treatment of low-back pain — 5 cc, ampules boxes of 6

EUCUPIN OINTMENT—for topical application to the skin and mucocutaneous junctions—1 oz. tubes and 1 lb jars.

EUCUPIN SUPPOSITORIES — for analgesia in anotectal disorders — boxes of 12 (2 x 6)

Local anesthetic-analysis with staying power.

# "Where is the Dust That Has Not Been Alive?"

Tyrothricin, the antibiotic which kills strains of gram-

positive organisms encountered in skin infections and chronic suppurative processes

BACTRATYCIN, antibiotic ointment, stable and nontoxic, presents tyrothricin in true solution—not in suspension—imparting a desirable degree of tissue penetration

BACTRATYCIN is effective in impetigo, pustular dermotitis, infective dermatitis, indolent ulcers, chronic abscesses and related lesions either caused or complicated by strains of streptococci, staphylococci, pneumococci and similar gram-positive organisms

Apply BACTRATYCIN liberally to infected areas in extensive lesions effectiveness is enhanced by placing a water-proof covering (cellophane, waxed paper, etc.) over the ointment before a dressing is applied

BACTRATYCIN is intended for topical use only Do not apply to freely bleeding wounds

Available in jars containing 2 oz.

WINTHROP CHEMICAL COMPANY,

The greatest skill in any field is but outward evidence of the highest measure of control.

It follows naturally, therefore, that the modernly equipped U. D. laboratories should operate under one of the most stringent and efficient systems of quality control employed in the production of fine pharmaceuticals. Based on practical experience, and developed over a long period of years, this system is supervised by the competent Formula Control Committee of doctors, chemists and pharmacists. Notwithstanding all the earlier safety measures applied in the development process, every formula

under the famous U. D. label is finally subjected to the professional scrutiny of this Committee and must meet this group's exacting standards.

Such measures as these account for the confidence accorded U. D. preparations by doctors throughout the country. In your own neighborhood, a convenient Rexall Drug Store provides you and your patients with skilful, economical prescription service . . . using the pharmaceuticals you specify.

# MENSTRUAL ABERRATIONS AND ANEMIA

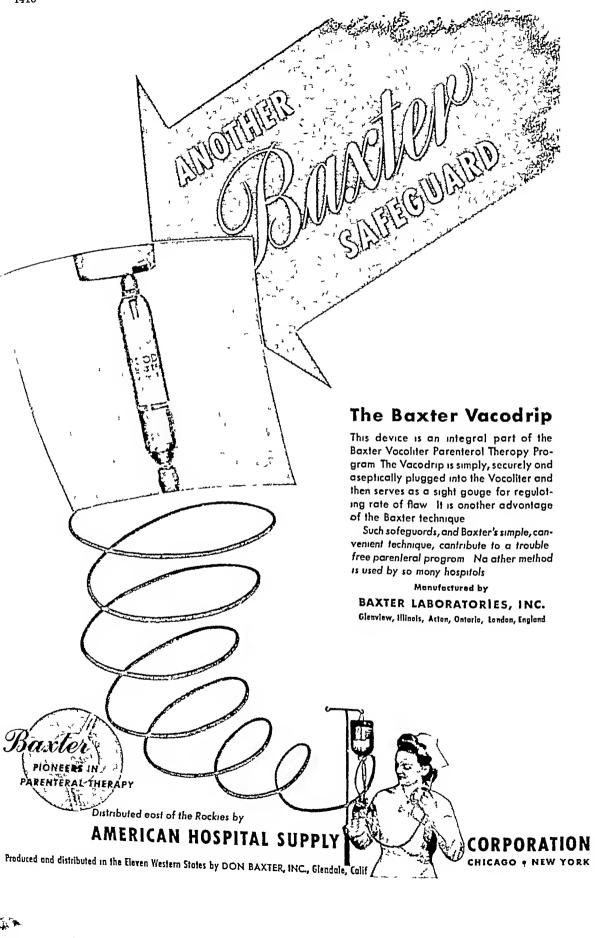

Among the foremost causes of secondary nnemla in women are the frequently occurring menstrual aberrations which increase the volume of uterine bleeding. The result ing depression of the hemogiobia level is usually associated with reduction of gastric acidity, loss of appente, lack of stamina, and of the sense of well being. These coaditions impair the intake, absorption and utilization of the essential blood forming substances at a time when their requirements are in creased. Thus the severity of the

nnemic state is increased by the lack of Iron and the vitamins which aid in its utilization, and in turn theanemin accentuates theanorexia.

Heptuna has proved effective in correcting the entire anemia syadrome because it provides not only an indequate amount of readily utilizable iron, but also the fat soluble vitamins A and D, and the particularly needed B complex vitamins (partly derived from liver extract and yeast)—factors known to be important in the maintenance of normal blood levels and for optimal health.

### Physician Shortage?

Hearings before the Senate Committee on Military Affairs on the Ellender bill to defer medical students have developed into a controversy Dr Victor Johnson, representing the Association of American Medical Colleges, claims that in 1946 there will be a shortage of medical students, and favors the passage of the bill Maj Gen. Lewis B Hershey, of Selective Service, on the other hand, does not favor the bill, the Army and the Navy are against its passage, and at the date of this writing the War Manpower Commission was not heard, although communications from Mr Paul V McNutt were read into the record of the hearings

Apparently the armed services have assured for themselves the requisite number of physicians for their needs for the probable duration of the war. The question which the hearings sought to solve was the continuous flow of premedical and medical students by which the supply of civilian physicians could be maintained.

The Association of American Medical Colleges and the American Medical Association made a joint statement, says the  $JAMA^1$ 

"The mein outlines of this statement were endorsed by every medical school in the country except Columbia, it demonstrated that utterly inadequate numbers of qualified students will be available for admission to 1946 freshmen medical classes.

These must come from the following categories women, men under 18, or those physically disqualified and veterans It will be fortunate if these groups will provide two thousand qualified students, as compared with the normal admission of about six thousand. For example, a recent survey of eight large universities by Harold Dichl revealed that only forty two veterans were enrolled there as premedical students who would become available to medical schools before 1947. Of these about twenty-eight were judged to be good material. Normally, these eight universities provide eight hundred to nine hundred reedical-school freshmen annually."

The Ellender bill seeks to correct the present policies and regulations by providing for the deferment of qualified premedical students and the assignment of acceptable men

in the armed forces to premedical and medical schools

Dr Walter Bloedorn, of the executive council of the Association of American Medical Colleges, and Dr Harvey Stone, of the Council on Medical Education and Hospitals of the AMA, together with Dr Victor Johnson, represented medical education at the hearings

The question is not easy to solve The Army, Navy, and Selective Service claim that deferment of the number of men necessary would hamper the war effort Representatives of medical education, who should be in a position to know, almost unanimously favor the passage of the Ellender bill

No action has been taken by the Senate

Committee on Military Affairs at the date of this writing

It would seem to us that the testimony of the representatives of American medical education should be given very serious consideration. Theirs is, after all, the burden and responsibility of maintaining the continuous flow of premedical and medical students by which alone the quota of civilian physicians can be maintained.

The prospect of material reduction in enrollments of medical school freshmen in 1945 and drastic cuts in 1946, or the admission of inferior applicants by some schools could materially damage the quality of civilian medical care in the future

1 Vol. 128, No 2, p 131

## Westward the Tide

Among many communications received in the office of the New York State Journal of Medicine, none has stimulated us quite so much as the following letter.

"April 4, 1945

Sır

Enclosed you will find Five Dollars (\$5 00), as payment for my subscription to the New York State Journal of Medicine for the year 1945

(beginning January number)

In this connection I would like to state that the amount of my subscription to the above-mentioned Journal for the year 1942 was sent to you in November, 1941, I therefore beg that the corresponding issues be sent to me at your earliest convenience. At the same time, please let me know if you can send to me the issues corresponding to the years 1943 and 1944, and how much I have to forward to you

Please send me a catalog about the latest books and journals you have concerning therapeutics,

internal medicine, and pediatrics

Thanking you in advance,

I remain, (Signature)

MD

Address Tuberias Street, Manila, Philippines'

The payment sent in November, 1941, was never received, for reasons which are understandable. There was a lack of postal system overseas after Pearl Harbor. But Dr.

F H will receive his JOURNAL from now on, including back numbers, with little interference from the setting sun of the Orient, and none at all from the contemptible cutthroats of Central Europe

In connection with the foregoing, it may be of interest to our readers to know that as of March 31, 1945, 3,450 copies of each issue of the Journal go to men in the services out of our 18,511 total distribution Subscribers in the forty-eight states, Panama, Mexico, Puerto Rico, Hawan, and Cuba, total 1,259, of which forty-eight are hospitals in New York State and sixty-six out of the State, forty-two are universities, five are medical societies, eleven are libraries, twenty-four are social-service agencies, sixteen are insurance companies, and so on Nine subscriptions go to South America, and now one to the Philippines

To those who, because of the war, receive their copies of the Journal a little late we can recommend the patience of our subscriber of Tuberias Street, Manila, Philippine Islands, and in the time of waiting until the Journal arrives from the sorely pressed printer, all might profitably consider with the representatives of the United Nations ways and means whereby nobody shall have to wait again for anything because of war Nations are no better than the individuals

who compose them Nobody can delegate his individual responsibility for the maintenance of the national standards, the national ideal, the national resolve to implement in overy way and at whatever cost the mechanisms of liberty and justice to all. No chain is stronger than its weakest link. What do you propose to do about it?

#### Current Editorial Comment

#### Of This and That

"Three quarters of EMIC Activities a million servicemen's wives and infants received care under the emergency maternity and infant-care program in the first two years of its operation," Dr Martha M Eliot, associate chief of the Children's Bureau, United States Department of Labor. reported on March 18 on the second anniversary of passage by Congress of the first specific appropriation for the purpose 1 The "stork bill" now totals close to \$70,000,-000, Dr Eliot said, with "Unclo Sam paying doctor and hospital bills for approximately one baby out of overy six being born these days "

Dr Eliot estimates that under the omergency maternity and infant care program close to half a million bahies have already been born and almost two hundred thousand are on their way, with medical, hospital, and nursing care being provided for their mothers during pregnancy, childhirth, and for six weeks after childbirth. In addition, some seventy-five thousand sick infants have been cared for Infants are cligible for care throughout their first year of life.

All this care has been provided without cost to the serviceman or his family, Dr Eliot pointed out Not infrequently health

officials, doctors, and nurses have gone to great lengths to get care to those in need She paid tribute to the generous cooperation of the physicians who have given unstintedly of their time and strength when they have been hard pressed by wartime practice. Thousands of physicians and hospitals the country over have helped make this program a success, Dr. Eliot asserted.

Emphasizing that the program is a war measure only, Dr Eliot said that novertheless the "very magnitude of the undertaking, providing as it does for these tens of the sands of mothers and babies everywhere the country, under all sorts of circu stances, cannot be without its long-to effects." All who have had a part in getti this care to this large segment of the popution, she said, have learned much about whis involved in making good maternity a infant care available to the whole popution.

With few exceptions the program is no operating smoothly everywhere in the coutry, and the Children's Bureau foresess continued wartime operation until "care he been given the last eligible mother a infant." The program terminates six mont after the end of the war, but care being given the the serviceman's wife or bahy at that till, will be completed

<sup>&</sup>lt;sup>1</sup> O.S. Department of Labor, Children's Bureau News Rolesso, March 18, 1948.

## "Convention in Print"\* UROLOGY

GEORGE E SLOTKIN, M D, Buffalo, New York

NOTWITHSTANDING these arduous times, a voluminous literature in urology has developed in the past year which is significant in the research and advances that this specialty warrants. A review from leading publications has been condensed to cover the more practical phases of this subject.

### Kidney

Renal Anomalies—Hanley¹ reports a case of horseshoe and supernumerary kidney and a case of triple kidney with horseshoe component. This is a rather unusual distinction. Only 43 cases of supernumerary kidney are found in the literature, and in a majority the extra kidney was found below the normal one, usually on the left side, and may be rudimentary. In Hanley's case, the supernumerary kidney was above its fellow, was not rudimentary, and its ureter emptied into the bladder by a separate orifice. This was associated with a horseshoe kidney—a combination previously unrecorded.

Renal Lesions —Deming2 made a study of 330 individuals between the ages of 18 and 38 within the draft age Fifty per cent of the lesions were renal and ureteral calculi Pyogenic renal infection consisted of 38 cases of pyelitis and 5 of pyelonephritis In 11 cases of pyelitis the infecting organism was Staphylococcus aureus, in 22 Bacillus coli, in one B alkaligenes, and in one B mucosus capsulatus Fifteen of the infections were bilateral Most of the cases were treated with sulfonamide compounds There were 5 patients with pyelonephritis Two had bilateral infections with elevated systolic pressure 29 cases, hydronephrosis was noted (88 per Eight patients had bilateral lesions cent) Trauma occurred in 29 patients Twenty-four recovered with expectant treatment quired nephrectomy Tuberculosis was noted in 21 cases, and bilateral disease was present in 5

Hematura of unexplained origin occurred in 12 cases, renal tumor in only 1. Deming's conclusion is that after the fortieth year the individual enjoys his best renal health.

Tumors—Hale and Burkland<sup>3</sup> state that renal tumors may produce symptoms which are not directly referable to the genitourinary tract—Urinary findings may be completely absent—Normal urine does not rule out the presence of tumor, and the classic triad—palpable tumor, hematuria, and pain—is a late manifestation and is of no value in the early diagnosis of these malignant lesions—Distant and multiple metastatic growths are frequent and may give rise to the symptoms before the primary growth—Hematuria is the most important symptom

Cysts—Fister classifies four convenient types of cysts—simple solitary serous, hemorrhagic, small multiple, and multiple, which includes multilocular. The simple cysts are congenital or acquired, may be present at any age, and are more frequent in the male than in the female. They are commonly parenchymal, unilateral, and the lower pole is more frequently involved than the upper. Local symptoms may be absent. Diagnosis is made by x-ray findings, although preoperative diagnosis may be difficult. If there is no associated renal disease and the cyst is not too large, excision is the method of choice. Nephrectomy is only indicated when concomitant renal lesions exist.

Rathbun<sup>5</sup> discusses polycystic disease believes that longevity is better than commonly supposed, that there are two distinct types of the disease, one in the newborn, the other developing in middle or late life. The gross appearance and histologic pictures disclose that they may have different embryologic backgrounds. Of 17 cases, 7 were in infants, the youngest adult was 20, and the remaining were in the third to sixth decades, the average age of the adults being 51 7 Necropsy was performed in 9 cases, and other congenital anomalies were found, such as cystic liver, absence of left kidney, and deformity of the anal ornice Fourteen of the cases were bilateral, one case was of a unilateral kidney Of the 10 adults studied, 4 were hypertensive, 3 intermittently, 1 had normal blood pressure, and 2 were hypotensive

Ruplure—Ferrier and Knigge<sup>6</sup> report 137 cases of ruptured kidney, with 37 deaths, a mor-

<sup>\*</sup> The current issue of the Journal is devoted in part (pages 1418-1439) to a series of articles reviewing activities in various fields of medicine which were prepared for a special pamphlet called "Convention in Print," planned as a substitute for the material to be presented at this year's Annual Meeting of the Medical Society of the State of New York. It was not found practical to publish and circulate this booklet because of wartime restrictions on paper and printing. These articles, however, should be of great practical interest and value to our readers.—Editor

tality of 27 per cent Six were stab or gunshot wounds through the kidney, and the cause of death was peritonitis. The other 31 deaths disclosed associated multiple visceral or ekeletal injuries. Twenty-four cases of moderate trauma were noted. In these, all the patients recovered without surgical intervention. In 69 cases of extensive rupture, many with extravasation, all the patients recovered. Twelve received surgical treatment.

Stone -- Egger' states that it is difficult to influence the chemicophysical factors of the urna, such as colloidal production and surface tension The danger of recurrence is four times greater in operative removal of the atone than in cases which have been eliminated by conservative He believes that the deciding factor of recurrence is in the first few days after opera tion and is due to diminished output of urine from damaged, duminished arterial circulation In 3 cases be performed decapsulation at the time of the removal of the stone, in the belief that the vasoconstrictor factors are climinated with resulting increased arterial flow to the kidnev and an increased production of urine with a low specific gravity

#### Ureter

Intubated Ureterotomy - Davis' discusses a new operative procedure for stricture of the This was inspired by a urethral stricture which had been carefully dissected away, leaving a large hole in the permeum and urethral wall, 32 cm long A catheter was pleced in the urethra and the mucosa spread around the catheter, completely filling this gap He applied the same principle in 5 cases of stricture reported No effort is made to draw the sutures into new form, and no sutures are used, the operation depending upon the physiologic repair processes The splint is a mold on of the tissue Itself which the tissnes, on their own proliferation, reform the ureteral channel, and must be left in place sufficiently long to allow complete prolifera-Davis recommends a splint of sufficient size to fit comfortably without creating ischemia. A minimum of three weeks is allowed for the splint to remain in place, and up to five weeks is preferable.

Transplantation —Reimers' states that the mortality is extremely high in cases of transplantation. In a review of 1,360 cases there were 348 deaths, or 26 per cent. Sixty per cent of the deaths were due to ascending infection of the kidney following operation, and 30 per cent were due to postoperative peritonitis. The peritonitis does not result from imperfection of technic but from biologic process. He advises in some cases nephrostomy or pyelostomy to overcome the

secondary infection and peritonealizing the

#### Bladder

Tumors—Abeshouse<sup>10</sup> collected 20 cases of carcinoma in existrophy with one personal case Adenocarcinoma was present in 21 of the 27 cases

The best results in treatment have come from transplantation of the ureters into the rectum with excision of the bladder. There is much histologic evidence to show that the mucosa of the normally developed and existrophic bladder undergoes metaplastic changes as a result of hronic inflammation, irritation, or obstruction.

Kirwin<sup>11</sup> states that vesical papillomatesis is a term applied to a condition in which multiple papillomas appeared on the mucesa, histologically no different from a solitary growth of the same structure. He believes that it is due to a virus, his work has been supported by other investigators in the etiology of common warts. In support of this conception, Kirwin treated the same by excision with electric loop and sterilization of the mucesa of the bladder by application of 50 per cent phenol in glycerin for three months, followed by 95 per cent alcohol

Jewett<sup>13</sup> emphasizes the importance of rectoabdominal palpation under anesthesia in the selection of cases for cystectomy. In the past two
years be has transplanted bladders in 31 patients,
26 of whom had extensive carcinoma of the bladder. The majority had been under conservative
treatment elsewhere for months, and sometimes
for years. In 15 of the cases palpation of the
bladder from within the peritoneal cavity at laparotomy disclosed a larger tumor than was suspected. In 4 of the 26 cases the bladder was inoperable. Jewett's conclusion, therefore, is that
the usual methods of examination are inadequate
to establish operability. He classifies tumors of
the bladder into three groups.

Group 1—the nonnfiltrating tumors The diagnosis is established cystoscopically. If the mass is extensive so that the possibility of infiltration cannot be excluded, rectoabdominal palpation under anosthesia is advised

Group 2—infiltrating tumors completely confined to the wall of the bladder The appearance of the tumor and the surrounding mucosa suggest some infiltration.

Group 3—infiltrating tumors with perivesical extension, with or without metastasis. In this unfortunate group, total cystectomy in a major ity of cases cannot be performed, this fact is indicated by (a) a large, hard, irregular mass extending beyond the wall of the bladder and palpated through the abdomen, (b) thickening and induration in the inferolateral ligaments of the

## Penicillin in Genitourinary Infections

One thousand, four hundred and fifty-five cases were treated at the National Naval Medical Center 28 There were 711 male patients with gonorrhea The preparation was originally given by the intravenous drip, but this was supplanted by intramuscular injections Twenty thousand units were administered every three hours for five doses, and 98 per cent of the cases resulted in cure In the 2 per cent that were considered failures, cures were obtained by additional administration of 100,000 or 200,000 units, and no cases were found to be resistant to penicillin Studies were made of the urethral and prostatic secretion to determine the response to treatment Hourly smears were made from the urethra and it was noted in many cases that in two hours the gonococci had disappeared, and within six hours no organisms could be found in any case clinical response to penicillin is most spectacular, especially in the cessation of the discharge, but occasionally a mucopurulent drop may exist for several days and then disappear spontaneously

Complications of epididymitis or acute prostatitis were treated similarly with the same spectacular results In each case, only three to four days were required for the prostate or epididymis to assume its normal size Gonorrheal arthritis was treated but no benefit was noted

In 29 female patients success was noted in 23, failure in 2, and indifferent results in 4

In genitourinary tract infections, aside from

gonorrhea, satisfactory response was noted to the preparation, especially in the gram-positive infections

## HEART ATTACKS

Why are there so many heart attacks nowadays? First, there are more people, our population is Many times an incorrect conclusion is made. A man or woman falls down from sheer evhaustion or heat prostration and is registered as "heart attack" Oftentimes a dilated stomach filled with gas and coming under the head of indigestion is called a heart attack, but more frequently a case of true heart attack is termed "indigestion" If you have a pain in your chest or become short of breath see your doctor at once This pain or discomfort is nature's red flag of danger Do not dis-regard it Many a case of pain in the chest proves by careful physical examination and by the electrocardiogram to be a true heart condition I think the early hie of many people is conducive to heart attacks. When I was young, drunkenness was considered a disgrace but now it seems to be an achievement The majority of teen-age boys and girls both drink alcoholic liquor and smoke That this use of alcohol and tobacco in early life is conducive of later conditions of heart trouble to me seems quite reasonable Late hours, irregular meals, excessive sexual habits, worry, family fights, lack of household help—all tend to promote heart attacks

If you make out your income tax wrong you go to

pail—if you make it out right you go to the poor house Do not get "symptom conscious" Do not feel your pulse every once in a while or press your abdomen to see if you have a pain Do not try to count your respiration You cannot do it mins are important, but I disapprove of their commercial use by radio and literature You need vitamins and most of them are contained in sunshine, fresh air, and good substantial foods such as fruit juices, cereals, bread, butter, milk, eggs, meat, fish, and good substantial foods such as fruit juices, cereals, bread, butter, milk, eggs, meat, fish, and good substantial foods such as fruit juices, cereals, bread, butter, milk, eggs, meat, fish, and good substantial foods such as fruit juices, cereals, bread, butter, milk, eggs, meat, fish, and good substantial foods such as fruit and green vegetables Go to your doctor and have a thorough physical checkup once a year even though you feel well Cows, pigs, sheep, and horses get this core why not you. get this care, why not you?

We readily may compare our average lives with the highways of yesteryear and today ago a few horse-drawn vehicles used the road trotting along at a slow and easy pace No one seemed to hurry and life took on an even tone Nowadays our broad concrete highways are crowded with automobiles driving at high speed giving to life the hurry and sourry of near madness

The two great factors in the causation of heart attacks are first, severe emotional strain, second, the difficult times in which we live—T W K, in Nassau M News, Jan, 1945

#### PUBLIC HEALTH, HYGIENE, AND SANITATION

F E COUGHLIN, M D, Albany, New York

A LTHOUGH public-health programs in the year 1944 by the shortage of trained personnel due to the needs of the armed forces, considerable progress was made in several fields and developments are underway which give great premise of accomplishments in the postwar period

Among the highlights in public health, hygiene, and sanitation are those related to acute communicable diseases, tuberculosis, syphilis, the war emergency program for materiaty and miant care,

and labor camp sanitation

#### Acute Communicable Diseases

The incidence of certain acute communicable diseases during 1944 in upstate New York offers a suitable background for considering recent advances in this field that seem to be of particular significance to health in New York State

The disease which dominated the picture in 1944 was poliomyelitis, with 4,192 cases and 234 deaths reported, comprising the largest number of both cases and deaths due to this disease reported for any year since 1916 The major focl were in Eplde-Eric, Chemung, and Steuben counties miologic studies made by the State Department of Health revealed nothing to alter the view that the usual mode of transmission is through person-to-person contact, with the paralytic form of the disease forming only a fraction of the total number of cases About one third of the reported patients suffered no paralysis These findings are in keeping with the reports in the literature which indicate the wide dissemination of policmyelitis virus ın human carriers during epidemic periods A study of the possible therapeutic effectiveness of buman gamma globulin in the proparalytic stage of the disease was conducted in Elmira and Buffalo A preliminary report of the findings indicates that the gamma-globulin solution was of no discernible value under the conditions studied

The epidemic incidence of meningococcal meningitis, which started in 1942, continued during the past year with a total of 790 reported cases as compared to an innual average of 123 reported cases for the five-year period preceding the outbreak. This epidemic wave is a reflection of a country wide increase in inadence which, fortunately, has shown, during the first three months of 1945, a decrease of over 50 per cent compared with the same period in 1944. It is interesting to note that only 17 per cent of the reported patients

are listed as having died from the infection. This compares favorably with the experience in 1918, another war year, when 86 per cent of the reported patients died. No doubt better means of thorapy (sulfa drugs and penicilin) and better case reporting are factors in the relatively low case fatality rate in 1944. Reports? In the prophylactic use of sulfadianne indicate the value of this drug in preventing meningoeoccal infection under the controlled conditions studied.

A fatal case of human rables occurred during the year, the first in an upstate resident since 1930 This can be considered a natural sequel to the continued spread of canine rables in the State Renewed interest is being abown in vaccination of dogs as a means of controlling the dis-Studies by Johnson' clearly show the effectiveness of vaccination of dogs both in the laboratory and, coupled with the climination of stray dogs, in cradicating the disease frem an infeeted focus An amendment to the New York State Public Health Law, effective April 2, 1945. takes cognisance of these facts by making it permissible under certain conditions for does in areas certified for rabies to be allowed at large if vaccinated against rables

The problem of tropical diseases in returning multary personnel is growing and undoubtedly will continue to do so It is the feeling of health officials that there is little reason to believe that any of this group of diseases will offer an important menace to the civilian population of New York State Malaria is probably the only possible exception to this statement However, even though small localized outbreaks do develop. prompt diagnosis, adequate therapy, and mosquito control measures, including the use of a mobile DDT insecticide unit assigned to the affected area by the United States Public Health Service, should be adequate to handle the prob-The major responsibility will probably fall on the practiong physician, who is faced with the problem of properly diagnosing and treating many of these obscure illnesses in returning troops During 1944 240 cases of malaria were reported from upstate New York. Only 4 of these occurred in individuals infected in this State, and in only 2 of these was infection acquired by natural mosquito transmission these two cases the original infection apparently came from imported Mexican laborers rather than from military personnel

It is worth recording a number of all-time low

records established for the upstate area. During the year there were reported 5,413 cases of whooping cough, the lowest number since 1911, and only 29 deaths, the lowest on record. The roles played in this reduction by whooping-cough vaccine in prophylaxis and sulfonamides in treatment of the complicating pneumonias is difficult to assess. In both diphtheria and typhoid fever all-time low records were established for both cases and deaths, with 97 cases and 7 deaths from typhoid and 66 cases with 3 deaths from diphtheria. The 6 deaths attributed to scarlet fever represent the lowest on record

Of considerable importance to those interested in the problem of the spread of air-borne infection are the reports in recent literature concerning practical means of controlling the spread Much of this work has been done under the aegis of the United States Army and Navy The role of sulfadiazine prophylaxis in meningococcal infection has already been noted In addition, extensive studies conducted on a large scale by the United States Navy have shown quite conclusively that such prophylaxis is of value, under the conditions encountered in paval training schools, in preventing most of the common bacterial infections of the respiratory tract The importance of dust in the spread of respiratory infections has been reconfirmed by recent works showing the effectiveness of the oiling of floors and bedelothes in reducing bacterial counts of the air on hospital wards, and in reducing the incidence of cross infections, particularly those caused by beta hemolytic streptococci,

The use of the aerosol vapor, triethylene glycol. has seen fairly extensive practical application in hospital wards and naval barracks A report<sup>7</sup> of the effectiveness of this measure in the wards of a convalescent hospital indicates a 97 per cent reduction in total air-borne bacteria and a remarkable reduction in miscellaneous respiratory infections as compared to control wards Other investigators, have found the combination of triethylene glycol aerosol with oil treatment of bedding and floors far more effective than either measure alone Finally, ultraviolet light has been shown to be of practical value in controlling cross infections in hospital wards, and spread of measles and chickenpot was apparently prevented in schoolrooms 10 A study has been organized by the New York State Department of Health<sup>11</sup> to ascertain the effectiveness of ultraviolet light irradiation in controlling air-borne infection in central rural schools. The ultimate place assumed by each of these various control procedures in the armamentarium of communicable disease prophylaxis cannot be predicted at this time, but it is reasonable to assume that all of them will have some practical application

#### Tuberculosis

Provisional figures for 1944 indicate that the upward trend in tuberculosis deaths among residents of upstate New York which was observed in 1942 and 1943 has been reversed. The number of deaths in 1944 was 2,012 as compared to 2,111 in 1943 and 2,029 in 1942. There was a corresponding decrease in the death rate to 32 6 per 100,000 population in 1944 as compared to 34 4 in 1943 and 33 2 in 1942.

Efforts have been maintained to carry on the fundamental procedures of case finding, segregation and treatment of infectious cases, and follow-up and supervision of diagnosed cases and their contacts

One of the notable recent developments has been the great impetus to tuberculosis case finding provided by the expansion of mass methods of chest x-ray examination. Such x-raying of candidates for the armed forces, of industrial workers, and of other groups of the population has resulted in the discovery of large numbers of previously unknown cases, with a large proportion of them in the early stage of the disease. The tremendous value of this method of case finding has been amply proved and its further extension is therefore indicated

## Syphilis

Despite the loss of men of military age from the population, cases of syphilis in the communicable stages were reported in upstate New York at a level of 30 per cent above that of the prewar years The actual number of cases was 1,347, as compared with an average of 1,037 per year before the war Fifty-five per cent more females in the upstate area were reported in communicable stages in 1944 than in the prewar years Negroes made up 44 per cent of the communicable cases, though this race makes up only 2 to 4 per cent of the upstate population In New York City 54 per cent more cases in the communicable stage were reported, totaling 4,713 in 1944, as compared with 3,079 in the prewar years Here, too, the increase is most marked among women and especially great among Negroes There was a marked increase in both areas in the teen-age group, from 15-20 years of age

In order to check this increased spread of syphilis, facilities for the rapid treatment of cases in the communicable stages were established throughout the state. An entire building at Bellevue Hospital and beds in wards of general hospitals in four upstate cities were devoted to therapy with penicillin and other agents which could be administered in a period of seven and a half to ten days, beginning in the last quarter of the year. Patients were referred to these facilities in numbers increasing each month so that by

the end of 1944, even though this program had only been operating for a fraction of the year. 1,958 patients had been given rapid treatment

#### Sanitation

The effort to maintain the nation's food supply required the importation to New York State during 1944 of an unusual number of migratory farm laborers, creating added problems in camp sanitation in some sections of the state and necessitating revision of the Sanitary Code regulations to adequately meet the altered situation cial emphasis is being given to medical and nursing care, proper housing, and other health problems for these migratory workers

The Mutual Aid program, established as a defense measure, has emphasized the need for the better coordination of sanitary facilities and services in the state A considerable amount of new construction of samtary facilities, such as water purification plants, and sowage-treatment and garbage disposal plants, is being planned as

postwar projects

The developments in the field of small-capacity, low-cost pasteurizers, interrupted by the war, are expected to increase the availability of pasteurized milk to small communities when critical materials are again available

The experience gained during the war, the new construction and developments are expected to result in the more efficient solution of peacetime

problems in the field of sanitation

#### Federal Emergency Maternal and Infant Care Program

One of the major activities of the New York State and New York City Health Departments was the administration under the supervision of the Children's Bureau of the United States Department of Labor, of the Emergency Maternity and Infant Care program

This program, established as a war omergency

measure, provides for maternity care of the wives of men in the fourth, fifth, sixth, and seventh pay grades of the United States Army, Navy, Marine Corps, or Coast Guard and for modical care of their infants (under 1 year of age) The enlisted men clumble for these services constitute 93 per cent of all enlisted men in the armed forces

The program was officially instituted in New York State on July 1, 1943, but was not fully developed in the State until 1944 Up to December 31, 1943, 12,648 applications (exclusive of New York Clty) were received for maternity and infant care During 1944 a total of 52,404 applications (exclusive of New York City) were received for maternity and infant care. This was an average of 4,367 applications per month 1944 the payments made for medical, hospital. and nursing care in upstate New York amounted to \$1,628,637 65 The average monthly number of applications received during the first four months of 1945 was approximately the same as the monthly average during 1944

#### A LAYMAN LOOKS AT DOCTORS

This Journal has had occasion in the past to quote from Winston-Saleun's printer-philosopher Mr John Wesley Clay, whose syndicated column "My Notions" appears in a number of daily papers. His column for January 10 paid a splendid tribute to the medical profession

"Time was when typhoid fever was an annual scourge in these parts. Hardly a family escaped its ravages. The victim would languish for days with a burning fever his strength would ebh away, and after suffering from one to two weeks would either die or recover sometimes remaining a semi invalid for a long time. The disease was no respector of persons.

"It attacked the robust and strong as well as the

physically weak
But thanks to the modern doctor typhoid fover has been put to rout. One of the greatest sources of income to the old-fashioned family physician has been done away with, by the doctors themselves, in the elimination of typhoid fever

That is one of the reasons why we hold the medical profession in such bigh esteem Disease is bruad and butter to the physician, yet he deliberately kills his source of income. They are among God s noblemen. We would hate to see government or politics interfere with this hrilliant and noble class of men."—North Carolina M. J., Feb., 1945

## PHYSICAL MEDICINE

Walter S McClellan, M D , Saratoga Springs, New York

IN DECEMBER, 1943 the Council on Physical Therapy of the American Medical Association recommended that its name be changed to the Council on Physical Medicine In June, 1944 the House of Delegates approved the recommendation 1 Following that action the American Congress of Physical Therapy, which represents the largest body of physicians using physical agents, changed its name to the American Congress of Physical Medicine, and the Society of Physical Therapy Physicians became the Society of Physical Medicine These changes give recognition to the fact that physical agents are used in a wider field than just in treatment Diagnostic procedures, such as the testing of nerve function in nerve injuries, the cold-pressor test for potential hypertension, and studies of surface temperature under conditions of heat and cold in the field of peripheral vascular disease all represent the application of physical agents in the diagnosis of disease The change also emphasizes that physical medicine as a specialty is on a par with other established specialties The Council of our State Society approved the change in the name of our Session to conform with the other organi-

Physical medicine has, during the past year, received very strong support from outside sources. The National Foundation for Infantile Paralysis made a substantial grant of funds to the University of Pennsylvania to establish a center for instruction and research in physical medicine. Dr Piersol, the director of this Center, has described the aims and goals of this center to be

1 The fostering of research designed to evaluate existing technics

2 To develop a broad educational program for physical medicine

3 The improvement of physical medicine in hospitals so that it would be recognized as a useful, necessary adjunct in the practice of medicine and surgery

Also, early in the year, as the result of a careful study by a group of men, the Baruch Committee on Physical Medicine made substantial grants to a number of universities to foster the scientific evaluation and increased clinical application of physical agents. Krusen summarized the preliminary studies of the Committee and reviewed the recommendations which apply to both an immediate and a long-range program for the development of physical medicine. The great problem in the development of both of these proj-

ects is the securing of adequate personnel, both for teaching and for a sufficient number of physicians and technical staff interested in the program. There is no question but that the end of the war will see a real expansion in the work sponsored by these Foundations.

Physical medicine is closely knit with military medicine From the forward lines to the convalescent program of the interior the use of physical agents is employed at practically every step Huddleston and Pruce have shown how this program may be applied at various levels naval medical group, Rudd' has ably described the work of the physical therapy department and Drewyers has described the excellent program developed around the use of the natural waters at Glenwood Springs Drewyer and Hughes' reported that, with the elevation in body temperature which occurred in the natural steam caves of Glenwood Springs, recurrent symptoms of malaria developed in patients whose infection had been quiescent With this activation the application of the usual therapeutic procedures resulted in an apparent arrest of the disease in the greater percentage of patients

No consideration of military medicine can escape the general problem of rehabilitation of the mjured serviceman or -woman Krusen<sup>10</sup> emphasized that rehabilitation must carry the individual from the time of the injury to the time that he is returned to earning capacity and actively employed His nine-step program carries the patient through the medical treatment, the convalescent program, occupational therapy, vocational guidance, training, and evaluation, and the final placement of the individual in some useful occupation It is clear that physical medicine plays an important role, and the coordination of the use of its services with those of the other departments is important in reducing the time of disability as well as in aiding the completeness of recovery

Rehabilitation is not limited to military personnel. The programs developed by Molander, 12 Storms, 12 Coulter, 13 and Zeiter 14 for the care of injured civilian and industrial personnel all employ physical agents to a great extent.

The work of the occupational therapist is closely related to the problem of rehabilitation. The importance of this individual in the program has led to the closer association of the departments of physical therapy and occupational therapy. Many observers feel that these two depart-

ments should be closely integrated and under the direction of one physician. The emphasis in occupational therapy today is the employment of procedures as closely related as possible to the work of the injured individual. In this way it can be determined sooner and with greater accuracy whether or not the individual can take up the work that he was deling before he was mured.

Progress in any field of modicino requires study of the underlying principles related to that field Just as the Internist must have a therough understanding of physiology and hiochemistry or the surgical specialist a careful knowledge of anatomy and body mechanics, so the person who applies physical angents in the treatment of discase must have a careful understanding of theoretic physics, applied physics, and hlophysics to intelligently utilize these agents. Glasser<sup>14</sup> has emphasized this factor, and the Beruch Committee on Physical Medicine<sup>14</sup> has made provision for specific study of physics as related to this field of medicine.

In the specific application of physical agents in various disease conditions many interesting developments have occurred. Space will limit their full development and only n brief mention of

some of these can be made

An epidemic of pollomyclitis hit the country during 1944 end was particularly severe through various parts of our own State. The supporters of the Kenny treatment as well as those who expressed some disagreement with her program have had the opportunity of testing its value, hut sufficient time has not passed to properly evaluate this experience O'Connorty has given us the story of the Kenny method, and a critical review of her work has also been presented Sister Kenny has focused attention on the problem of poliomyelitis and all physicians have resurveyed the information about this disease Watkins and Brazier,19 in the study of muscle strength, electrical excitability, and electromyograms of patients with poliomyelitis, have given us basic tools with which to evaluate this clinical They also applied these tests to poripheral nerve injuries and some other physical cenditions Their findings represent the development of methods by which the extent or progress of recovery can be determined interesting approach in this field is the work described by Miley, to who used the Knott technic of blood irradiation therapy with the Kenny treatment in 58 patients with acute poliomyelitis He reported a more rapid subsidence of the taxo symptoms of those patients who were treated with blood irradiation as compared with those treated by the Kenny method alone This work has not been carried to the point where a final opinion can be expressed on the results

Significant developments in the field of combined fever and chemetherapy have been reported by Kendell and his coworkers, <sup>21</sup> by Licht and Dick, <sup>22</sup> and by Phillips and Mundorff, <sup>23</sup> patients resistant to the sulfa drugs additional progress was made by combining them with fever therapy in the generated infections. The present use of peniculin will, no doubt, modify to some extent the application of the combined fever and drug treatment, but Kondell has continued his studies in this field at the Intensive Treatment Center for syphilis in Chicago

In the treatment of mental discuses the use of electric shock therapy has been widely extended While there is a difference of opinion among various observers in this field, approximately half the patients given electric shock treatment develop satisfactory and prolonged remissions so that they may be returned to normal earning status. The use of curare as described by Kulterti's is a valuable aid in controlling the extent of the convulsion associated with the shock treatment and will be

helpful in extending its opplication

The application of heat in the treatment of pationts with shock from any cause has been care-Colo24 pointed out that fully studied recently heat is detrimental because it increases the metabolle rate, which, because of the increased oxygen requirement, eccentuates the anexemia produces vasodilatation with further decrease in blood pressure and blood flow. There is an increased loss of fluid by perspiration It is, therefere, impossible to place too much emphasis en the proper application of heat in patients with There is no question but that the pilling on of blankets, the use of hot-water bottles, and the application of heat cradies have been detrimental in many patients and may have been n real factor in the fallure of the patient to respond

"Refrigeration anesthesia" has been well described by McElvenny, has Allan, and by Lam. The opplication of cold is based on sound physiologic principles, since it will decrease metabolism and aid in preserving damaged

t1221168

Further description of the treatment with ultraviolet hlood irradiation has been reported by Bradley<sup>28</sup> and Miley <sup>28</sup> They report good results in treating patients with severe infections. With the development of penicillin, many of these patients, of course, are adequately controlled However, further study of the use of hlood irradiation in those patients with infections which do not respond to either penicillin or the sulfadrugs is indicated

A series of articles has recently appeared describing the work which is carried on in the spas where the use of natural agents, particularly

- 13

Arch Phys Therapy 25 82

mineral waters and muds, plays an important part in the spa program 31

The early application of physical medicine in the treatment of fractures has been stressed by Stewart32 and many others Its wide application in the field of arthritis is well recognized

Carter<sup>33</sup> has described the recommendation for wave allocation for the use of diathermy machines which may limit somewhat the use of machines already in operation

Buckelew34 and Regan and Hibben35 stress the necessity for physicians using physical agents to have adequate records, protective devices on their apparatus, and in every way possible guard against the malpractice suit which may be initiated by the patient who is burned or who does not have a satisfactory response to the treatment

Physical medicine is growing and progressing Its application in the treatment of patients is being placed on a firm, sound foundation direction of the program must be in the hands of a trained physician in order to expect satisfactory results from the treatment This physician must be a copartner with the other physicians on the medical staff of any institution in order to have satisfactory and proper cooperation

## "DOCTOR JONES" SAYS-

One of Channing Pollock's stories I read a while ago-it was about some people that bought an old place in the outskirts of a city It was an unattractive neighborhood poor roads, a few run-down houses, a rubbish dump in the offing—that sort of

Well, they began fixing the place up changed the house over so it was artistic, set out trees and shrubbery, laid out a drive-way and all that After a little the idea began to spread The neighbors began fixing up and the city paved the street People began buying lots and building good houses Now it's an extra nice residential section

It all started from those first people fixing up their own place. And, the moral of the story if we want a better world, the most convincing way to go about getting it is to improve conditions where we are

A fellow I heard about a part of his job every day is expounding the virtues of one of these patent remedies for prevention of colds-we'll call it Sniff Snuffer A friend dropped in on him one day and found him dragging around, himself, with a bad cold "Well," he says, "can't be you used Snuffer" He gave him a funny look—"Oh, that

stuff!" he says stuffi" he says Well, anybody't felt that way about it he couldn't be a very convincing salesman If he could demonstrate, from his own experience, that it was as good as he claimed it was, less eloquence might carry more conviction

This same general idea, of course, applies to public health as well as other things I don't see many people but what want to have good health themselves and'll agree that it's essential to their individual success and happiness But what ain't so easy for 'em to see—some of 'em—is that they can't assure their own good health just by looking out for themselves

The best place to be healthy is a healthy community but healthy communities don't just happen. They're made that way by application of measures that're well known and well proven It takes more'n a good health officer to do it He's got to have back of him people that understand what he's trying to do and why and are wholeheartedly for it In s.ort, the best way to start improving conditions is to let our own lights so shine that men can see our good works and see't they are good -Paul B Brooks, M D, in Health News, Feb 19, 1945

#### DERMATOLOGY AND SYPHILOLOGY

#### E WILLIAM ABRAMOWITZ, M D, New York City

A REVIEW of the literature on dermatology and syphilology during the past year elows many reports from the armed forces dealing with sickness of a dermatologic nature. All the common dermatoses are encountered, especially scalles, pediculosis, impetigo, and fuogous infection of the skin. Eczema in the form of contact dermatitis, also intertrigo, prickly heat, furunculosis, and other forms of pyodermas produced mainly by the staphylococcus and streptococcus are common, just as they are in civil practice.

Two agents against pediculosis have attracted attention One is D.D T \* powder, in use at present by the armed forces, for eradication of body lice This preparation is not available for civilian use as yet. It has a lethal effect on lice and nits Its possible usefuiness in other parasitle diseases. such as scables, creeping eruption, and fungous infection is availted with interest The other agent recommended for pediculosis capitis is a lotion containing 40 per cent phenyl cellosolve, 30 per cent ethanol, 5 per cent methyl salloylate, and 25 per cent water This preparation is rapidly effective, easy to apply, economic, and not as clumsy to use as the older methods of treatment.1 Benzyl benzoato is used by some dermatologists for the treatment of scalies It is usually used in a 25 to 50 per cent concentration in an emulsified base It was originally recommended by Kissmeyer' as a more effective and less troublesome method of treatment.

Dermatophytosis is still a therapeutic problem. the evaluation of the therapy of "athlete's foot" is difficult. Infection with the common fungi like trichophyton gypseum, epidermophyton inguinale, etc., will subside with soothing applications in the acute phase, with some mild stimulating agent (resorcin, crude coal tar, etc ) for the subacute stage Trichophyton purpureum infection is, at present, difficult to eradicate, no matter what method of treatment is used Marchionini, Hermann, Peck, Rosenfeld, and recently Keeneys chowed that certain fatty acids, present in sweat, may act as prophylactic and therapeutic agents for various fungous infections of the akin. This has led to the use of sodium proplomate in solution, powder, or outment for athlete's foot, tinea cruris, and otomycosis Other fatty acids are also being advocated

Toxic eruptions known as dermatophytida may appear, especially on the hands, when there

\* Dichlorodinhenvi-triehloroethane.

is an active form of fungus on other parts of the body. They are acute episodes and subside under mild local applications. Chronic exemutous eruptions of the hands are rarely lds and are due either to contact with various agents, bacterids, pustular psoriasis, or some other undetermined cause.

There is an increase in tinea capitis among children in various cities throughout the country \(\lambda\)-ray opilation has been proved to be most effective, for most of the cases are due to Microsporon audouini Various antiseptics in penetrating bases are also being tried. The control of the spread of infection is being belped considerably by the detection of new cases by means of the ultraviolet lamp screened by Wood's filter.

Dermatologists have concerned themselves with a study of cleansing agents and wetting agents that have the ability of increased surface action on the skin. They may be used as vehicles for active drugs that are employed as topical remedles for various skin diseases. These newer vehicles are generally higher fatty alcohols (sodlum lauryl sulfate), sulfonated oils, and purified cholestermized compounds (aquaphors) that make excellent creams and emulsions. They are easily removed by water and are generally nonirritatlng Somo wetting agents possess strong antiseptic action (zephiran, phemeroi) and are believed superior to tincture of lodine, various mercurials, and alcohol ' Zephiran oblorido is a cationio synthetic liquid detergent (high molecular alkyl-dimethyl-benry l-ammonium chloride) whose use causes a rapid degermination of the skin \* Another compound—G11\*—incorporated in soap has been found by Traub and coworkers to maintain a low bacterial count on the skin

Among the antiseptics those of prime importance are the newer antibiotics, like penicillin, tyrothricin, and the sulfonamide drugs. The sulfonamides have a definite place in the treatment of various infections of the skin like erympelas, chancroid, and lympliogranuloma venereum Some success has been noted with sulfapyridine in dermatitis herpetiformis Oral administration is employed The local application of these drugs in localized superficial pyogenic infections, impetigo, folliculitis, etc., is hampered by the frequent development of sensitization if continued over a period of five days or more 7 Penicillin ointment is being tried in impetigo, sycosis vulgaris, and other forms of superficial infections

<sup>\* 2,2&#</sup>x27;-dibydroxy-3,5,6,8 5'6 -hexachloro-diphenyl methane

of the skin due to the staphylococcus, streptococcus, and other gram-positive organisms. These ointments retain their potency for weeks if kept in a refrigerator. They are less sensitizing than the sulfonamides and may become the treatment of choice for the pyodermas.

Tyrothricin is of value as a wet dressing in infections of the skin due to gram-positive organisms, particularly in chronic ulcers of the leg It appears to possess tissue-stimulating properties.

The local treatment of burns is still in a state of flux. Burns of a minor nature will heal under any conventional method. It is important to prevent infection, once it has developed penicillin in preference to the sulfonamides locally may prove to be most beneficial. Tannic acid preparations are no longer recommended.

The treatment of acne vulgaris remains, as in former years, the proper hygiene of the affected areas, including the scalp Elimination of chocolate products in the diet and the avoidance of iodized salt is believed to be beneficial Local cleansing of the affected area with a stimulating. antiseptic, and astringent lotion (lotio alba) is the standard treatment, x-ray therapy is applied in special cases Vaccines, estrogenic substances, and other measures are still sub judice Vitamin A in large doses is being tried, and the results are still being observed. However, care should be used in its use, as it is reported that large doses of vitamin A given over a prolonged period have caused hypoprothrombinemia and other ill effects in rats 10

Urticaria of the chronic recurrent type remains a problem to be solved. Histamine azoprotein<sup>11</sup> has been reported as successful in cases attributed to physical allergy and other allergic states. Urticaria is often of a psychosomatic nature Emotional upsets apparently interfere with proper digestion and the split products may be responsible for the recurrent outbreaks.

Venereal warts have been successfully treated with a 25 per cent suspension of podophyllin in petrolatum <sup>12</sup> Usually one application is necessary Sulzberger and Baer<sup>12</sup> suggest a trial in other types of warts Immunization therapy by means of extracts of warts as suggested by Biberstein<sup>14</sup> may be employed in cases in which recurrences develop

X-ray therapy of various skin diseases has been most helpful in the hands of dermatologists trained in x-ray technic. The treatment of cancer of the skin has been handled by the dermatologist with either x-rays or other physical modalities as indicated. When such treatment is not considered advisable, cases have been referred to the surgeon.

Radiodermatitis is not at present observed

as commonly as in previous years Plastic surgery is usually necessary in such cases, unless the radiation sequelae are of minor nature

The term "eczema" is still retained, although it is considered by many dermatologists to be synonymous with dermatitis When proved to he due to contact with irritants or sensitizing agents, it is generally designated as contact dermatitis or eczema venenata Seborrheic eczema. nummular eczema, infectious eczematoid dermatitis, and dermatitis hemostatica are recognized as separate entities because of causative differences Infantile eczema is called atopic dermatitis because of the accepted belief that such cases are of an allergic character The seborrheic type of eczema (infants, adults) is believed to be parasitic and is treated accordingly ural, papular, and lichemified eruption in adults is called neurodermatitis. It is, in many cases, the continuation of the atopic dermatitis of infancy, and is associated with a family history of allergy or with symptoms of a specific allergic nature Psychosomatic influences have been stressed by other observers, who are inclined to doubt the purely allergic character of generalized neurodermatitis

Occupational derinatitis, especially that occurring in war industries, has received considerable attention in recent years. The list of such contact agents is legion. The investigations by Louis Schwartz and Samuel Peck of the US Public Health Service have been particularly helpful in detection of the responsible agents and in measures for the prevention and treatment of occupational dermatoses.

Poison-ivy dermatitis and dermatitis from allied plants have also come in for their share of investigation. Stevens has recently summarized for the Council on Pharmacy and Chemistry of the American Medical Association our kowledge of this comparatively common skin disease. He concludes that the treatment with poison-ivy extracts in the acute stages of the rash should be discouraged. Immunization may be practiced by the weakest dilution of the ivy extract in consonance with the sensitivity of the patient.

Virus diseases of the skin have been receiving increased attention from dermatologists. Biberstein is employing a stock vaccine prepared rom the vesicles in herpes simplex to prevent recurrences of this troublesome eruption. Anderson has suggested repeated vaccinations (sometimes effective in simple herpes) in erythema multiforme. Eczema vaccinatum and varicelliform dermatitis are considered to be of a virus nature Lymphogranuloma venereum is another virus infection that is being recognized with increasing frequency.

The treatment of the chronic discoid type of

lupus erythematosus and the subscute disseminated type is injections of gold or bismuth Some resistant cases have responded to intravonous therapy with mapharsen. The cause of the disseminated type of lupus crythematosus remains undetermined Treatment at best is only pallia-

Pemphigus has continued to be a puzzling cutaneous disease. Some patients with a benign type apparently recover irrespective of the method of treatment. The more acute and toxic types are usually fatal but occasionally respond to large doses of arrenic, vitamin D (dehydrotach) sterol), or nathuride (germanin) It is not strictly limited to the Jewish people, as some believe

Some new agents have been recommended for Remedies are suggested the cure of psoriasis based on their lipotropic action. A sarsaparilla extract and a soybean lecitlin preparation, together with a fat-poor diet, are being advocated Madden<sup>17</sup> prefers large doves of thiamin Goldfarb" reported cases favorably affected by vitamin P, because it reduces the increased vascular permeability which is behaved to be a factor in this dermatoris The Goeckerman treatment, the use of a coal-tar outment combined with ultraviolet ray radiation, is apparently as effective as any at present

Considerable attention has been pald during the past few years to the recognition of the falsopositive serelogic reaction for syphilis in tho blood and spinal fluid that has been reported from several sources in patients who apparently show no other evidence of syphilis Recent vaccination, malarial infection, typhoid or tetanus immunization, loprosy, or, in fact, any acute febrile disorder, may cause such nonspecific false biologic reactions. They are, however, not of lasting nature and disappear after several They have been more common since the general practice of premarital examinations. Such reports, when falsely interpreted, have led to much distress and serious consequences

The treatment of syphilis since the discovery by Mahoney in 194319 that penicillin is an antispirochetal drug may lead to a revision of present plans of treatment based on the arsenicals and heavy metals. Various organized groups throughout the country are following up cases now running into thousands that they have treated with penfellin in the various stages of the disease Reported results so far are favorable The number of Oxford units of penicillin necessary to achieve ontinum serelogie and clinical results remain as yet purely ompirie. The fear of serious reaction is practically eliminated Long-term observation is required to insure the absence of future relapses, both clinical and serelogic

Many investigations on tropical diseases such as leprosy, oriental sore, filarial infection, and also some of the rare dermatoses, and research of a pharmacologic, physiochemical, and immunobiologic nature concerned with dermatology have been omitted for brevity It is surprising that, in view of the limited facilities at the disposal of dermatologie departments in this country, so many and so varied investigations can take place It is hoped that, in view of the importance and prevalence of various dermatoses, more hospital beds and laboratory space will be allotted to those interested in skin diseases to provide and encourage still more investigative work in this important field

#### MEDICALLY DESCRIBED

A patient who complained of digestive troubles was told by a specialist that he was drinking too

"Well" said the patient, "what am I to tell my wife?" The doctor thought for a few minutes, then said "Tell her you are suffering from syncopation. That will satisfy her "

The patient did as he was told "What is synco-pation!" asked his wife "I don't know," said the hushand, "but that's what he said."

19 Mahoney, J. F., Arnold R. C., and Harris, A. J. Pub. Health 13: 1387 (Dec.) 1943.

When the husband had gone out the wife looked up the word in the dictionary, and found that it meant "Irregular movement from bar to bar"

## **OBSTETRICS**

## CHARLES J. MARSHALL, M D, Binghamton, New York

THE etiology of erythroblastosis fetalis is one of the most confusing subjects to understand. An entirely new conception of a causative agent for a disease must be learned by the physician Also, it is even more difficult to explain such a causative agent to the average patient.

About 85 per cent of the human population have a factor in the blood known as the Rh factor, they are called Rh positive At least six different Rh factors have been discovered If the factor is absent the person is called Rh negative

If an Rh-negative woman conceives a child by an Rh-positive man, the child may be Rh positive by inheritance. The Rh factor of the child causes anti-Rh agglutinins to be formed in the mother's blood, and probably this reaction causes also an outpouring of immature red blood cells into the infant's blood stream. These immature red blood cells are called erythroblasts. Prolonged cyanosis may also cause an outpouring of such erythroblasts, as in micrognathia. Still-birth and premature labor are frequent occurrences.

When the infant is born alive it often has severe jaundice or marked edema, with cyanosis, appearing soon after birth. A severe anemia develops, and the infant often dies. Examination of the blood shows many nucleated red cells. The normal number of erythroblasts in a normal newborn child is probably not over 5 to 10 per cent of the total red cells.

If severe anemia is present the infant should be given a transfusion with Rh-negative red blood cells. If the mother's blood is used, only the washed cells in suspension should be given

The mother of such an infant will occasionally have marked edema without other signs of pre-eclampsia. Excessive postpartum bleeding seems to be more common in such women, also

The antiagglutinins are present after four to five months gestation and several months postpartum as well. These will agglutinate Rhpositive red blood cells. Anuria and death can result from such use of Rh-positive blood.

Only blood plasma should be given until a compatible Rh-negative donor can be found. If Rh serum for testing is not available, the donor's and recipient's blood samples should be incubated for thirty minutes before cross matching, before every transfusion

Rh-positive blood should not be given to an Rh-negative woman, even if she is not pregnant.

No immediate reaction results, but antiagglutinins are then formed in her blood, and her first pregnancy may end in disaster

Often the first child escapes serious erythroblastosis, probably because not a large enough amount of antiagglutinins have been formed Each subsequent pregnancy usually becomes more hazardous for the fetus

The prognosis of future pregnancies can be surmised by testing of the husband's parents If one parent is Rh negative, the couple may have an Rh-negative child which will survive

An Rh-negative woman should only marry an Rh-negative man, unless we can discover some method of "immunizing" the mother during pregnancy

## Demerol Hydrochloride

Demerol hydrochloride is one of the newer drugs used for obstetric analgesia. It belongs to the piperidine group. It causes euphoria, drowsiness, and diminution of pain perception. Scopolamine is given with it to produce amnesia. Usually 100 mg of demerol is given each hour intramuscularly, with 1/100 grain of scopolamine as needed.

Although demerol seems safer than morphine or the barbiturates for the infant, it should be studied further. Demerol is much less depressing to the respiratory center of the mother and infant, but how safe it is we don't yet know. It may be used during premature labor, but not enough premature labors have been studied and reported upon as yet. Some persons have an apparent idiosyncracy to the drug. We have observed transient cyanosis in two mothers.

While the drug does not seem to cause as deep analgesia as the barbiturates, the patient is quieter and easier to manage during labor. It is a valuable addition to our list of analgesies

## Continuous Caudal and Spinal Anesthesia

The controversy about the use and abuse of continuous caudal analgesia still rages. Fortunately, the furor in the press has died down a little, and we now can use it or not, as we wish Several refinements in technic in continuous caudal analgesia have been reported. The new stainless-steel flexible needle has overcome the disadvantage of needle breakage.

Recently Downing et al 1 have described a change in the catheter technic which seems advantageous A 15-gage steel needle is inserted,

with the bevel up, about 5 to 6 cm into the sacral canal. The needle is then rotated so that the hevel is down Through this needle a No 4 nylon ureteral catheter is introduced, with the wire guide inside the catheter Before insertion the wire guide is withdrawn 2 cm, leaving a flexible The steel needle is withdrawn over the cathe-While the wire guide remains in the cathefer tor, the catheter may be moved higher up in the canal \* This apparently obviates the use of a special director, such as Irving2 uses for difficult cases.

Continuous caudal analgesia probably will not be used in a large percentage of cases, until a less toxic drug than those in use non has been discovered

Ullery and Hingson's have used continuous spinal anesthesia, by the Lemmon technic, in over 300 cesarean sections, without a maternal death

Continuous spinal anesthesia requires a small unitial dose of metycaine, usually 15 to 30 mg If the patient's blood pressure falls below 100 mm of mercury some of the drug may be withdrawn It is therefore safer than the "one-shot" epinal anesthesia, especially for cesarean section

Local anesthesia is probably the safest anesthetic for cesarean section. It may occasionally be difficult to use local anesthesis in a patient who has had several laparotomies and has dense abdominal adhesions, and in such a case continuous spinal anesthesia may be the method of choice Less uterine bleeding and less asphyxia of the infant are encountered with local or spinal methods

Above all, the ability of the anesthetist is the most important factor, no matter whether one uses other or any other drug

### Implantation of the Early Ovum

One of the most important contributions to the basic science of embryology and obstetrics has been the study of the development of the early human oyum.

Rock and Hertig' found twelve fertilized ova ranging in age from seven and a half to about fourteen days old Several hitherto obscure details of implantation and growth have been described The ovum apparently obtains nourishment until the twelfth or thirteenth day by actual ingestion of the endometrial stroma, and not from the maternal blood

Profound vascular disturbance takes place also about the twelfth day, and this may cause bleeding, or the "placental sign", or this may occur about twenty-six to twenty-eight days after the last menses

Five abnormal ova were found, all on the antorior wall of the uterus. One had a challow embedment, and the endometrium was of the late secrotory phase

Another abnormal ovum had a deficient trophoblast The placental site showed an excel lent decidual response. This makes one wonder if progesterone could prevent such abortions.

In order to aid the firm implantation of the egg, it is probably necessary to have a normal

supply of glycogen in the endometrium Hughes and Brewer have studied the endometrial curettings of normal women, sterile women, and those who have had several abortions A hydrolytic ensyme is apparently neces-

sary for the metabelism of glycogen

Twenty-seven sterile women showed a lack of glycogen, and treatment with hormones was of no avail Another group of 47 women had an irregular distribution of glycogen in the endomotrium, and enzyme determinations were below Some were benefited by thyroid extreet Sixteen were treated by estrogen therapy, and ten pregnancies resulted, a few were successful after being treated with a gonadotropic hormone

Women who have a lack of endometrial glycogen probably do not ovulate. Women who have some glycogen, but only a small amount of the ensyme, become pregnant occasionally, but they may abort

Hughes advises the use of small doses of estrogen before pregnancy, and estrogen and procesterone early in pregnancy to prevent abortions.

#### THE SEED OF TUBERCULOSIS

Poverty or the fear of poverty, more than any other single factor, changes the tides of battle in favor of the tubercle bacillus in the individual or in the family Poverty engenders crowding, ignorance, nutritional deficiencies, and medical neglect, all of which create a favorable soil for the tubercle bacillus. The result is that benign infections become malignant, closed or sputum-negative cases become open or sputum-positive cases, the spread of germs becomes constant and massive, and cases multiply -Robert E Plunkett M.D., Connecticut State M J. Jan., 1944

## OPHTHALMOLOGY

## HAROLD H JOY, M D, Syracuse, New York

HE most significant feature in the progress L of ophthalmology during the past year has undoubtedly been the development in the experimental and clinical use of penicillin in combatting Owing to its importance this ocular infection review will be mainly confined to a discussion of this subject

#### Penicillin

Experimental —In rabbits parenteral administration of penicillin secures a much lower concentration in the ocular tissues and fluids than does local application 1-2 The simple instillation of drops or ointments containing penicillin does not produce a measurable amount in the aqueous, except in the presence of abrasion or ulcer of the corner 4

However, local application of penicillin in the form of the corneal bath, iontophoresis, the application of saturated cotton packs, or subconjunctival injection secures a high concentration of penicillin in the aqueous and in the anterior intraocular structures In comparing results with these methods von Sallmann' reported that iontophoresis was many times more effective than the corneal bath in increasing the concentration of penicillin in the aqueous humor. The highest concentration was obtained in the aqueous by iontophoresis, and in the cornea and the iris with chary body by the prolonged use of cotton packs, while values were somewhat lower after subconnunctival injection 5

Obviously, the highest concentration of penicillin in the aqueous humor is obtained by direct injection into the anterior chamber cedure causes only a mild transient inflammatory reaction in rabbits6 and is apparently without danger in human eyes 7-9 However, repeated injections may produce irreparable damage 10

In estimating the amount of penicillin in the aqueous humor of human eyes following topical application von Sallmann<sup>5</sup> reported that the values were more erratic than those secured in normal rabbit eyes, the average amount being about one twentieth

Experimentally, the local application of penicillin has proved effective in controlling staphylococcic infections of the cornea in and pneumococcic12 and staphylococcic12 14 infections of the anterior chamber Scobee14 reported that in anterior-chamber infections best results were obtained when local instillations were combined with intravenous administration of penicillin

In his hands injections into the anterior chamber proved disappointing

Sulfadiazine and sulfacetamide do not evert any noticeable antagonistic effect on the bacteriostatic activity of penicillin in vitro 15 Although sulfonamide compounds can be used in combination with penicillin, von Sallmann and DiGrandi16 concluded that in the treatment of staphylococcic endophthalmitis penicilin alone was just as effective

Penetration of penicillin into the rabbit's vitreous humor, and particularly into the lens is inconsiderable following parenteral administration or local application 2 10 16 On the other hand, a single injection of penicillin into the vitreous humor secures a bacteriostatic activity for more than twenty-four hours 17 A single intravitreal injection of 100 Oxford units of commercial penicillin does not cause any noticeable injury to the retina, lens, or optic nerve in rabbits, but repeated injections may produce severe permanent Rycroft<sup>18</sup> injected 1,000 to 5,000 damage 16 17 Oxford units into the vitreous humors of five senously injured human eyes without apparent damage Experimentally, staphylococcic and pneumococcic infections of the vitreous humor have been uniformly checked by a single intravitreal injection of penicillin, 10 18 17 and lenticular staphylococcic infections were arrested by a single intralenticular injection 6

It has been established that local instillations of drops or ointments are effective in external ocular infections produced by penicillin-sensitive The foregoing experimental evidence organisms indicates that anterior intraocular infections are best treated by the use of iontophoresis, cotton packs, subconjunctival injection, the corneal bath, or by direct anterior-chamber injection Such treatment may be supplemented by parenteral administration of penicillin or the sulfon-It would seem that deep intraocular infections are best attacked by a single intravitreal injection of penicillin

Clinical -The clinical application of experimental studies is complicated by many factors and is apt to be disappointing However, pemcilin is proving of such definite clinical value that it is fast becoming the most widely used measure in combatting ocular infection During February, 1944, Wong 19 cited only 4 cases in the literature of ocular disease treated with penicillin the intervening fifteen months about 200 additional cases have been reported These reports indicate

that in infections produced by penicillan-sensithe organisms this chemotherapeutic agent is effective in the treatment of neute and chronic infections of the llds, conjunctiva, cornea, and lacrimal apparatus 7-5,21-27 and that it is a value able prophylactic measure in intraocular surgery and following perforating injuries 23 It has been found effective in the treatment of orbital cellulitis and there are encouraging reports concerning its use in intraocular infections, particularly of an ectogenous origin 5,8 15 29

Heretofore, penicillin has not as a rulo been found effective in the treatment of nonspecific iridocyclitis and chorroretinits 2 6 20 However. Scobee14 has recently reported that, while in no instance was a complete cure effected by penicillin nlone, marked and rapid improvement occurred in 75 per cent of aveits cases and in many cases of characterities

There are many recent developments in ophthalmology which cannot be considered in this review, due to lack of space But there are cortain significant subjects which, to this reviewer, seem of such importance that they domand discussion

#### Ocular Surgery

In the field of surgery the intracapsular extraction of cataract is apparently becoming more routine, the kerntomo section with seissors enlargement has gained in popularity, and the employment of cornecscleral sutures is becoming more universal F A Davis and Wendell Hughes, et al .21 have reported favorably on the use of catgut sutures. In a statistical study on the results of catamet extraction at Wilmer Institute over a period of ninoteen years W F Hnghes. Jr and W C Owens noted a steady improvement in final outcome with the adoption of more modern surgical procedures ployment of cornectcleral sutures reduced the incidence of incomplete wound closure, prolapse of iris, and the amount of astigmatism and hyphemia, while the preservation of the round pupil reduced the likelihood of vitreous loss authors reported that longstanding diabetes predisposed to the development of severe hyphomia. but that evolule and systemic hypertension had no aignificant influence on the occurrence of postoperative complications

#### Sarcoid and Brucellosis

The role of sarcoid and brucellosis in the cause of uvertis has been emphasized by Woods and Guyton 23 In a study of 200 patients with greektis there was definite evidence in 7.5 per cent that sarcoid was the producing cause, and there was presumptive ovidence in 7.5 per cent that bru cellosis was the causative factor

#### Congenitài Cataract

A B Reese<sup>34</sup> has called attention to the occurrence of congenital cataract and other congenital anomalies in children born of a mother who had German measles during the first three months of pregnancy Asido from cathract, the abnormali ties include deaf-mutism, heart defects, microcephaly, and mental retardation. Reese specia lates as to whother the infection in the mother is true German measies and If so, is it an altered type, and has the syndrome existed previously but not been recognized, also, can prophylactic measures be taken to prevent pregnant women from contracting German measles during the first three months of pregnancy, and in case of infection during this period should they have abortion? The syndrome was first reported in Australia in 1042 and apparently is not rare in the United States Its possibility should be consudored in every case of congenital cataract

## HISTORY OF MEDICINE

## T WOOD CLARKE, M D, Utica, New York

ISTORY is the story of the past. To describe "the most significant developments" in the history of medicine "during the past year" one must project one's mind forward a generation or two and look with the eye of retrospection to the years 1944–1945. If our descendants who are historically minded delve into the history of this epoch-making period I believe their first impression will be that they are studying a period of medical chaos. The life of the practicing physician today is completely topsy-turvy

With most of the young practitioners and many of those of middle age removed from the civilian medical body politic and enrolled in the Army or the Navy the heavy burden of practice, the hard grind of routine work, has fallen upon the shoulders of physicians who have been giving serious consideration to the prospect of retirement and a life of ease, and even upon many of those who have already retired and have felt it their duty to return to the hurly-burly of practice. The result is that these older men are doing more than their physical condition justifies, and more and more they are dropping by the wayside with coronary thrombosis or cerebral hemorrhages.

The care of the sick is becoming an ever more difficult problem. With most of the able-bodied women working in munition plants or airplane factories, when a member of a family is taken ill, there is nobody to remain at home to care for him. With thousands of nurses scattered to the four corners of the world tending the armed forces and the government demanding the services of thousands more, a private nurse in a home is usually out of the question. The only solution of the problem is to go to a hospital. This is made more attractive by the tremendous growth in recent years of the various hospitalization plans of insurance societies which have sprung up from one end of the country to the other.

The result of this is that the hospitals are so overcrowded that obtaining a bed is difficult indeed. Single rooms often contain two beds, four-bed wards may have 6 or 7 patients, sun rooms are converted into wards, and often an emergency patient must remain on a stretcher in the hall for hours before a bed can be obtained. Where the government is training recent graduates for Army or Navy service there are interns. In the smaller hospitals interns are lacking, or are replaced by some practicing physician, perhaps physically below medical corps standards.

acting on a part-time basis. Special nurses, too, are difficult to obtain in the hospitals. More and more patients who, under ordinary circumstances, would have two or three special nurses, now have to share one nurse with several patients, or depend on the service of the overworked floor nurses, assisted by the ever willing but only partly trained Red Cross grey ladies or nurses' aids

While this situation puts a tremendous physical strain on the physicians who are left in civilian practice, the cloud which hangs over them has one bright-golden lining Many physicians, during the dark days of the depression, when they were lucky if they received remuneration for 25 per cent of their services, were supporting their families by selling their slowly accumulated securities, borrowing money, or even going on re-Today these men, with their patients earning wages such as they never imagined in their wildest dreams and spending their money freely. are being paid cash on the dot for their increased practice, are paying up the mortgages on their homes, and are salting down war bonds, which will go far to make up for their losses in the hungry 30's

The high wages and the abundant cash in the pockets of the working people have done another thing for the physician They have minimized the danger of State medicine which hung over him like a pall for the past few years people have a good bank balance, giving them confidence that if illness comes upon them they can pay the physician of their choice for his services, the thought of State medicine and regimented medical care becomes less and less attractive The profession is taking advantage of this lull and pushing the private hospitalization plans so that, in event of another depression, the great mass of the people may be insured and will forget their desire for State-controlled insurance

But what of the physicians who have left their practice, their homes, and their families and donned the uniform of Uncle Sam? These first were put through a basic physical training of exercises of a rigorousness for which their previous mode of life had in no way prepared them Some broke down under the strain, were returned to their homes or sent to military hospitals as patients, and face a future handicapped by serious physical disabilities. Those who survived this training were sent to established military general hospitals, or some of the new ones which sprang

up like mushrooms, but looked like schools of Noah's arks, all over the country

For a while many of these physicians in service had little to do and were unhappy over the time they were wasting Others were given work compietely foreign to their special training, as in the case of pediatrists who were placed in administrative positions or opthalmologuets in charge of venereal chaics More recently, however, with our troops scattered over the whole world and the casualties coming back by the thousands, few can complain of not enough to do The members of the Army and Navy medical corps are today doing berole work. In the sweltering cabins of battleships, in the seething jungles of the Pacific Ocean and of Burma, in the rubble beaps of devastated Europe they are working long, exhausting hours over the wounded and the sick. In doing so they are accomplishing results such as have never been dreamed of in previous wars, with equipment such as has never been imagined in all military history One need only compare the superh facilities of our military hospitals of today with those of the Army bospital at Albany in the American Revolution, concerning which Surgeon General John Cochran wrote that its entire supplies consisted of a few galions of vinegar, to appreciate the advances made by military medicine since the birth of our Republic.

The tremendous etrides taken in the care of the wounded on the battlefield, at the advanced stations and hospitals, will probably go down in history as the outstanding achievement of the present war The custom of having each man carry his own first-ald dressings and sulfanilamide to pour into his wounds as soon as received has reduced infection and gangrene to such an extent that these former terrors now can be almost dis-When to this is added the tremendous supplies of penicillin, and of blood plasma which have been sent to our hospitals and advanced stations, the mortality from wounds has fallen off so that today the lives of nearly all men who live iong enough to reach the advanced stations or the hospital ships can be saved

Of equal interest to the historian of the future will be the extraordinary advances which are now being made in the transportation of the wounded Except for the first few miles from the front, the rough solting over bomb-pocked roads in ambulances, which in older days often shook the remaining enack of life out of the injured soldier. are done and with Today, not only do wellequipped hospital trains and ships carry them smoothly to the rear, but the superbiv outfitted transport planes, with attendant physicians and nurses, which them back without a jar or a bump for thousands of miles over land and sea a man wounded on Saipan or Okinawa can be flown to this country and be ensconsed comfortably in his bed in the Rhoads General Hospital. in Utica, five to six days later, the acme of military medical transportation would seem to have

been reached

In the meantime many of the men in service are receiving special training and experience which will enable them, on their return to civil life, to qualify as specialists

Practitioners are becoming expert anesthetists, general aurgeons are having enormous experience in orthopedics, some are attaining special training as neurologic or plastic surgeons, others will return authorities on tropleal diseases, and still others will have attained a wide knowledge of allergy or of the deficiency diseases. The general level of the medical profession along special lines is rapidly being raised. The war, to many, is a splendid source of postgraduate education and practical experience.

Thus to the future medical historian the present era will be looked back upon as that in which miltary medicine has taken the greatest strides of all time, and the care of the wounded its greatest advance since the Battle of Solferino, after which M Henri Dunant founded the International Red Cross

We have learned how to minimize the dangers and borrors of war and devastation. We are glad of what we have learned, but bope never again to have to put our knowledge to practical use

#### THE TEACHING HOSPITAL

Dr Alan Gregg, commenting lately on the demands for further training by returned medleal officers, said "Though there are many civilian hospitals having no interns or residents, the great majority of hospitals provide internships, and often residences as well, but without adequate supervision or guidance. No returning doctor wants the kind of internship that teaches him nothing but what he already knows—that he has lost his full competence in civilian life as a sacrifice to military need. Perhane it is just as well to note that in justice to

its patients no hospital can afford to ignore the need of returning doctors for teaching"

Dr Gregg goes further in his observation and says "An unexpected result of the war may be this that the needs of our returning doctors for further education will startle the American people into realising that the best care is likely to be in the hospital that gives close attention to teaching, and that in self-protection we must help to provide for doctors the opportunity to learn as well as to practice medicine. "Conn. State M J., April, 1945

## RADIOLOGY

## LEE A HADLEY, M D, Syracuse, New York

N MARCH 27, 1945 occurred the centennial of the birth of Wilhelm Konrad Roentgen, who, at the age of 50, discovered a new type of radiation previously unknown to him and which he therefore called the x-ray 1945, then, becomes the occasion of celebrating not only the birth of this able scientist but also the semicentennial of his valuable discovery, a discovery which has already proved of great importance to mankind

The story is familiar how Roentgen, while a professor of physics at Wurzburg in 1895, was engaged in a study of the effects produced by passing electrical currents through a Crookes' vacuum tube. When this was done, he noticed a fluorescence of some barium platinocyanide nearby. This occurred even when the Crookes' tube was covered with black paper. Such a happening might have occurred to any experimenter, but we honor Roentgen because he had the acumen to recognize that a new type of radiation had been produced.

Additional studies revealed the penetrating character of these rays. It was found that they could affect the photographic plate. One of the earliest v-ray negatives showed a key and other metallic objects within a cardboard box which had been placed upon a sensitized plate wrapped in black paper.

Roentgen's discovery was reported to one of the German scientific societies in December, 1895, and early the following year workers in this country were experimenting with these potent radiations

Honors were conferred upon Roentgen, and in 1901 he received the Nobel prize for physics. He died in Munich on February 10, 1923, little realizing the many ways in which his discovery would have already benefited humanity twenty-two years later. There has been a constant advance in the application of v-ray to the diagnosis and treatment of disease.

The use of accessory contrast media has contributed materially to the field of diagnostic radiology. Bismuth and later barium for visualizing the gastrointestinal tract were the earliest examples. Certain organic iodine preparations then appeared for study of the gallbladder, kidneys, and blood vessels, and the use of iodized oil presented a means of visualizing the female reproductive organs, the bronchi, and the spinal canal

In spite of the war, with its resultant curtailing of an overworked x-ray personnel, a gratifying advancement in radiology has continued during the past year. Some research has been done, refinements have been achieved, and worthwhile additions have been contributed to this specialty. An incomplete and hasty survey reveals that New York State has added its share to this advancement.

From the Strong Memorial Hospital, in Rochester, Dr George H Ramsey reports that they are continuing their studies on the use of pantopaque for visualizing the spinal canal. This opaque medium was first reported at our State Meeting last year. It is said to be less viscous than previous media, more easily withdrawn, and absorbable

At the Mount Smai Hospital "the use of angiocardiography has been continued, and publications have been made regarding the use of the method in (1) the analysis of the cardiac configuration in rheumatic mitral disease, (2) atypical coarctation of the aorta with absence of the left radial pulse, (3) nonleutic aortic aneurism, and (4) the value of radiologic examination of the heart" There was also an additional review, "The Roentgen Diagnosis of Lesions of the Pancreas," by Drs Poppel and Marshak of that hospital

Dr Ross Golden, of the Presbyterian Hospital in New York, mentions in a letter the paper describing 100 cases of amebiasis which he and Ducharme presented at the combined meeting of the two x-ray societies in Chicago in 1944 and stated "It served to emphasize the importance of detection of cecal deformities." In this connection, mention should be made of the excellent monograph entitled "Radiologic Examination of the Small Intestine," which appeared from the pen of this author earlier in 1945

I quote further from his letter "I am now making studies of the function of the gastroje-junostomy following partial gastrectomy on the eighth to the fourteenth day after operation. We are finding consistently slow emptying of the stomach pouch. This is due, apparently, to marked hypertonicity of the jejunum associated with slow, sluggish peristaltic movements, and with a slow transit time to the cecum. The reason for this disturbance in the motor function of the intestine is not yet clear.

"We are also making observations on the

position of the fetal head on pelvimetry films taken with the patient erect. With an average normal inlet, the head dlps well down into the pelvis because of the pull of gravity in the erect position. Failure of the head to do this, especially when it is displaced away from the midline, suggests the presence of a mass of some sort in the pelvis. Placenta praevia, fibroids, and dermoid cysts are among the causes.

"Dr Maurice Lenz is treating a series of cases of corneal transplants with small doses of x-ray to prevent vascularization of the grafted corneas This has been mentioned in one article by Dr

Castroviero "

Dr Lois Collins, who discussed the use of priodax before this Society last year, is cooperating

in the survey of the pelvimetry cases

These are some of the activities which are engaging certain members of the section on radi-There are also Items of a legal-economic One of these is a recent letter received interest from our insurance representative. Mr H F Wanyig, in which he states that "the surcharge for x-ray therapy protection under the Group Plan of the Medical Society of the State of New York has finally been eliminated, and that, beginning May 1, 1945, qualified x ray therapists will be able to secure full protection in the Group Plan at the same rates as all other members of the Society" He goes on to review hriefly the history of x-ray therapy Insurance In this state from that time in about 1924 when unfavorable experience indicated a necessary surcharge of 450 per cent for x-ray therapistsi

With a better understanding of radiation therapy and improvements in technic and equipment, the radiologists have effected a stendy reduction of the loss costs and have benefited by a progressive lowering of the insurance surcharge until now

it has been removed altogether

Dr Frederick Elliott was asked to comment upon recent developments of hospital insurance plans as affecting radiologists, and he submitted the following

"The Moreland Commission completed its exposure of the commercial exploitation of this branch of medicine by one corporation and the fee-splitting violation of the Workmen's Compensation Law by this firm and of a small number of physicians who were cooperating with that corporation or competing with it. The head of the corporation defied the subpoens of the Commission and his appeal against sentence for contempt remains "pending in the court." The

conviction of the medical profession in the court of public opinion was immediate, accomplished as it was by news releases of the Commission The chief wrong-doer appears to enjoy immunity through "delayed legal action"

"Representatives of the Hospital Association of New York State, the Medical Society of the State of New York, and of the Joint Council of Pathologists, Radiologists, Anesthesiologists, and Physical Therapy physicians arrived at an agreement upon a more desirable amendment of the laws the next Legislature will be asked to pass the amendments which were agreed upon

"The President of the State Society, Dr Herbert Bauckus, has been uncompromising in his opposition to the inclusion of any form of medical expense coverage in the "Blue Cross" hospital

service contract

"The President of the Hospital Association of New York State, Mr John McCormack, in an editorial comment published in the Hospital Forum for March, has cited the haards which confront both voluntary hospitals and the free enterprise in the practice of medicine, and he calls for unity of action for the welfare of mutual interests. Mr McCormack is Superintendent of the Preshyterian Hospital in New York, and it has been his leadership which gives promise of settlement of what has threatened to become a serious issue between the doctors and their hospitals."

"If, and we must at this time use that word, if, out of this agreement, now and equitable arrangements are made with those physicians whose principal activities must necessarily be intimately related to hospital care, and if physicians in other hranches of medical practice can put aside all opprehension of any design or amhitton on the part of hospital administrators to encroach upon and compete with private medical practice through the agency of employed physicians, then the events of the past twelve months will indeed be far reaching in their consequences

"Complete understanding and harmony between doctors, voluntary hospitals, and the Blue Cross plans is the only sound foundation for continued progress and success of each. All three are dedicated to the public welfare, and the prospect of greater mutual confidence is heartening."

These are some of the developments and events of interest to radiologists which have occurred ie New York State during the past year

> 925 State Tower Building Syracuse, New York

## RESLARCH OPHTHALMOLOGY MEETING CANCELED

The Association for Research in Ophthalmology has canceled its 1945 meeting in cooperation with the war travel and convention program Essayists are requested to reserve their manuscripts for a possible meeting in 1946, in conjunction with the convention of the American Medical Association

## PROGRESS IN THE STUDY OF EXPERIMENTAL ENDOCARDITIS

Ward J Mac Neal, M D , Anne Blevins, R N , Alice E Slavkin, B S , and Helen Scanlon, B S , New York City

(From the Department of Bacteriology, New York Post-Graduate Medical School and Hospital, Columbia University)

A T THE anniversary meeting of the New York Pathological Society in January, 1933, we were pessimistic in regard to our studies<sup>1-3</sup> of endocarditis. Nevertheless, the field was not abandoned and in 1939 we were able to report the transmission of endocarditis to rabbits by intravenous inoculation of pure cultures of streptococci isolated from the circulating blood of patients. Thus there was made available the experimental disease for intimate study of the various stages of endocarditis and for a test object in the study of various programs of therapy.

Some of the results of the later studies have been presented from time to time in scientific exhibits 5-7 and in papers before scientific societies It has been possible to follow the development of the lesions from the initial inoculation through the progressive steps to death of the experimental animal Some of these stages have been The streptococci described and illustrated 8 introduced into the circulating blood are taken up by the endothelial cells of the blood vascular system generally and especially in lungs, liver, spleen, bone marrow, myocardial blood vessels, mural and valvular endocardium, and aortic intima. In most of these situations the phagocytosed bacteria are destroyed without visible trace, but at some places they cause recognizable alterations of tissue structure Such alterations are especially likely to be initiated on the surfaces of the valves which come into contact during closure, namely, the auricular surfaces of the mitral leaflets and the ventricular faces of the aortic cusps, but not to the exclusion of other sites Serious injury of the infected endothelium leads to a deposit of fibrin and platelets and the streptococci grow and extend into the thrombus thus produced and flourish even to and on the surface of the thrombus to be washed off into the blood stream When the host resistance reaches a higher level the superficial fibrin of the vegetation may not permit

invasion of its substance by the bacteria, so that the colonies are found only in the deeper portions

With still more adequate defense this superficial layer of fibrin becomes a favorable scaffold for the entrance of wandering leukocytes and the growth of fibroblasts and of endothelial cells from the adjacent endocardium, so that the vegetation with restrained bacterial colonies in its interior may thus become encapsulated by fibrous and fibroblastic tissue intermingled with wandering leukocytes and covered over by smooth endothelium. This process of local healing is evidently favored by the presence in the blood of agents which restrain the active proliferation of the streptococci The natural agents of this type produced by the host animal may be reinforced by properly selected and properly administered bacteriostatic therapeutic agents, particularly the biologicals-penicillin and bacteriophages, and the chemicals—sulfonamides, arsphenamines, Healing depends, not upon exand bismuth termination of the streptococci by these agents from without, but essentially upon the successful encapsulation and organization of the vegetation by the living cells of the host animal, aided by the bacteriostatic and growth-restraining influence of the therapeutic agents, leading to the secure encapsulation of the bacterial colonies and their eventual extermination by phagocytosis Local healing of the lesions and bacteriolysis and complete arrest of the disease are thus ac complished

One of the fruits of these experimental studies may be recognized in the less pessimistic view now held in regard to prognosis of the human disease, to which happy state of affairs many other elements and many other workers have contributed. In the last two years we have observed the clinical arrest of bacterial endocarditarin a dozen of our patients 10-13

In the course of this work we have come to appreciate more and more the diversity of bacterial types concerned in the causation of bacterial endocarditis and the practical need of bacteriologic study of each individual bacterial strain obtained by culture of the patient's bloom order to devise intelligently a promising their peutic program and to be properly guided in it practical application

<sup>\*</sup> Presented with demonstration of microscopic preparations and of lantern slides before the New York Pathological Society, March 22, 1945

Aided by a research grant of the United Hospital Fund of New York, by Grant No 522 and Grant No 523 of the Committee on Therapeutic Research, Council on Pharmacy and Chemistry, American Medical Association, and by the Virus Research Fund of the Lambert Pharmacal Company

So much for bacterial endocarditis at the moment

The nonbacterial forms of endocarditis have presented somewhat greater obstacles to experimental study Respectful reference should be given to the work of De Vecchi14 and of Andrei and Ravenna<sup>16</sup> and others of the Italian school. who have observed cardiao lesions, especially in the myocardium, in rabbits following Inoculation with material from patients with rhoumatic fever-lesions which they could not with certainty distinguish from those found in naturally diseased rabbits, also to the observation of virus particles In pericardial fluid in rheumatio carditis by Schlesinger and bis associates, and further to the production of experimental pancarditis (without recognized valvular vegetations) as a result of inoculation with Virus III by Pearce "

We have studied the hearts and other organs of uninoculated rabblts which died in the laboratory from various disorders and also the organs of animals inoculated with viruses of influence. vaccinia, and mouse poliomyclitis (Theiler virus), and further, the animals moculated with blood of these primary animals in series. Rabbits have also been injected with whole blood and blood plasma of apparently normal rabbits and of normal human beings and with fluids of normal embryonated eggs. Of chief interest at present are those animals, rabblts, guinea pigs, and mice which were inoculated with material from persons with rheumatio heart disease and fever, including whole blood, blood plasma, and pencardial fluid, filtered and unfiltered. In these there has been observed evidence of a disease characterized by disseminated lesions in the vascular system. affecting especially the endothehum and adjacent connective tissue of the pulmonary arterioles. the mural and valvular endocardium, and the aortic intima. In the endocardium, thickening is produced by edema, extravasation of blood, and hyperplasia, leading to irregular deformities Local verrucous elevations arise by overgrowth of endothelial cells and hy edema of the underlving stroma In comparison with bacterial endocarditis, this disease is relatively benign and the frequent mitoses in endothelium and stroma indicate the tendency to healing and hyperplastic deformation

The agents concerned in causation of these changes have been found in 10 patients and have been transmitted to as many as 15 rabbits in series Of peuchar interest has been the propagation of the agent or agents in embryonated eggs in series and the production of the disease in rabbits by the injection of the allantoic fluid of these

Some of the preparations under the microscopes are tissues of such animals. These studies have been in progress only since 1943 and only a beginning has so far been made. It is perhaps permissible to bope that the observations on experimental nonbacterial endocarditists may be followed by a renewed interest in this field of in vestigation which may ultimately bear fruit in the practical combat against rheumatic fever and rheumatic beart disease, not less significant than the recent progress in the field of bacterial endo carditis

## SOME TOXIC ASPECTS OF DIGITALIS THERAPY

W C HUEPER, M D, New York City

(From the Warner Institute for Therapeutic Research)

IGITALIS preparations of various degrees of purity and of different origin and glycoside content, and digitaloid substances, such as strophanthin, ouabain, scillaren, oleandrin, and adonidin, are extensively used in the treatment of heart diseases and have been recommended for the control of obesity (Bram1), the management of indolent cutaneous ulcers (Baron2), and for protection against the lethal effect of high altitude (Fischer's) The medicinal use of these glycosides has not infrequently led to unintended toxic byeffects, particularly when digitals therapy with high doses is practiced, which was favored by the increased potency of digitalis preparations introduced by the rules of the Pharmacopæia XI in 1936 (Bland and White, Herrmann, Decherd, and McKinley<sup>5</sup>)

However, the correct etiologic interpretation of the functional and anatomic reactions associated with digitalis poisoning is not always an easy matter and is doubtlessly missed in an appreciable number of cases because the symptoms characteristic of digitalis intovication resemble in many respects those produced by cardiovascular diseases for the treatment of which digitalis preparations are employed (Rossier, Dresser, and Simmen; Blumberger and Krüskemper, Büchner, Lendle ) Manifestations of cardiovascular disease and digitalis poisoning may, therefore, be superimposed upon each other and the causative distinction between them may be extremely difficult or even impossible symptomatic similarity is so strong that the toxic action of digitalis glycosides on the cardiac function has been fraudulently and, in a great number of cases, successfully used to cause simulation of heart disease for the collection of disability insurance (Hedley<sup>10</sup>) It is obvious that the diagnostic difficulties confronting the clinician in this respect are accentuated for the pathologist, who often is entirely unaware of any toxic therapeutic aspects of the cases coming to autopsy

It is apparently for these reasons that very little information exists as to the possible role which medicinal digitalis poisoning may play in the development of certain hematic changes and of vascular and visceral lesions observed in patients with chronic cardiovascular diseases who received considerable amounts of digitalis preparations and showed at times toxic symptoms (Petri<sup>11</sup>) Travell, Gold, Modell, and Auerbach<sup>12</sup> were unable to demonstrate in patients of this type any myocardial hemorrhages and cerebral

lesions Halin 13 noted that the actual occurrence of chronic digitalis injuries in man is doubtful The only investigation in which serious consideration was given to such interrelations was reported by Blumberger and Kruskemper studied a 37-year-old man who had made within eight days two attempts at suicide by swallowing a large number of tablets containing digitalis glycosides An electrocardiogram taken twentysix hours after the second attempt showed numerous pathologic features, indicating myocardial On the third day after the poisoning the electrocardiogram exhibited an additional peak between the S and T waves which Kisch related to the presence of a myocardial infarct When the patient died eleven months later there was found at autopsy a large scar in the left ventricular wall The histologic examination revealed the presence of numerous fibrous and hyaline foci in the left ventricular wall and a minor to moderate intimal sclerosis of the coronary arteries Blumberger and Krüskemper concluded from the evidence that the ventricular lesions were the end results of myocardial necroses elicited by the preceding digitalis poisoning

In contrast to these menger observations in man there exists a large amount of reliable experimental data attesting the fact that digitalis poisoning produced either by a single lethal or sublethal dose or by repeated smaller doses, orally or parenterally administered, may elicit in dogs, cats, rabbits, guinea pigs, and frogs distinct degenerative or hemorrhagic lesions of the cardiovascular system Inasmuch as the functional symptomatology observed in the experimental animals resembles closely that seen in man with digitalis poisoning, it appears not unlikely that the anatomic sequelae in man are identical with those found in the animals, giving due consideration to the fact that the various species differ in their sensitivity to digitalis glycosides sensitivity scale the cat takes first place, followed by man, with the dog in third place

The earliest observations on the occurrence of digitalis injury to the cardiovascular system are connected with the attempts at the experimental production of arteriosclerosis. It had been found that the introduction of excessive doses of digitalis resulted in an appreciable increase in blood pressure caused by a centrally induced constriction of the arterioles and was associated with bradycardia, attacks of angina pectoris, temporary blindness, and a hard and wiry pulse (Tainter<sup>14</sup>

Hürthle, 16 Klotz, 16 Saltykow, 17 Otto 18) Blickensdorfer and McGulgan16 reported that digitalis intravenously given may raise the blood pressure 4 Fischer.20 to a level of 300 mm of mercury Orlowsky,21 Klotz, Morelb,22 Kon, and Rühl23 noted that in rabbits repeatedly intravenously injected with digitalis preparations (digitalin, digaten, digitoxin, digitaline nativelle) there were extensive medial hyallne necroses and calcifications in the north sometimes associated with the development of ancurysms. Similar lesions were seen after the intravenous introduction of strophanthin and adonidin into rabbits by Orlowsky, Weselkow 24 and Otto As these aortic reactions are anatomically identical with those observed after the intravenous Injection of epinephnne into rabbits, the conclusion can be drawn that an acute and sovere constrictory vascular ischemia represents the causative mechanism active in the production of the aortic reactions following the intravenous Injection of digitalis glycosides into rabblts

Degenerative or selerotic lesions of the mediumsized and small visceral arteries were not seen after experimental digitalis possoning by most investigators (Dearing, et al 16) Ruhl attempted unsuccessfully to elicit a hypertensive arteriosclerosis in animals by giving daily injections of digalen over prolonged periods (up to 163 injec-Only the renal vessels showed hypertrophic changes without any degenerative reac-Huener and Ichniowski. 26 on the other hand, recorded the presence of edematous swelling and hyaline degeneration of the walls of the renal and coronary arteries of cats following the repeated parenteral introduction of sublethal doses of a digitalis preparation representing the full activity of the leaf It appears to be likely that in the production of the lesions in the myocardial vessels not only a vasotonic ischemia is instrumental, but also a mechanical compression of the vascular wall by the prolonged systolic contractions of the surrounding myocardium, which reduces and temporarily arrests the coronary circulation

These circulatory disturbances in the coronary system causing vascular ischemia and stasis in the myocardium, and especially in its subendo-cardial parts which are supplied by the distal portions of the coronary tree, are evidently responsible for the second type of digitalis injury found by many investigators in the hearts of various species after the single or repeated parenteral as well as oral administration of digitalis proparations in lothal or subletinal does. These lesions consist in the mammalian hearts which have a coronary circulation of myocardial bemorrhages, fragmentations, degenerations, necroses, and calcifications combined with intorstitial edema

and leukocytle infiltrations In the hearts of frogs, in which a coronary system is absent, there appear necrotic contraction rings and, occasionally, larger areas of hyaline necroses These reactions are especially readily and frequently elicited when digitalis is intravenously given However, they have been observed also after the repeated oral introduction of sublethal doses of digitalis The invocardial manifestations make their appearance in general on the third day after the injection of a single dose, but they may be observed as early as thirty-six hours following the ndministration of repeated small toxic doses (Bauer and Reindell<sup>27</sup>) As animals thus treated not infrequently succumb to a delayed death occurring several weeks after the poisoning, the acute reactions in the myocardium have subsided by that time and fibroblastic and hyaline scars take the place of the degenerations and necroses. It may be mentioned in this connection that LaDue" suggested that such fibrous lesions produced in poisoned dogs were not caused by digitalis action but were the result of an avitaminosis Bi (thiamine)-beriberi-ensuing from the defective nutrition of the animals and resulting from frequent vomiting and starvation by loss of appetite This explanation has no ment, as the early stages of myocardial reactions are demonstrable in animals a few days after the poisoning when the transition from the degenerative type into the eightricial type of lesion is clearly apparent and the presence of an avitaminosis is out of the question

The ischemic myocardial lesions were first described by Lewitzky? In 1904 and have been subsequently produced by Büchner, Bauer and Reindell, Hu, Lieu, and Li, Van Dyko,? North and Spang,? Lindner,? Hueper and Ichmovski, Travell, Gold, Modell, and Auerbach, Dearing, Barnes, Kenohan, and Essex,? Dearing, Barnes, and Herrick,? Kroets,\* Weese and Dleckhoff,? Bauer,\* Schulze,? Rosenhlum, Biskind, and Kruger,\*

The vasoconstructory ischemic genesis of these reactions is supported by the observation that the simultaneous administration of tonephin, a posterior pituitary extract, and of thyroid extract hastens and aggravates the development of myocardial necroses in experimental digitalis poisoning (Lendle, Dearing, et al.), that simultaneous excessive physical labor exerts the same effect (Schulze), and that the same type and location of tesion is found in deaths from angina pectoris (Büchner) While tonephin alone does not produce myocardial lesions, prolonged administration of this agent causes vascular sclerosis (Schaumann<sup>4</sup>)

In addition to various digitalis preparations

(digitoxin, digifortis, diginalid, lanatosid C, digitalum verum, tincture of digitalis, digitalis infusion, gitalin), ouabain, strophanthin, and oleandrin, as used by Lendle, Hu, Lieu, and Li, and Lindner, have been successfully used in the production of these myocardial reactions demonstration of the myocardial injuries has given rise to the concept that the functional cardiac reactions connected with excessive cumulation of digitalis are not caused by an excess of active substance, but represent a cumulation of effects, 1e, the superimposition of successive anatomic myocardial lesions produced by the individual doses (Weese) The severity of the myocardial changes found in many of the animals after digitalis poisoning provides a satisfactory basis for the lethal outcome

However, in the histologic analysis of larger series of animals killed by digitalis administration it has been repeatedly observed that some of the animals dying a delayed death do not show any, or only mild, myocardial lesions indicating that the cause of death is not myocardial insufficiency, but must be sought in pathologic changes in some other vitally important organ (Büchner, Hueper and Ichniowski) Hueper and Ichniowski extended, therefore, their histologic studies to all viscera Apart from hyperemia, edema, hemorrhages, and focal necroses in the liver in some of the animals, representing the effects of prolonged circulatory failure, they found in the brain of animals which were more or less free from myocardial abnormalities distinct and often extensive degenerative changes and circulatory reactions The vascular changes consisted of marked capillary engorgement and pericapillary edema The parenchymatous lesions were represented by foci of vacuolated and disintegrating ganglion cells, necroses, and glia cell proliferations

The basal ganghons and the cerebellum were the sites of these manifestations Dearing and his coworkers later confirmed these observations and noted that the lessons were most pronounced in the cortex and were least developed in the spinal cord, but involved also the pons and the Purkinge's cells of the cerebellum They were represented by vacuolization of the pyramidal cells, pyknosis, satellitosis, ghost cells, and cytoplasmic liquefaction of the ganglion cells These investigators stated that these reactions are similar to those elicited by anovia It can be concluded from this evidence that not only the functional disturbances of the central nervous system, such as defective vision, abnormal color sensation, fatigue, headache, epileptiform convulsions, and hallucinations, but also the anatomic cerebral lesions are primarily the result of hypertonic vascular disturbances causing ischemic conditions Extensive anatomic changes of the central nervous system create subsequently an irreversible status of circulatory failure which ultimately and progressively may lead to death without the coaction of myocardial injury

In commenting on the production of myocardial hemorrhages and necroses by excessive doses of digitalis, Kroetz stated that these lesions might favor the development of coronary thromboses because such complications are observed after similar myocardial changes elicited by carbon monovide poisoning The possibility of such interrelations deserves proper consideration in view of the lively interest which has recently been aroused concerning an alleged hematic clotting favoring action by digitalis preparations through alterations brought about in the clotting mechanism of the blood (Gilbert, Trump, and deTakats, Massie, Stillerman, Wright, and Minnich, Macht, and Werch Mecht, Tanaka Tanaka observed in 1928 that the intravenous injection of strophanthin into rabbits caused a distinct decrease in the coagulation time and an increase of the fibringen content of the blood There was no effect by strophanthin on the in vitro clotting of Weger48 reported in 1929 that the intravenous injection of 0 08 mg of strophanthin per Kg of body weight into rabbits elicited on the third day after the injection a rise in the number of thrombocytes up to threefold The peak of this reaction occurred on the fifth day and was followed by a slow return to the original level often reached not before the thirty-first day after the injection It may be mentioned that Billigheimer found the serum calcium level elevated in man after administration of digitalis, and that Choisy™ observed a 50 per cent drop in serum cholesterol several hours after the introduction of saponin-free digitalis preparations also a reduction of the serum cholesterol content in overdigitalized patients

These observations attain increased importance as they connect with the recent claims that digitalis preparations hasten the clotting of blood in vitro, shorten the congulation time in vivo, and favor the development of thrombosis and the occurrence of secondary embolism (Macht, Massie, Stillerman, Wright, and Minnich, Werch, deTakats, Trump, and Gilbert) Werch noted in rabbits which had received intravenous injections of relatively large amounts of digifolin a definite decrease in the congulation time of the Similar findings were reported by Macht when cats were treated with various digitalis preparations (digitalin, digitalein, digitovin, digitonin, digilanid, strophanthin, ouabain, scillaren, and others) The clotting time dropped from eight minutes to one minute and fifteen seconds Macht stated that this thromboplastic action of

digitaloid drugs cannot be ottributed to a hemoivtic action of the glycosides, for only digitalin and digitoxin are hemolyzing saponins Massic, Stillerman, Wright, and Minnich studied 35 patients, age 27 to 78, some suffering from heart disease and ail of them receiving digitalis. They found a significant drop in the clotting time in these patients which gradually disappeared after arrest of digitals treatment There were no changes in the prothroionin time and in the clot retraction time. On the basis of these flodings Massie and coworkers suggested that digitaloid drugs may exert a thromboplastic effect and thus may favor the development of thrombosis even when therapeutic amounts are given observations were reported by deTakats and coworkers when the blood of digitalized dogs was studied with the heparm tolerance test sistance of the blood of such animals to the onticlotting action of hepama was quite pronounced, hut disappeared when the digitalis medication was stopped Inasmuch as thrombotic-embolic phenomena and changes in the clotting mechanism following digitalization seemed to coincide in a number of cases with heart discases, deTakats and coworkers have raised the question whether digitalis plays a causal role in the occurrence of thrombosis in digitalized nationts

The mechanism by which digitalis administration is supposed to accelerate blood congulation has not been elucidated The experiments of Macht indicate that hemolysis by digitalis saponing has no part in this phenomenon observations of Massle and coworkers show that there do not seem to exist any disturbances in the production or action of prothrombin, which may account for the alleged thromboplastic effect of digitalis Consideration must be given to the possibility that increases in thrombocytes. fibringen, and serum calcium may be jovoived in the reported changes of clotting time. No ottention so far has been paid in this connection to the fact that digitalis gly cosides are saponia-like substances possessing surface active properties (Haarmann, Korfmacher, and Leodle, 12 Lendle, 12 von Weissäcker, Straub") which do not manifest themselves to bemolytic action upon ervth rooytes 10 vitro Extracts of digitalis leaves contain, moreover, saponins in varying quantities depending upon their degree of purification The experiments of Koffer and Kaurel and of Frommel<sup>36</sup> have shown that saponing added to digitalis preparations increase not only the resorption of digitalis from the gastrointestinal tract, but also their diffusion through biologic membranes and thus hastoo and intensity the action of the glycosides.

It appears to be possible that the surface active properties of the digitalis glycoaides and their

saponinie contaminants may have some part in modifying the clotting mechanism by acting upon the surfoce of vessels. Investigations of Gratia. Pickering and deSouza, Lozner and Taylor, and Tocanting have shown that the contacting surface exerts a decided influence upon the coagulability of the blood and upon the anticepitalic octivity of normal plasma, causing under proper elrcumstances a hypercoagulability of blood Tocantins stated that adsorbents in contact with plasma decrease its stability and modify the speed of conversion of prothrombin into thrombin The investigations of Lampert and of Hauser, Andreas, and Tucker iodicate that healthy vessels are coated by a layer of low wettability permitting little cootact between the watery elements of the blood and the structures of the vascular walls. If the blood vessels become diseased, wettability increases ond causes a concentration and conglomeration of platelets at the interface, probably by affecting the stability of these elements in the blood.

Recent investigations of Huspers in connection with the problem of atherosclerous have shown that the intravascular introduction of various surface-active agents, such as digitonin, which is the saponin extracted from digitalis seeds, and of various synthetic detergents seems to favor the development of thromboses through their surfaceactive action Changes in the wettability of the vascular wall and possibly also in the colloidal stability of the plasma and of the corpuscular elements suspended in it seem to provide the mechanism active la this respect. This interpretation is further strengthened by the fact that saponins, including digitorin, combloe with free choiesterol la the plasma and in cell membraces and thereby modify the colloidal plasmatic equilibrium and the permeability ond surface activity of biologic and cellular membranes (Schmidt-Thome 1) The actuality of such interrelation in regard to the digitalis problem is suggested by observations of Chouy, who found that rabbits injected over a period of days with solutions of cholesterol in oil develop a certain degree of resistance to digitalia medication

It may oot be amiss to point out in this connection that digitalis does not seem to be the only cardiovascular drug which allegedly exerts a thrombosis-favoring effect, because the investigations of Link and his coworkers<sup>11</sup> suggest that large doses of certain methy lated xanthine derivatives, such as theophyllice, theobromine, and caffelne, clicit in animals, when pareoterally or orally given, a hyperprothrombinemia. The hypercoagulable effect persists from five to seven days in the dog and rahhit and is also demoostrable on whole plasma and whole blood

The evideoce presented in regard to the pro-

duction of untoward vascular, myocardial, and hematic effects by digitalis preparations is mainly of experimental nature and obtained in many instances with doses distinctly above those usually However, the used for therapeutic purposes experimental data are of sufficient importance to attract the serious interest of the clinician and pathologist, for they reveal an aspect of digitalis therapy which is of immediate medical and medicolegal importance and which has not found adequate consideration in the past

symptoms at all A vicious circle is sometimes so produced. This is latent hepatic disease

It is very difficult to establish or even estimate the degree of anatomic restoration or functional recuperation after a single or even after repeated parenchymal injury. And there is some evidence to show that in the present state of our knowledge, one may not lightly escape the thought that perhaps no complete anatomic and functional recovery ever occurs even after a single episode of injury or disease

It is a rare event for the latent changes to be clinically demonstrable. In fully 80 to 90 per cent of the cases, there is no violent upheaval, and the symptoms are so mild in the succession of episodes that unless one is on the lookout, the cases escape notice and their occurrence is not recorded.

Whatever symptoms are present are vague and of a most general nature They include lack of a general feeling of well-being, (2) increased susceptibility to infections of all kinds, both local and general, probably because of lessened antibody formation, or other forms of illness, (3) a slower recovery from such infections than is normal, and (4) lessened resistance to chemical poisons. In industrial workers, there will be noted in addition (5) slower healing of burns and other traumatic wounds, (6) a greater loss of working hours, (7) abnormal fatigue, either more easily produced, or recovered from with more difficulty, or both, and (8) much less power to undergo undue strain of any kind, so that these disabilities become more easily perceptible to the medical officer

In clinical industrial practice an unexpected breakdown necessitating loss of working hours which occurs under the influence of such factors and with such preceding vague symptoms should immediately arouse the thought of an underlying latent hepatic disease and the worker should be thoroughly investigated upon this basis

Corroboration or denial of the assumption of latent hepatic disease can only be obtained in changes of liver function or in the appearance of otherwise unexplainable jaundice. Any degree of jaundice occurring under such conditions is an indication of hepatitis even in the absence of any laboratory data. Observations of the repetitions of these episodes, which, in between, subside again into latency have been clinically observed, and such a cycle has been repeated a number of times. Bloomfield points out the analogy between these long-drawn-out liver cases to the course of glomerular nephritis.

The most important of these vague symptoms is fatigue. This is a rather normal phenomenon for all individuals, but its chief characteristic in health is its short period and its easy and quick

In industrial workers this norrecoverability mal form of fatigue is caused by excessive physical labor, long hours of work, improper working conditions, and various emotional disturbances. In industry fatigue is ıncluding simple boredom a very important factor because it spells decreased or faulty production, either for the individual himself or, because of his deficiencies, for his fellow-workers when engaged in team work tigue is probably the most important form and cause of disability in the industrial worker extraordinary form of fatigue, or its undue prolongation, should immediately arouse suspicion that some underlying disturbance is present

The abnormal basic conditions which exaggerate any form of fatigue in the industrial worker to a state which might be called pathologic include inadequate nutrition and any form of latent disease, especially of the liver of these are mextricably bound together nutrition factor is especially important because of the present tendency, especially in women, to "diet" One should appreciate the fact that this may produce a state of undernutrition, protem deficiency, and hypoproteinemia the symptoms of which, perhaps little understood until now, include (1) loss of weight and strength, (2) loss of stamina or "pep", (3) various degrees of chronic fatigue, and (4) a much lessened resistance to disease At the same time, these manifestations are the earliest and most common manifestations of latent disease of the liver These subjective symptoms are commonly not perceived by the individual lumself cases this latency predisposes to more profound changes, especially in the functions and structure of the liver And the prevalence of such latent conditions is very little understood at its true clinical importance among the profession

The impression is growing that an enriched protein diet is not only advantageous but also very necessary, clinically, both in latent and in recognized liver disease, both as a preventive measure and as an important method of treat-For this purpose the newer knowledge has greatly enlarged the sphere of replacement and enrichment protein therapy as a protective (1) for preventing any impairment of the normal functions of the liver, (2) for preventing the deposition of fat in the liver cell and for a powerful lipotropic activity, (3) for lessening the susceptibility to and increasing the resistance to toxic and chemical external or parenchymatous injuries, to infection, and to other forms of disease, (4) in the facilitation of reparative efforts after chemical or toxic injury of the liver parenchyma, and (5) in enhancing the efficacy of healing in operative and other types of wounds, especially in burns and in other forms of corrosive inury in which there is a sudden and large de-

pletion of proteid

In addition to these effects, there are important general effects, including (6) a sense of well being. (7) increased mental alertness, and (8) increased capacity for work and muscular activity without any undue susceptibility to exceptional states of fatigue. In this regard the previously held clinical regard for a preponderantly or excessively carbohydrate diet for industrial workers has suffered considerably

Summary

Undernutration leads to undue and pathologic forms of fatigue and is frequently associated with unrecognized latent liver disease. In the industrial worker this is an important cause for loss of working hours beyond the average and for decreased or faulty output. In this regard the importance of an enriched protein intake in an otherwise well-balanced and sufficiently abundant diet is stressed as both a proventive and a curative measure

#### FREUD AND HIS WORK

Sigmund Freud may not have been the greatest psychologist of all time but he made what is per

psychologist of an tune nut to be specially bana the greatest contribution to psychology

Freud was born in Moravia, but had byod in Vienna from early childhood, and might have died there if the Nazi invaders had not robbed hun of his worldly goods and insulted him so grossly that further life in that city was impossible. He with his family and several colleagues, took rouge in England, and died in London a few months later

Freud was a Jew and this fact was doubtless a potent cause of Nazi intolerance toward him. It is not unlikely that traits inhorited from his Jewish ancestry were factors in enabling him to achieve tho purpose he had set himself His name will live as the discoverer of the unconscious, or rather ho was tho first to demonstrate the existence of an unconscious or subconscious mind in man, and showed how it might be rendered accessible to useful study and render possible the successful treatment of some meetal conditions. He originated a new branch of science, under the name of psychoanalysis.

His final conclusion, after a thorough exploration and close investigation of the unknown and un charted depths of the unconscious mind, was that the conscious mind is merely a reflection, in some respects distorted, of the inner and hidden persoo ality, that our interests ambitions, aversions, as-pirations and so on the thiogs which make up what we call the real world are only surface emana-tions of this hidden personality. This unconscious mind has an inadequate relationship to the world of reality While in close association with the fundamentals of life, the expressed thoughts of the un conscious, when inhibitions are released, are as weird and fantastic as the delusions of the manne There seems to be no reason in the wanderings of the unconscious mind It is a place of conflicts, con-fused clashings, and strivings between the incheate wishes of one mind and the elements of the other mind, fear being the predominating feature. A cloak of reality may partially cover the conscious expressions of the impulses of the unconscious mind, but they have only a mask of apparent rationality and in a way, are symbols of our upsidedown world

Freud procented the human animal as rent asunder or deeply divided by inner conflicts which sometimes became transformed into outer conflicts of which both sides are usually unconscious, the ovidonces being indirect disturbances of emotion and judgment. Froud gave the name of represent to a strong barner which exerts an extremely powerful, almost impassable resistance to recognition of what is passing in the uncenscious mind

Freud gained much of his clinical experience from the symptoms and dreamlike fantasy life under narcotics and drew the conclusion that the unconscious mind as the primitive mind of the child, is at one and the same time savage and "animal" and possesses stronger moral deterrent tendencies by far than man is aware of "Man is both more moral and more immoral than he knows."

What has made Freud's name known far end wide is his study and the deductions therefrom, of the sexual life beginning with that of the child Freud was the founder of the Psychoanalysis School in Vienna, of which Alfred Adler was a member They parted company when Freud demanded that his associates accept without question his sexual theory

Seven others left Freud's circle and with Adler founded the Society for Free Psychoanalysis, afterwards named Society for Individual Psychology Jung the Swass psychologist, also withdraw from Freud's circle and founded a new school. Charcot, of whom Froud was a pupil, threw the soxual theory of hystoria into disrepute Janet emphasized its emotional causation, while Freud interpresent the mechanism of hysteria as the resultant of a psychic traumatism or nervous shock, of a sexual nature in the first instance, leading to morbid hrooding and a kind of mental involution. As Garrison says in his 'History of Medicine' the interest of Froud was his profound insight into primi tive mentality, or what Jelliffe calls "paleopsy-chology" the historic past of the individual psyche. He has given neurologists a new instrument for exploring unconscious states which, in competent and temperate hands, may be effective.

Frend will deservedly go down to posterity as a great and original man of science. For many years he had suffered from a painful disease which he bore with stole fortitude. Both the great Vienna psychologists, Freud and Adler died in Britain.—If

# THE ROLE OF PYRUVIC ACID IN FATIGUE

NATHANIEL MEYER, M D, New York City

PATIGUE among large groups of employees in industrial plants presents a major health It takes a great toll in illness and disability and contributes to accidents and inefficiency

This report deals with the type of fatigue which is caused by faulty carbohydrate metabolism, especially the inability of the system to fully convert the potential energy contained in carbohydrates into the final oxidative state

Recent literature establishes the value of the vitamins of the B group in carbohydrate metabo-Thiamine, riboflavin, and macin combined with divalent minerals and proteins form coenzyme groups which play an important role in the metabolism of energy foods 1-10 Thia-

mine, for instance in the form of cocarboxylase, is essential to the carboxylation of pyruvic acid into the final ordative products, which only then makes food energy available for the body's

use 11-14

Riboflavin and niacinamide also play an important part in food metabolism These vitamins also form coenzyme systems, such as cozymase, coenzyme 1, and coenzyme 2 that is how their physiologic action is defined 1 4

When the system lacks a sufficient amount of thiamine to complete the metabolism of energy foods, very often pyruvic acid is accumulated in the blood, therefore, when the physician finds an abnormally elevated pyruvic-acid content, he can supplement the diet with concentrated nutritional factors (vitamins of the B complex, certain minerals, and proteins) necessary to reduce blood pyruvic acid to normal and thus aid in eliminating fatigue 13-15

In view of the above, I have organized in our plant a fatigue clinic with the following objectives

To determine the most effective therapy in the type of fatigue which is associated with an elevated blood pyruvic acid (fatigue due to faulty food metabolism)

To determine how prevalent this type of fatigue is among industrial workers

For this purpose I selected a group of 38 employees at Rogers Diesel and Aircraft Corporation, the Bronx, who complained of fatigue, who were not taking vitamins, and whose diet contained a high percentage of carbohydrates group comprised men and women complaining of undue fatigue in the absence of any specific ailment to cause it, and fulfilling the above-mentioned criteria That this type of fatigue is prevalent may be seen from the fact that 31 out of 38 subjects had an abnormally elevated blood pyruvic-acid content

Thirty-one fatigued subjects, each having an elevated blood pyruvic-acid reading, were then divided into four groups, three groups received different types of yeast and yeast extracts and the fourth group, acting as controls, received a At intervals of three weeks blood pyruvic-acid determinations were made. The details of this clinical study may be described as follows

In each case we first determined

(a) a history of fatigue

(b) a history of carbohydrate diet

(c) and the fact that the subjects did not take supplemental vitamins

The subjects reported to the Medical Department without breakfast. After a period of at least thirty minutes of chair rest, venous blood was obtained and its pyruvic acid content was determined by the method of Bueding 15 A nutritional concentrate was assigned to each The formula of each was as follows

Group 1 received a nutritional concentrate comprised of a combination of several types of brewer's yeast and yeast extract A daily dose of three tablets contained the following vitamins 1 mg (333 I U) of thiamine (of which 50 per cent is in the form of cocarbovylase), 300 µg of riboflavin, 2,100  $\mu g$  of macin, 525  $\mu g$  of pantotheme acid, 90 µg of pyridonine, 36 J-I umts of filtrate factor together with other members of the B complex, proteins, and trace minerals, all derived from natural sources and combined with natural amino acids \*

Group 2 received the same product, but instead of the daily dose of three tablets six tablets daily were fed to each of the subjects in this group

Group 3 received a brewer's yeast extract of three tablets daily, containing the following vita-1 mg of B<sub>1</sub> (thiamine), 0210 mg of nboflavin, 02 mg of macin, 01-02 mg of pyrido ane, 035-055 mg of pantothenic acid

Group 4 received a placebo comprised of three tablets which contained only mert materials

Two nurses, under my supervision, distributed daily to each of the subjects the nutritional concentrates in the form of tablets To avoid mistakes the daily dosage of each concentrate was \* This concentrate was supplied by the Nutrex Company,

Inc

put into envelopes and on each was marked Group 1, Group 2, Group 3, and Group 4 Each subject took the concentrate in the presence of the nurses The following results were obtained abnormal values for pyruvic acid were obtained on the first test in 31 of the 38 subjects. The distribution of normal pyruvic neid on the first determination is as follows Group 1-2 of 9 subjects, Group 2-1 of 9 subjects, Group 3 -3 of 11 subjects. Group 4-1 of 9 subjects

This shows a good sampling The distribution of abnormal pyruvic-acid values on the first determination are as follows Group 1-7 of 9 subjects, Group 2-8 of 9 subjects, Group 3-8 of 11 subjects Group 4-8 of 9 subjects shows good sampling. The average in mg per cent of the first pyruvic-acid determinations in the abnormal subjects are as follows Group 1-1.56. Group 2-1 57. Group 3-1 65. Group 4 -1.63

The subjects were then placed on the test substance and pyruvic-acul determinations were performed at intervals through August 14 The averages of the last test in the four groups of abnormal subjects are as follows Group 1-1 11, Group 2-1 39, Group 3-1 40, Group 4-1 47 These figures indicate a definite unmistakable lowering of the pyruvic acid to a normal level in Group 1 Group 2 showed a lowering of the pyruvic acid but not to normal levels group there was only one abnormal subject in whom we obtained a pyruvic-acid determination after June 26, 1944 It is likely that, if more determinations had been made after that date, Group 1 and Group 2 results would not be dissimilar Group 3 showed a moderate lowering in the last test over the first test but not to normal levels. The pyruvic acid in this group was not as effectively lowered as in Group 1 showed a slight lowering of 1 63 to 1 47, but lt was still well above the upper limits of normal This group shows very little, If any, significant lowering of pyruvic acid

In summary, one may conclude that in Group I there was a definite and significant lowering of the blood pyruvic acid to normal levels and Group 4 showed no or little significant lowering of the blood pyruvie acld In Group 2. because of a chance distribution in obtaining samples, we are unable to make nny definite statement other than the above.

During this clinical study a printed questionnaire was filled out by each subject in the Fatigue Clinic which covered the progress of therapy in connection with sleep, appetite, ability to work. and improvement of fatigue.

It is notoworthy that the progress of intigue climination was parallel to the reduction of the blood pyruvic-acid content to normal

It is obvious that fatigue in industry should be investigated and, if it is due to faulty food metabolism, a proper nutritional supplement to reduce the pyruvic-acid content to normal will do much to alloyante fatigue

I wish to express my appreciation to Dr. Norman Jolliffe, in whose laboratory the pyruvio ncid determinations were made

#### ENRICHMENT OF BREAD AFTER THE WAR

Pointing out that both federal and state action will be required to saure continuation of the benefits of enriched broad, now compulsors under wartime regulations, the Journal of the American Medical Association for January 20 declares such a program should have the active support of all informed persons

The Journal explains that "among the important applications of the numerous advances in nutrition is the development of the program for en richment of food By order of the War Food Administration all bakers white hread, white rolls, and sweet rolls must be enriched with vitamins of the B complex and iron to stated levels. The con

tent of enriched baked goods in thiamine, niacin, and iron is thus brought to the desirable high levels of these constituents found in similar products made from whole-wheat flour

"The continuance of these benefits to the nation's nutritional standard is not non assured beyond the duration of the emergency The compulsory enrichment of baker's white bread and rolls terminates with the resolution of the wartime powers of the War Food administration The problem then reverts on the individual states as to whether enrich ment of these foods will continue to be required Legislation at the federal level would affect only those products handled in interstate commerce

## CONFERENCES ON THERAPY

Departments of Pharmacology and Medicine, Cornell University Medical College and the New York Hospital, January 11, 1945

THESE are stenographic reports, slightly edited, of conferences by the members of the Departments of Pharmacology and of Medicine of Cornell University Medical College and the New York Hospital, with collaboration of other departments and institutions. The questions and discussions involve participation by members of the staff of the college and hospital, students, and visitors. The next report will appear in the August 1 issue and will concern "Digitalis vs. Digitoxin"

# The Treatment of Subacute Bacterial Endocarditis

DR HARRY GOLD The outlook for the patient with subacute bacterial endocarditis was practically hopeless up to about 1936 If one puts together a fair sample of the reports in the literature up to that time, there is the indication that about 1 per cent of these patients recover spontaneously However, most physicians who encounter patients with subacute bacterial endocarditis in the course of their practice never have seen one who survived the disease What treatment was applied might have played some part in prolonging life, but seemed to add little or nothing to the chance of survival began to change with the appearance of the sulfonamides Sterilization of the blood stream became a fairly common experience appeared on the scene cases of unequivocal cures The over-all results, however, were far from satisfactory In most cases the sterilization of the blood stream was only temporary instances of dramatic results were reported with massive doses of the sulfonamides which were sufficient to produce alarming suppression of renal function While the cures still remained few, their numbers were way outside of the range of those found in the presulfonamide period one report which summarized the experiences with nearly 200 cases, the cures were 6 per cent The incidence of cures seemed to have been boosted by additional measures, the use of heparin and hyperpyrexia The combination of sulfonamide with heparin, as suggested by Kelson and White for the purpose of controlling the fibrin deposition on the valves, yielded the figure of about 12 per cent cures The demonstration that sulfonamide became about 100 times more effective with an increase in the temperature from about 99-102 F  $\,\mathrm{sug}$ gested the use of hyperpyrexia together with the The body temperature was raised to levels of 104 F or higher for many days either by diathermy or by intravenous injections of typhoid-paratyphoid vaccine This form of treatment was stated in one report to cure 20 per cent of the patients These promises were not ful-

filled and with the use of the sulfonamides it still remained the common experience that a disappointingly small number of victims of subacute bacterial endocarditis could expect to survive the disease

The use of penicillin has opened a new chapter in the therapy of subacute bacterial endocarditis The initial experiences were quite discouraging In the way in which it was first used it was clear that penicillin could sterilize the blood stream in some cases, but the results were only temporary and the patients eventually succumbed first report by the Committee on Therapeutic and Other Agents of the National Research Council in August, 1943 contained an account of unsuccessful experience with penicillin in 17 pa-Then came the report in January, 1944, by Loewe and his collaborators with an account of 7 consecutive cases of subacute bacterial endocarditis successfully treated with a combination of penicillin and heparin While at the time of the report the patients had remained with negative blood cultures and were free of clinical signs of the disease for periods of only about two to five months, and while the permanence of the apparent cures still remained in doubt, their results are of unusual interest, since they suggest the possibility that with the appropriate use of penicilin the cure of subacute bacterial endocarditis has come within our reach This group of workers has had a great deal more experience since that report and we are fortunate in having Dr Leo Loewe here to open the discussion this afternoon on the status of the treatment of this disease at the present time

Dr Leo Loewe Our present clinical investigation of subacute bacterial endocarditis, as published in the J.A M A about a year ago, was suggested by the results of experiments in the rabbit. These animal experiments showed that fibrin and blood elements served as an impenetrable barrier protecting the offending organisms, which lay deep in the vegetations, from circulating chemotherapeutic agents. To accomplish disappearance of vegetations, the combined use

of a suitable chemotherapeutle agent and an anticoagulant was required. Heparin was successfully employed in these experimental animals to arrest the deposition of blood platelets and fibran. Relatively fresh artificially induced thrombi in the animal disappeared through the use of the anticoagulant.

Human postmortem material corroborated the observation that heparin may reduce endocardial vegetations. It is a recognized fact that heparin, by preventing accretions to the thromhus, accelerates the healing of thrombotic lesions

in general

Our early clinical experiences were unsuccess ful. The shortcomings of the intriveuous administration of heparin were overcome by the subcutaneous deposition of the drug in n special medium. In cooperation with Roche-Organon, Inc., we adopted the Pitkia menstruum, composed of gelatin, dextrose, and glacial nectio acid and water in definite proportions. This accomplished a slower and more equable absorption of heparin.

The combination of sulforamides and beparin yielded results not very different from the occasional spontaneous cure. When suipplies of penicillin were made available to us through the courtesy of Mr. John L. Smith, of the Charles Pfizer Company, and later also through the cooperation of the National Research Council under the acgus of Dr. Chester S. Keefer, the technic was modified by the replacement of sulfonamides.

with penicillin.

The administration of heparin and the determination of the optimum desage are gauged by the tilt-tube Lee-White modification of Howell's method for determining the blood coagulation time.

A reading of thirty to sixty minutes is indication time above one hour is wasteful of the drug and may indeed be hazardous, particularly if the clotting time is prolonged to two or more hours. The subcutaneous deposit of 300 mg of heparin every second or third day, or approximately 200 mg daily in the form of the aqueous commercial product in the venoclysis suffices. Hyperroactors require lesser amounts of heparin and hyporeactors, of course, need additional dosage

The estimation of penicillin dosage presented greater difficulty. Sensitivity tests of the organisms were made. Most of them were inhibited by dilutions of from 0 007 to 0.5 Oxford units of penicillin per cc of test broth. The daily dosage of penicillin to date (January 11, 1945) varied from 40,000 to 2,250,000 Oxford units. The total individual dosage ranged between 867,000 and 95,620,000 units. The available preparations of penicillin are so free of toxicity that the

latter amount was introduced without significant

Because of the early limitations in the supply of penicillin, an effort was made to reduce the span of treatment to a minimum so that material might be available for as many patients as possible Additional courses were given whenever necessary, and were well tolerated. In our earlier experiences, multiple courses were not uncommon in the advanced cases. However, our present procedure is to give one span of treatment sufficient to obviste the necessity for retreatment. We feel that desages chould be revised upward promptly and drastically in order to achieve sterilization of the blood etream for at least five consecutive weeks before interrupting treatment.

As our expenence expands, particularly with problem cases such as penicillin failures, and we have acquired a number of these, it appears that an avorage daily dose of at least 300,000, and preferably 500,000 Oxford units, is desirable Increased dosage or a more prolonged span of treatment is necessary for patients who are deteriorated or who show severe clinical manifestations of bacterial activity, such as embolization, marked eplenomegaly, and violent temperature reactions. Additional factors that enter into the determination of the dosage level are the sensitivity of the organism to penicillin and the capacity of the patient to develop and maintain an adequate level of the drug in the blood

To be therapeutically effective, penicillin blood levels must be far in excess of the in vitro bactericidal requirements. The best clinical results are achieved when the dose of penicillin is sufficient to maintain n blood serum level of at least 5 to 10 times that indicated by the in vitro test Chinical and laboratory observations indicate that there is a bacteriostatic zone of penicillin concentration which is superseded by a bacteri-

cidal zone at higher concentrations

Pencillin is nontoxic in massive doses up to 30,000,000 Oxford units per day. The response to massive doses is much more prompt and sustained. Low dosage invites failure, and the organisms may acquire resistance that is so high as to render future therapeutic levels virtually unattainable. In at least one instance we observed a fortyfold increase in the resistance of the organism to penicillin.

Some patients lack the capacity to develop effective blood penicillin levels because the organism is relatively insensitive to penicillin, more often because the drug is excreted too fast. In them it is necessary to naine methods for the enhancement of the blood levels. It occurred to Dr Carl H Beyer and his associates, of the Modical Research Division of Sharp and Dohme, Inc.

that it might be possible to suppress the tubular secretion of penicillin by the simultaneous administration of para-aminohippuric acid, which is also excreted by the renal tubular epithelium The intravenous administration of para-aminohippuric acid at such a rate as to make plasma concentrations of about 30 mg per cent increased penicilin plasma concentration 21/2 to 4 times This invaluable contribution to penicillin therapy by Dr. Beyer and his associates has been confirmed by us Through the kindness and cooperation of Dr John Henderson, Medical Director of Sharp and Dohme, Inc , and with the additional guidance of Dr Beyer, our group has conducted experiments along these lines in patients with subacute bacterial endocarditis cause of certain technical difficulties and the limited supply of para-aminohippuric acid we have only a few experiments at the present time

We have tabulated the results in 4 patients who received from 500,000 to 2,000,000 units of penicillin simultaneously with 60 to 100 Gm of para-aminohippuric acid per day in the same intravenous drip for periods as long as eight days. The para-aminohippuric acid blood levels did not rise above 21 mg per cent, as against the optimum levels of at least 30 mg per cent. The results confirm the fact that para-aminohippuric acid levels about 10 mg per cent enhance the blood levels of penicillin. Further work is in progress and will be reported at a later time.

It is our impression that by the use of huge doses of penicilin alone, up to 30,000,000 units a day, without enhancing agents, it is possible to impede penicillin excretion by the process of overwhelming the function of tubular excretion In this manner blood penicillin assays of as high as 60 Oxford units per cc have been achieved These figures sound astronomic, but it is important to remember there are organisms which in the test tube require that amount of penicilin to destroy them These represent the penicillin We hope that in time, with the aid of the para-aminohippuric acid expedient and with the huge doses of penicillin, we may obtain cures in these cases also

It is our custom to devote the first few days of therapy to the determination of penicillin levels following intramuscular and intravenous administration of the drug. During this trial period, heparin is withheld primarily to obviate any dislodgment of loosely attached vegetations.

Our experience indicates that intravenous injection of penicillin is decidedly the method of choice. Fractional intramuscular injections result in the attainment of a higher peak which cannot be maintained and which is followed by a prompt and abrupt decline so that, for a sizable fraction of the treatment day, the blood is vir-

tually free of detectable amounts of penicillin In contrast, the continuous intravenous injection produces a constant and sustained level rarely, when the patient is in congestive failure or there is a severe pyrogenic reaction, do we resort to continuous intramuscular administration We do not advocate the latter method because the levels, as we determined on numerous occasions, for the same daily doses, are 50 to 60 per cent of those by the intravenous method thermore, with the doses we now use the muscles become quite irritated and intolerant of the drug, and fever frequently occurs At the earliest possible opportunity, then, we turn to the continuous intravenous drip, employing minimum amounts of diluent In all instances, when available, Ringer's solution is employed as the vehicle The patient is placed on a salt-poor diet and heparinization is started as soon as the preliminary steps have been completed

Accessory therapeutic measures include the use of high-caloric, high-vitamin diets, supplementary multivitamin preparations, hematimics in liberal dosage where there is anemia, and frequent transfusions when indicated. The latter require temporary interruption of heparimization and hence are postponed, if possible, until the termination of penicillin treatment.

We have summarized the results of the treatment of subacute bacterial endocarditis due to Streptococcus viridans or nonhaemolyticus, using the combination of the intravenous penicillin and subcutaneous implants of the anticoagulant There were 62 consecutive and unselected patients, 60 of them with Str viridans and 2 with Str nonhaemolyticus The duration of illness prior to treatment varied from one to fifty-six weeks The penicillin sensitivity of the organisms varied from 0 007 to 0 5 Oxford units Fifty patients (81 per cent) may be regarded as having shown satisfactory results these, 46 are abve and many have resumed useful occupations, 4 have died of other causes were 12 failures (19 per cent) In this group there were 11 deaths from progressive circulatory failure, coronary occlusion, embolization, and lobar pneumonia This makes a total of 15 fatalities in the original 62 cases might have been better had we chosen to treat only those patients in the early stages of the disease and to eliminate those with manifestations of circulatory failure, ulcerative lesions, and embolic complications One cause for treatment failure in 3 patients was the refractoriness of the organism

In unreported studies made by Professor J M Sherman, of Cornell University, an attempt was made to establish a correlation between streptococcus type, penicillin sensitivity, and 01100

the clinical response Professor Sherman worked with twenty-four different organisms in our senes of 62 patients and established the presence of three different species Three patients were infected with a proviously unidentified streptone and designated Streptone.

feeted with a proviously unidentified streptococcus, now designated Str sbc, they were resistant to therapy and all three succumbed. A fourth patient infected with Str sbc is included in the fatal cerebral embolic group. Str sbc is not a miscellaneous collection of "unclassifiables," but represents an apparently homogeneous group with a unique combination of biologic characteristics and considerable immunologic homogeneity. Professor Sherman has been unable to isolate this streptococcus from the human mouth and throat, but has isolated it from the washings

of an infected sinus By contrast, 14 patients were infected with Str mitis, apparently more sensitive to penicilin, since 13 of these recovered, and only one died. Three patients were infected by Str bovis two of these recovered and one died. Significantly, the autopsy in the fatal Str bovis infection showed healed endocarditis. Our first treatment failure in a surviving pa-

tient was an instance of reinfection with another strain of a streptococcus Professor Sherman found that the organisms recovered from the blood stream during the first and second attacks were different. This suggests that the patient was cured of his disease, but not necessarily immunized to subsequent bacterial invasion. The original strain was Str salivanus, whereas the more recent strain was the more resistant Str she. This patient was retreated and was discharged some time ago as a recovered case, so far as the bacterial endocarditis within one year have taken their toll of the valve substance, and this patient is in moderate heart failure

It is a well-established fact that ombolization is a common complication of subscute bacterial endocarditis Embolization has also been attributed to the heparin, particularly in the presence of thrombotic vegetations on the heart valves. In order to ascertain to what extent treatment contributes to embolisation we examined the results in 10 of our patients. In 0 in whom embolic phenomena were present before treatment the treatment was successful Three patients in the first 26 of the series of 62 cases developed emboli during treatment and succumbed These are included among the treatment failures Since we have used the preliminary three-day course of intramuscular penicllin. we have encountered no cerebral emboli during treatment In one instance there was embolization after the treatment. That potient made a splendid recovery both from the infection and

from the hemiplegia which resulted from the vascular occlusion. These experiences indicate that embolization before the treatment is not a contraindication to the use of the heparin and pencillin, and that embolization occurring during and following treatment is more likely a manifestation of the continued progress of the underlying disease.

We have, then, recorded satisfactory results in 50 patients, 46 of whom are alive at this time Many have resumed their normal activities. Tho most recent patient has been observed for only two months, but the earliest member of the group was discharged from the hospital fifteen months In the favorable case, the temperature falls to normal, the patient experiences n sense of well-being, the appetite improves, embolic phenomena disappear, the splenomegaly recedes, as does the clubbing of the fingers, there is progressive gain in weight, improvement in the hematologic picture, and decrease in the sedimentation rate If the patient weathers the first two weeks after treatment without relapse, the need for retreatment seldom arises. This is particularly true with the present method of dosage schedules Naturally, the mechanical deformities of the heart valves result in varying degrees of diminution in cardine reserve Several factors determine the outcome of the therapy Those patients who are seen soon after the onset of the bacteremia, who have relatively small vegetations, and who do not suffer from circulatory failure, have the optimum chance for oure. provided their infection is by a penicillin-sensitive organism As Professor Sherman's studies have shown, infecting organisms vary greatly Apparently infection with Str mitia or bovis carries a much more favorable prognosis than that with Str sbe

A favorable outcome in 4 out of every 5 patients leaves no doubt that the beneficial results observed in this unselected series cannot be attributed to spontaneous recovery

Finally, and this cannot be stressed too much, we have included in our treatment program the elimination of foci of infection before permitting the patient to leave the hospital, and in this we have had the collaboration of Dr M D Levin. the oral surgeon at the hospital To prevent recurrence of the bacteremia, penicillin is administered parenterally and topically before and after the eradication of the focus In the beginning, we waited for recovery before looking into matters of focal infection We have revised this program so that we now investigate for foci of infection as early in the span of treatment as is consistent with the condition of the patient. This does not interrupt the treatment We have gained the impression that some of our patients

have been subjected to an unnecessarily long span or repeated courses of treatment because this program was not instituted earlier the eradication of the foci of infection there has been a prompt and satisfactory response to the treatment We regard this phase of the treatment as of considerable importance both as a curative measure and as an aid against reinfec-

We conclude from our experiences that age and set have no bearing on the outcome of the therapy, that the type of organism, apart from the so-called Str sbe, is immaterial, provided it is inhibited by penicillin within concentrations of from 0 007 to 0 5 Oxford unit per cc, and that, if the patient is in good physical condition, the duration of the disease is less than three months, and the causative organism is sensitive to penicillin, a satisfactory result may be anticipated in virtually every case

DR GOLD Dr Wheeler, you have had some experiences here at the New York Hospital in the treatment of subacute bacterial endocarditis Would you be willing to tell us about them?

DR C H WHEELER We have had about one fourth the experience of Dr Loewe patients with bacterial endocarditis due to nonhaemolytic Str alpha have been treated here under Dr McDermott Five of them died from heart failure or emboli during the period of treatment The penicillin seemed to have cured the other 10 We did not use heparin, and the penicillin was given intramuscularly, for the most part, rather than intravenously were those two differences between the New York Hospital cases and those of Dr Loewe

DR Gold Were your doses as large?

DR WHEELER I think none of our cases received as much as some of Dr Loewe's patients The average dosage was 200,000 to 300,000 units daily, and the average treatment period was between fourteen and twenty-one days Like Dr Loewe, we encountered a number of patients who were not cured by the original course of treatment or who relapsed soon after, but who did appear to be cured after further and more intensive treatment with penicillin

DR Gold Were the 10 cases you spoke of discharged from the hospital as cured?

DR WHEELER Yes Two of the 10 have been well for eleven months, 4 for six months, and 4 for a period varying between one and three

I think it is interesting to contrast this penicillin data with our own experience with sulfonamıdes here ın New York Hospital teria for the diagnosis and cure of the disease were the same with the two types of treatment treated 161 cases of bacterial endocarditis with

sulfonamides here in this hospital, only 3 of them can be considered cures, a little over 11/2 per cent

DR GOLD That sounds almost like the presulfonamide spontaneous recoveries

DR WHEELER Except that in New York Hospital there are no records of spontaneous What that means I don't know

Perhaps it means that our criteria for the diagnosis were a little more rigid or that we required a more advanced stage of the disease than in some of the reports in the literature in which as many as 3 per cent were cured Our records show patients who were thought to have bacterial endocarditis because they had rheumatic heart disease, fever, and blood cultures positive for Str viridans, but when they came to autopsy there was no evidence whatsoever of bacterial endocarditis They were apparently cases of rheumatic heart disease with transient bacteremin

Dr. Gold Dr Eggleston, would you like to add anything to these experiences?

DR CARY EGGLESTON This is a very extraordinary account that Dr Loewe gives us, and without casting any reflections upon the success that he has had, I would like to utter a word of conservative warning based not upon the experience with penicillin primarily, but upon experience with other efforts to control subacute bacternal endocarditis I think it is still a little bit early for us to judge just how successful this therapy will be Furthermore, I think that in all probability the success of therapy will vary proportionately to the thoroughness with which the method is carried out It is perfectly obvious to me from Dr Loewe's original report, which he cited, and from the subsequent data, that he studies his patients from every possible point of view and that he modifies his treatment to meet conditions discovered in the course of that study I don't think that that can be anticipated as the common practice when penicillin becomes sufficiently available to have it used more widely

I am very much interested in his remarks about the possible lytic effects of heparin for blood clot I would like to ask what his evidence is for the solution of blood clots by heparin as administered clinically

DR McKeen Cattell I would like to have Dr Loewe add also the evidence of the importance of heparin in establishing the superiority of the combined treatment in his cases

DR GOLD I would like to ask Dr Lichtman, who at one time summarized the literature on the various therapies of subacute bacterial endocarditis, for his opinion on the status as presented here today

DR S S LICHTMAN The term "spontaneous recovery" as applied to subacute bacterial endocarditis requires definition. It applies to patients who present themselves with the earmarks of a "burned-out" disease—a large spicen, secondary anemia, a valvular lesion, and some old febrile disease—or to postmortem findings of healed subacuto bacteremia. It does not apply to the activo type of case we are discussing today. In these cases we start with no spontaneous recoveries.

The 4 per cent recoveries during the sulfonamide period is, therefore, a substantial figure. The supplementary methods, especially hyperpyrexia, raised the figure to 6.5 per cent These were not selected cases

We have novor been able to accept the reports of higher incidence of cures because they wore not well controlled Kelson and White obtained higher figures with heparm but they required that the sulfa drug first render the patient bactorafree before the heparin was started. Such a specially selected group would be expected to yield more cures without heparin.

I think that the early failure of Keefer's committee with penicillin was a matter of dosage

Dr. Gold The total doses in their August, 1943, report ranged from 240,000 to about 1,760,000 units in from nine to twenty-six days

DR EGGLESTON If I recall correctly, many of the patients received, over the whole period of treatment, the amount that is now given to the average patient in one day. There wasn't enough material available at the time

DR WHEELER I think that is the nature of Dr Loewe's contribution, and you correct me if I am wrong, after we decided that penicillin was ineffectual in the treatment of this disease, he showed that it was not so when very much larger doses were used.

DR GOLD Dr Loewe, would you like to take up some of the points which have been raised? How about the heparin?

DR LOIWE Shall we take that first or talk ebont penicillin dosage because that is etill the most important feature of the treatment? We have always contended that the penicillin component is the essential feature of the treatment

As Dr Wheeler has indicated, our contribution was to show that penicillin was effective in the face of evidence directly to the contrary. The figure is not 17 failures. The latest figures given by Keefer show 52 failures out of 55

DR GOLD The discussion by Dr Chester Keefer in the J.A M.A of March 4, 1944 (124 636), indicates that only 3 of 55 cases reported to the Committee were alive after one year of study It 18, of course, possible that many of these might have looked like cured cases at the end of six months. I don't know what the facts were However, Dr Keefer's eccount of cases in which

patients were not cured by even massive doses of peniellin gave little encouragement

DR LOEWE As for the heparm, only further experience will determine what part of the therany is essential and what part can be abandoned We started with the promise, based on animal experimentation, that an anticoagulant is needed. that fihrin and blood elements serve as an impenotrable barrier to effective chemotherapy. and that the organisms he so doop in the vegetations that they are well protected from the circulating drug. It seemed that the cures were better with heparin and chemotherapy histopathologic picture changed, the vegetations were now devold of fibrin We induced the disease in a series of heparanzed animals, in them the vegetations were puny and discontinuous But we realized at the outset that the heparin was not the most important part of the treatment

The essential feature is the massive dose of penicillin. It is this which has reduced this unyielding disease to one which promises to be 80 per cent curable. I should state again that our somes represents unselected cases. None were turned down. Some were badly deteriorated. I believe that eventually it will be recognized that doses of 200,000 or 300,000 units may take care of selected cases but will not do in unselected somes. Dr. Wheeler, were not those cases of yours rather highly selected according to the criteria of the Committee?

Dr. Wheeler That is right They were all infected with organisms proved to be highly susceptible to penicillin.

Dn. Lowe Our group treated 8 cases for the Keefer Committee. We selected them necording to their enterna. They had very sensitive organisms They received doses of 200,000 to 250,000 units a day One of them required retreatment and is well. Another was well about six months after cure of a Str salivanus infection, when he was reinfected with the more resistant Str sbe

DR Gold What happened to the other ax?

Dr. Loewe They are well

Dr. Gold For how long n period?

Dn. Loewz We started our first case in January, 1944, and we treated 1 every two weeks or so for the Committee until we had a total of 8 It is now about a year, and all 8 are well They had received the combined therapy of heparin and penicillin

Dr. Gold Could we get back to Dr Cattell's question about the heparin? That seems to be something that troubles n great many people How important is the heparin in your opinion? At the present time would you be willing to drop it?

DR. LOEWE No, not at present There are

.

There are the animal experiseveral reasons ments which suggest that it has value the indication that it prevents the deposition of blood platelets and fibrin But apart from that, it is not feasible technically to give large doses of pentullin, 2,000,000 units daily intravenously without heparin, for without heparin the treatment is often interrupted by complicating throm-And we insist upon the intravenous bophlebitis route because that is how we obtain the best The higher the levels blood levels of the drug Then there is also the the better the results fact that we have a series of treatment failures when penicillin alone was used, some with massive doses There are non about 14 of them They have gotten well with the combined ther-

This, of course, is not final proof, since the additional penicilin might have done it alone These are our reasons for using heparin. When sufficient proof accumulates showing that the results without heparin are equal to ours in series of unselected cases, we shall certainly be willing

to discontinue it

The heparin gives us no trouble We have had no accidents We use it very carefully We give it mostly subcutaneously in the retarding menstruum

DR GOLD Is it gelatin and ephedrine mixture?

DR LOEWE It is the Pitkin menstruum, composed of gelatin, devtrose, glacial acetic acid, and water, with vasoconstrictors to help retard absorption

Answering Dr Eggleston's question, we avoid the term "lytic" We don't know whether it is lytic. It is well known, in the case of a thrombophlebitic process in the lower extremity, that the thrombosis heals much more rapidly, if the tail is prevented from growing. Preventing accretions to the thrombotic mass should enhance repair. We don't think it dissolves the thrombus.

DR WHEELER If you are going to give the penicillin by continuous intravenous drip, why don't you give the heparin the same way rather

than subcutaneously?

DR LOEWE That is a perfectly valid question We have given it by the continuous intravenous drip, but we don't like it because it requires more supervision. One sets up a dripolator that will go for twenty-four hours, and if that dripolator exhausts itself in twelve or sixteen hours it does not matter as far as the penicilin is concerned, but it does matter if the heparin enters too quickly, so we prefer the heparin subcutaneously

Visitor Isn't subcutaneous heparin painful? Dr Loewe Yes, there is some pain because we deposit it subcutaneously rather than intramuscularly But it is transitory and vari-

able, and they are none the worse for it have not had to abandon it because of pain

DR WHEELER How large a volume of the menstruum do you give in a single injection?

DR LOEWE From 2 to 4 cc We are trying to reduce it, especially the content of glacial acetic acid, in order to eliminate irritation, the cause of the pain

VISITOR I would like to ask Dr Loeve if he thinks that para-aminolippuric acid is a valuable adjuvant, and, if it is, is it a toxic agent to the

kidneys?

DR LOEWE The para-aminohippuric acid is an important addition to our therapeutic program because we have problem cases. Now we don't get the easy ones. It has an adverse effect on the veins in certain concentrations. There are technical difficulties which have to be ironed out. But it is an important addition to the treatment, not the routine treatment of cases, but to the treatment of penicillin failures due to the fact that the patients are not able to build adequate penicillin blood levels.

DR GOLD Have you seen any toxic effects?

DR LOEWE None whatsoever We have given as much as 100 Gm daily intravenously for eight consecutive days. It is not toxic in animals and humans in blood concentrations of 80 mg per cent, which means up to almost 200 Gm a day.

Dr Eggleston The theory of the action of para-aminohippuric acid is still further overloading the excretory mechanism of the tubules?

Dr. Loewe Yes, there is competition between the penicillin and the acid for tubular excretion

DR EGGLESTON Have you seen any kidneys of animals or man having received these large doses of para-aminohippuric acid?

Dn Loewe I have not, sir, but I am guided by the report of others who found no kidney injury

DR JANET TRAVELL Would Dr Lowe tell us more about why he thought his patients were cured? To be sure of that is so important

Dr Loewe They look well When you get them together in a group, they look healthier than the doctors Most of them are back again in gainful occupations, some in arduous labor One man was spectacular in that he was on a chain gang about two months after lie was discharged We recaptured him and he is now working as a metal worker Some of them are working as waiters, housewives, etc., and they feel well Some of them, of course, as a result of the infection, have lost sufficient valve substance to compromise their cardiac reserve These are in mild failure, but they are well as far as their endocarditis is concerned The blood cultures are consistently negative. The blood picture remains good. The sedimentation rates, on which we place great rehance, remain normal. Then we have nutorsy specimens which show that the patients died because they had lost so much valve substance that the hearts could not make the necessary adjustments, but what valve remained was free of bacteria and all evidence of bacterial activity. Finally, we have the patient that came back with a reinfection, with one organism the first time and another the second time.

Dr. Travell What is the longest period of cure?

Dr. LOEWL Fifteen months By the way, that was our worst case He had previously received sulfonamide treatment. He was ill almost a year before we treated him

Dr. Gold How about the possibility of intramuscular injection instead of the intravenous drip? Isn't it a fact that by the intramuscular injection of such doses as 25 000 units at twohour intervals one should encounter no difficulty in establishing blood levels which fall within the range of the concentrations of penicillin required by most organisms which cause this disease, at least those levels shown by the sensitivity tests?

Dr. Loewe The levels are not high enough. and when a high peak is reached within thurty minutes, it falls off to subeffective concentrations within sixty to ninet; minutes. We have made large numbers of two-hourly intramuscular injections in dally doses up to 1,000,000 units. By the continuous lutramuscular route, which is much better than the fractional two-hour method, we obtain about 50 to 60 per cent of the intravenous penicillin blood levels. That is not had except for the fact that the muscles do not tolerate 1,000,000 units of penicillin a day Because we encountered myontis and fever reactions, we have had to abandon it the continuous intramuscular injection on occamons when the patient is in circulatory fallure, or there is a severe pyrogenic reaction, but as soon as possible we return to the intravenous route. That is, at present, the method of choice.

DR. Gold Dr Loewe, what is your opinion of

the recent experience of Drivson and Hunter with 20 cases of combined treatment, of whom 75 per cent were cired and in which the results with three-hourly intramuscular doses seemed about the same as the continuous intravenous method? They treated a few cases with the intramuscular drip of penicillin without heparin, and in these thoy seemed to have obtained equally good results. The majority of their cases received only nbout 200,000 units dally for about three weeks.

1450

DR LOEWD I think that such limited experionces may prove musleading. I am inclined to place a good deal of weight on our series of 14 patients to whom I have already referred, who represented failures with penicilian alone, but who were then cured by the combined treatment with penicilian and beparin. I believe that massive doses of penicillian combined with heparin hold out the best prospects for these patients at the present time.

#### Summary

Dr. Gold Subacute bacterial endocardities was nimost uniformly fatal until a few years ago With the use of the sulfa drugs, disappearance of the bacteremia became a fairly common expenence and occasional patients (4 to 6 per cent) were completely cured. The early experiences with The use of penicillin were quite discouraging massive doses of penicillin has brought this disease under control. Some regard heparin as an important adjuvant and recommend its subcutaneous injection in a special menstruum which retards absorption Others question the value of beparin The causative organisms of this disease vary widely in their susceptibility to penicillin, and for the more resistant cases para-aminohippuric acid given together with penicillin offers some promise of providing more effective penicillin blood levels Some prefer the intravenous Others have obtained satisfactory results by the intramuscular route. There still remains much to be done in order to establish the most effective desage and method of administering, but the fact seems fairly clear that 4 out of every 5 patients with subscute bacterial endocardities may now look forward to a cure

#### THE LIMITATIONS OF PENICILLIN

Delivering the first Lister lecture of the Society of Chemical Industry at Edinburgh, Sir Alexander Fleming the discoverer of penicillin said that, like the sulfonamides, penicillin is highly specific, affecting certain microbes but having little or no action on others. Ho thought it unlikely that we should ever get an antisoptic which would affect all microbes without being poisonous to some human cells. Thus we shall have to arm ourselves with a series of chemicals covering the whole range of microbe growth. In another respect penicillin is not perfect,

Dr Fleming sald, it is rapidly destroyed in the stomach and so is ineffective when taken by mouth. But there is still hope that chemists may be able to synthesuse it and then tinker with the molecule so as to remedy imperfections. Moreover there are thousands of other microbes which may manufacture antisepties even botter than penicillin or which may give a clue to the chemical linkages responsible for the destruction of bacteria. "The work is not finished. It is just beginning" he declared — J.A.M.A., Feb 10, 1946

# PENICILLIN IN PNEUMOCOCCIC ENDOCARDITIS OF AN INFANT WITH CONGENITAL HEART DISEASE

I Newton Kugelmass, M D, New York City

PNEUMOCOCCIC endocarditis is not uncommon in children with congenital malformations of the heart who succumb to attacks of pneumonia. Diagnosis is rarely made during life because the symptoms are obscured by the associated pulmonary process, but prolongation of the disease beyond the first week or recurrence after an apyrexial interval should lead one to suspect such a complication

#### Case Report

S M, a 15-month-old baby girl with patent ductus arteriosus, contracted a severe upper respiratory infection from her father. She was only moderately disturbed for several days when sudden increase in fever, aggravation of cough, and development of rapid respiration marked the onset of pneumonia.

There was moderate prostration with cold and clammy skin, ashen-cyanotic facies, feeble pulse, and labored breathing. The baby was placed in an ovygen tent at the Misercordia Hospital and given I Gm of sulfadiazine per kilo of body weight and supportive treatment. Consolidation developed over the right lower lobe with moderate dullness, bronchial breathing, and crepitant rales. Typing revealed Type XIV pneumococcus, moderate polymorphonuclear leukocytosis of the blood, and

equivocal blood cultures The temperature fluctuated between 95 and 105 F for four days, then similar signs appeared in the left lower lobe, com-plicated by bilateral otitis media Recrudescence Recrudescence of pneumonia kept the septic temperature up for another four days with subsequent fluctuation at about 100 5 F In the midst of apparent recovery the infant was overtaken suddenly and swiftly by spiking fever, intermittent chills, profuse sweating, persistent vomiting, and marked prostration were ashen pallor of the face, shortness of breath, attacks of cyanosis, and acceleration and deepening The lungs were free of pneumonic of respirations signs, but the heart revealed new murmurs, the systolic bruit becoming audible throughout the whole pericardium, the spleen became enlarged, petechiae appeared over the palate and conjunctivae, and the urinc contained red blood cells, albumin, and casts. The infant appeared to be struggling for every breath in the oxygen tent when 200,000 Oxford units of penicilin were given parenterally in divided doses at three-hour intervals, which arrested the process within thirty-six hours unique manifestations of acute endocarditis cleared completely and conspicuously Repeated examinations of the child since her discharge from the hospital have revealed the original cardiac findings and normal developmental progress

# EFFECT OF THE BLOOD SUGAR ON THE ELECTROENCEPHALOGRAM

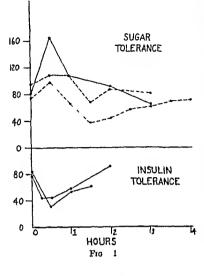

Walter Goldfarb, Maj MC, AUS

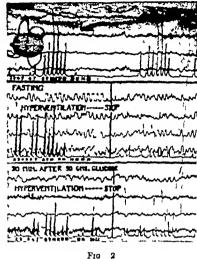

SINCE the beginning of the widespread use of the electroencephalogram clinically there have been numerous studies on the effects of various factors on the incidence and production of abnormal brain-wave patterns Lennov, Gibbs, and Gibbs (1936)1 studied the effects of drugs and their relation to clinical seizures In a later paper the same authors (1939)2 reported on the effects of blood sugar on the spike and wave pattern found in petit The latter study demonstrated that high blood-sugar levels diminished the spike and wave activity of the petit mal seizures It was thought of interest to report a single case of grand mal epilepsy due to hypoglycemic attacks in which the abnormal brain-wave patterns were abolished by the administration of glucose

#### Case Reports

The patient was a 22-year-old white girl, a second licutenant in the US Army Nursing Corps. She was admitted to the hospital after having two "fainting spells" during the month preceding her admission. She gave a history of having had four attacks of "fainting," the first at the age of 14, the second at 18, and the last two within the past month. She could not give a detailed history of the first two attacks other than that they were associated with not eating. The third attack occurred in the mess hall and was observed by the author. She had not

yet started to cat, and she suddenly collapsed while sitting at the table She was caught by her companions and lowered to the floor. There were minor clonic twitchings of the extremities and slight opisthotonus A slight dribble of blood came from the corner of the mouth, and there was no dif-ficulty in forcing a spoon between her teeth Examination of the mucous membrane of the mouth and tongue did not show any source of the blood She recovered in a few minutes and was not confused after the attack About three days later the patient was singing in church as a soloist, and she had what was described by other nurses as an exactly similar attack which again lasted a few minutes She was then admitted to the hospital for a thorough checkup She stated that each attack was preceded by a short aura of dizziness There was no loss of sphincter control during an attack, or confusion afterward, and the attacks were not associated with any emotional stress. The family history was entirely negative for epilepsy history was negative for any serious illness or opera-tion The patient's appetite was excellent, she Past medical frequently had severe headaches which disappeared on eating Routine physical examination was entirely within normal limits. Her deep and superficial reflexes were generally hyperactive, but equal on both sides The patient had poor hearing and with the audiomater tool and the have an with the audiometer test was found to have an average hearing loss of 40 decibels in both ears, and normal bone conduction It was felt that the pa-

tient had a bilateral otosclerosis of moderate sever-

Laboratory Studies —Rentine blood count revealed a slight secondary anemia with 3,38 million red blood cells. The urine was negative, and x-ray of the skull was normal Examination of the upper gastrolntestinal tract by means of x-ray, Sucroscopy and barium ingestion showed that the course of the duodenum was normal, and there was no evidence of any pancreatic enlargement visual ized. Repeated blood counts and urnalyses were also essentially negative. Three sugar tolerance curves are presented in Fig. 1 after the administration of 100 Gm. of glucoso by mouth. Curve I, taken on October 15, 1943, showed a low peak of 108 mg. per cont, followed by a drop below the fasting level at one and a half hours to 68 mg. per cent. It was repeated on December 5, and the peak of the curve was 168 mg. per cent at a half hour, and a drop below the fasting level at three hours to 67 mg. per cent. The third curve was obtained on December 18 after the attent was obtained on December 18 after the attent that half the contract of the contract tained on December 18 after the patient had been on a fixed diet for three days of 100 Gm, of carbo-hydrato per day

The peak of the curve at onehalf hour was 98 mg. per cent, followed hy a drop below the fasting level to 37 mg. per cent at one and a half hours and at the end of the test at four hours the blood sugar had not yet reached the fasting level. Two insulin tolerance tests were performed with 5 and 10 units of insulin intramuscularly The 10-unit dose produced a drop in blood sugar of 55 mg per cent in a half hour and the 5-unit dose dropped the level 38 mg, per cent in a half hour With the 10-unit dose the patient showed definite clinical signs of hypoglycemia in the form of sweating, tremors of the hands, and marked hunger No seizures occurred with either dose. The electroencephalogram studies are reproduced in Fig 2

and the four leads are indicated on the graph There was nothing abnormal in the electroen cephalogram obtained in the postabsorptive condi tion while the patient was resting. The frequen-cies described by the low frequency analyzer of Grey Walter (1043) were principally grouped about 10 cycles per second. Overbreathing cycled The frequena large, diffuse rhythmic Delta discharge and the analyser showed the components to be at 2, 3 6 8, 10, 13, and 14 cycles per second These abnormal 10, 13, and 14 cycles per second rhythms persisted for thirty to forty seconds after overbreathing. A second record taken a half hour after the administration of 50 Gm of glucose showed hardly any slow components either during or after overbreathing. Analysis of the frequencies showed a few components at 6 and 7 cycles per second, the principal components at 10 cycles per second, and a few rapid components at 20 cycles per second. The relatively normal response to hyperventilation after the administration of glacose suggests that the clinical picture of epilepsy in this case was related to the hypoglycomia.

We have observed similar brain wave changes in 3 additional patients which were also prevented by the administration of glucose either by mouth or by vein. There was no history of grand mal epilepsy in any of these cases, but they were all sont in for electroencephalogram studies because of disorders which were suggestive of epileptic equivalent.

<sup>\*</sup> The electroencephalogram studies were obtained through the kindness of Mr. Grey Walter 4 of the Burden Neurologica Institute, Bristol, England.

The frequentry of the occipital temporal lead was analysed by Mr. Walter's low-frequency analyser which covers the range from 1 to 22 cycles per second. The curve described by the analyser was filled in for clarify and labeled with the number of cycles per second represented

#### Summary

A case of epilepsy due to hypoglycemic attacks

was presented

The patient showed abnormal brain-wave patterns during hyperventilation which were prevented by the administration of glucose

# CONGENITAL ELEVATION OF THE SCAPULAE WITH BILATERAL OMOVERTEBRAL BONES

ROBERT E INGERSOLL, M D, West Haverstraw, New York

(From the New York State Reconstruction Home)

EULENBERG<sup>1</sup> published in 1863 the first report of the clinical picture of congenital elevation of the scapula This was followed in 1880 and 1883 by two separate reports by Willet and Walsham \* However, Sprengel, \* who described 4 cases in 1891, was the one whose name has since been commonly associated with this deformity first bilateral case was reported by Honsell in 1899 Zesas, in 1904, collected one hundred reports from the literature Horwitz, in 1908, was able to collect 120 cases from the literature and added 16 previously unreported patients Sporadic reports of one or of a few instances of this deformity have appeared since The review of Smith in 1941 is the most recent large series available in the literature. It remained for Gricgs in 1924 to suggest the name "congenital high scapula" since, in his words "nothing can be elevated which has not been down and there is no reason to believe that the congenitally high scapula has ever been lower than is found at birth"

The surgical treatment of this deformity has not been considered by many—Sands, who presented a case in 1888, resected the curved superior border of the scapula—Schrock, in 1926, reported two patients on whom he performed extensive subperiosteal freeing of the scapula, resection of its superior portion and part of the spine, and attachment of the freed scapula to the lowest rib possible with sutures Smith indicated to some extent the undesirable consequences which may result from this procedure

Horwitz<sup>6</sup> reported some form of vertebroscapular union in 25 per cent of his cases, 79 7 per cent of which were bony union Smith reported 14 out of 50 cases with an omovertebral connection

It is interesting in relation to this report to note that bilateral cases represent approximately 10 per cent of cases reported and that the left shoulder is usually the higher, the clavicles make an angle of 25–30 degrees with the horizontal, and facial asymmetry with atrophy of one side is present both with and without true torticollis

The cause of the omovertebral connection has been the subject of discussion of two main schools of thought. One feels that it represents the suprascapular bone as is found in skates. The other, as represented particularly by Keith, is states unequivocally that it is similar to the omovertebral element of certain other fishes (dipnoi and sela-

chians), which joins the suprascapular bone to the occiput. He feels that the suprascapular bone in man is represented by the cartilage along the vertebral border of the scapula

The descent of the scapula from its embryonic cervical position to its ultimate thoracic level in adults has been established and has been well described by Lewis<sup>12</sup> and summarized by other authors <sup>2-3</sup> 11 13

Case Report

Case 1 (2985) —James M, a twm boy 51/2 years of age, was admitted to the New York State Reconstruction Home on January 9, 1943, with a diagnosis of malformation of both scapulae. The condition had been noted at birth and treatment had consisted of continuous observation in the State Orthopedic Clinic. General physical examination was essentially negative. The neck revealed a normal range of motion both actively and passively in all planes. There was prominence of the paravertebral muscles in the neck and particularly in the region of their attachment to the occiput. Facial asymmetry with a definite droop of the right

Fig 1 Preoperative x-ray showing high scapulae, omovertebral bones and fusion defect of the cervical vertebrae

F10 2 0 months postoperative x ray showing lower position of the scapulae and no ovidence of recurrence of omovertobral boocs

corner of the mouth and right side of the face was noted. The patient stood with the shoulders markedly clevated with prominent vertebral borders of the scapulac, especially the superior vertebral angle. The superior border of the scapula was promicent and was fixed at an angla of 15 degrees with the horizontal There was a palpable hindge of cartilagenous or osseous tissue extruding from the vertebral border of the scapula at the base of the scapular spine to the spinous processes of the fifth and sixth cervical variebras. There was a palpable suggestion of a midlioe defect from the fourth cervical to the first dorsal vertebra. The scapular spine was promined, suggesting atrophy of the supra and infraspinatus muscle groups. Anteriorly the coracold processes were very promineot. The left shoulder was one inch higher than the right. The clavicles made an angle of 30 degrees with the bori The left There was no clinical ovidence of scollesis. Motion of the scapulae was almost absent and clova-

tion of the arms was possible to only 90 degrees.
\[ \rms \] rays revealed elevation of both scapulae with the superior angles at the level of the fifth cervical Bilateral omovertebral bones were presvertehm ont and there was a midline fusion defect from the fourth cervical to the second dorsal vertebrac

Extensive release of the scapulae was considered but decided against because there was no certainty that the result would warrant the risk involved. It was felt that subperiosteal resection of both omovertobral bones would yield increased mobility of the arms

On January 28 1943, under general anesthesia, the omovertebral bones were exposed and removed subperiosteally These structures showed osseous umon to the tip of the fifth carvical vertehrs on the right and the fifth and sixth on the left, and cartilagenous omen to the scapulac. The left bone measured 5 by 1.5 by 1.0 cm, of which 3.5 cm of its length was bony

The right was 4.5 by 1.5 by 10 cm, of which 3.5 cm of its length was bony

Follows and 20 cm, of its total length was bony

Follows lowing removal of these structures a markedly increased passive mobility of both scapulae was obtained. The postoperative course was uneventful

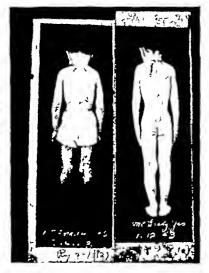

Fig 3 Right-preoperative, Left-postoperative,

and physical thempy in the form of gymnastics was instituted.

Ro-examination on September 15 1943, nine mooths after operation, revealed cootinued high position of the scapulae but with active elevation of the arms to 150 degrees. A-rays at this time showed no evidence of recurrence of booy growth in the beds of the previously removed booss.

Sixteen months postoperatively oo May 11, 1944. examination revealed maintenance of the range of elevation to 150 degrees. There is palpable sug gestion of recurrence of bony growth in the bed of the left emovertebral element.

This, then, is the presentation of a case of hilateral coogenital high scapuls with hilateral omovertebral bones which was treated by surgical removal of these structures yielding functional improvement to date and with some cosmetic benefit.

## Admiral Stephenson to Direct Cancer Study

REAR Admiral Charles S Stephenson, USN, retired, former director of the department of Hygicne and Preventive Medicine of the United States Naval Medical School, has been appointed acting managing director of the American Cancer Society to succeed Dr Clarence Cook Little Dr Little will direct studies of genetic factors of intelli-

gence and emotional variations in mammals under a Rockefeller Foundation grant

Some months ago Admiral Stephonson took over the direction of the Research Division of the Cancer Society, to which approximately one third of the funds gathered in the \$5,000,000 cancer drive were assigned

#### Dr Sabin Receives Trudeau Medal for Tuberculosis Work

THE Trudeau Medal of the National Tuberculosis Association was awarded to Dr Florence R Sabin, of Denver, anatemist, noted for her work on the pathology of tuberculosis and on the origin, nature, and activities of the white blood cells, at a meeting of the association's executive committee in the Hotel Pennsylvania on June 6

The award, given annually for "meritorious contribution to the cause, treatment, or prevention of tuberculosis," is the lighest honor in the field of tuberculosis. It was established in 1926 in memory of Dr Edward Livingston Trudeau, the associa-

tion's first president

Dr Sabin, a member of the association's committee on medical research, received the award for her extensive studies of the physiologic activities of the chemical fractions of the tuberclo bacillus

Election of Dr John Alexander, of Ann Arbor, Michigan as president-elect of the American Trudeau Society, medical section of the association, was also announced Dr Alexander, who is chief of the division of thoracic surgery, University of Michigan Hospital, will assume office in one

Dr Ezra Bridge, of Rochester, succeeded to the

1945 presidency on June 6

# New Itch Remedy Proving Satisfactory

A NEW 1tch remedy, called Circa 42, developed by scientists of the US Department of Agriculture's Research Administration, relieves skin irritations caused by bites or stings of insects, such as chiggers, mosquitoes, spiders, wasps, and others, or by fungous infections, poison ivy, and "unknown" Limited tests on persons in this country and in tropical areas have indicated Circa 42 to be a promising remedy for relief of itching skin for all but a few of those n ho have tried it

This remedy can be prepared by any druggist who has the ingredients, from the formula de-

veloped by Dr J Franklin Yeager and Charles & Wilson, entomologists at Agriculture's Researc Center at Beltsville, Maryland. Circa 42 is doughy, nongreasy, cake-like material, which i applied by hand in a thick layer over the itchin regions, but not rubbed in It is made of fiv materials, two of which produce a local skin ance thesia, without harm to the skin

The formula for Circa 42 is as follows—n-butyl

The formula for Circa 42 is as follows p-aminobenzoate, 100 Gm, benzyl alcohol, 170 ec anhydrous Ianolin (melted), 20 ec, eornstarch, 64

Gm, sodium lauryl sulfonate, 64 Gm

# Wartime Graduate Medical Meetings Held in New York

FOUR Wartime Graduate Medical Meetings, under the auspices of the American Medical Association, the American College of Surgeons, and the American College of Physicians, have been held Dr O R. Jones is chairman for the New York region, and on his committee are Drs Norman Jolliffe and H W Cave

On May 18 in Grand Central Palace Dr Nathan

Rosenthal spoke on "Deleterious Effects of Drug on the Hemopoeitic System," on May 25 in the same place Dr H D Kruse delivered a lecture en titled "Deficiency States and Their Recognition" On June 4, at Mitchell Field, Dr David P Bar discussed "Treatment of Thyrotoxicosis" and Dr Henry E Meleney talked on "Diagnosis and Treatment of Malaria"

#### County News

#### Albany County

Capt A J Vinci, of Cohoes, serving with a medical detachment of the Army in Germany, has been awarded the Bronze Star "for meritorious achievement," according to word received on May 7

The citation accompanying the award says the physician's "initiative and courage in braving mined and booby-trapped paths to establish an alternate route to evacuate casualties were directly responsible for saving the lives of many wounded men".
This action took place on February 27 and 28 \*

\* Asterisk indicates that item comes from a local news-

A special meeting of the county society was lick on June 6, at 8 30 P M, at the Albany College o Pharmacy Harry E Northam, executive secretary of the Association of American Physicians and Surgeons, of Gary, Indiana, was the speaker

#### Bronx County

The regular meeting of the county society was held at the Concourse Plaza Hotel on May 16 at 8 30 PM The scientific program consisted of a lecture by Dr Frank H Lahey, of the Lahey Clinic, in Boston, entitled "Lesions of the Stomach—Duodenum and Jejunum," followed by discussion by Drs Benjamin Sherman and Sarmal Weishouf by Drs Benjamin Sherwin and Samuel Weiskopf

Dr L W Gorham, professor of medicine, Albany Medical College, was guest speaker on May 8 at the semiannual meeting of the Columbia County Medical Society held at the Columbia Golf and Country Dr Gorham spoke of the use of pemcilin for generalized infections, infections of the nervous system, and for pneumonia

A business meeting, at which Dr J W Mambert presided, and a dinner preceded the program, which also included a sound film on nutritional deficiencies Capt Roger Bliss, home on leave, told of his ex-

perionces on Leyte and Luzon

#### **Dutchess County**

Dr Robert H Breed won a kickers' handicap tournament of the Dutchess County Medical Society on the golf course of the Hudson River State Hospital on May 9 The medical staff of the hospital was host to the society members at the golf match and a barbecue, which preceded a regular business meeting of the society

Dr Donald Malven presided at the meeting which was featured by a scientific discussion on "Cancer of the Breast" The session was led by Dr Julian Herrmann, of Memorial Hospital, New York City \*

#### Kings County

Seven Catholie laymen designated for knighthood in the Order of St Gregory by Pope Pius XII were invested on May 6 by Bishop Thomas E Molloy, of the Brooklyn Diocese The ceremony was witnessed by five-hundred persons at the Church of St Francis Xavier

The new knights, named for their services to their faith and charitable work in the diocese, include two jurists, two physicians, an editor, an engineer, and a

former shipping executive
Physicians honored were  $\mathbf{Dr}$ Thomas M Brennan, assistant clinical professor of surgery at Long Island College of Medicine, a member of the board of trustees of the Medical Society of the State of New York, and president of the medical board of St Mary's Hospital, and Dr Thomas A. McGold-rick, director of medicine at St Anthony's Hospital and from 1943 to 1944 president of the Medical Society of the State of New York \*

The joint medical staffs of Kings County and Calcdonian hospitals gave a dinner on May 12 to Dr Joseph Tenopyr, president of the Kings County Medical Society, the Kings County Medical Board, and the Medical Board of the Caledonian Hospital

The dinner, a benefit for overseas members of the Kings County medical umt, was attended by five hundred who paid tribute to Dr Tenopyr's long service in county medical circles The event was at

the Towers Hotel.

Maj Gen Charles R. Reynolds, former surgeongeneral of the army, represented the American College of Surgeons and Dr Robert F Barber, of the Long Island College of Medicine and the Long Island College Division of Kings County Hospital, was toastmaster Edward M Bernecker, Commissioner of Hospitals for the City of New York, was principal speaker

Other speakers were the Rev Dr Alfred Grant Walton, of the Flatbush Congregational Church, who offered the invocation, Donald G C Sinclar, president of Caledonian Hospital, and Dr Charles

A Gordon, head of the local chapter of the American The chairman was Dr John College of Surgeons Brinkman \*

For remaining at his post after being wounded, Capt Shepard G Aronson, a Brooklyn doctor, has

been awarded the Bronze Star Medal.

The 32-year-old doctor received an eye injury while directing officers and enlisted personnel in an operating room on one of the Philippine Islands last While shells struck the front of the building and flying glass, plaster, and shell fragments caused casualties in the operating room, the doctor, who was told by his commanding officer that he could leave, continued his work

"He had about ten The citation read in part hours rest during the five-day period Through his tireless, skillful, and creditable behavior, not only lives and limbs were saved, but hundreds of people were influenced into a spirit of order at a time and

place threatened by chaos"

Captain Aronson has received the Purple Heart He enlisted in the medical corps three years ago and was sent overseas in December, 1943

#### Monroe County

John R Murlin, Ph D, professor of physiology and director of the department of vital economics, University of Rochester School of Medicine and Dentistry, Rochester, retired on July 1 Dr Edwin Fauver retired at the same time as head of the physical education department and college The men have been connected with the Rochester faculty for twenty-eight and twenty-mine years, respectively

#### Nassau County

The annual meeting of the county society was held on May 22 at 9 00 PM in Mercy Hospital Auditorium, Rockville Centre The scientific session consisted of movies entitled "The Invasion of Normandy" and "The Battle of Marianas," presented through the Public Relations Office of the United States Navy

#### New York County

More than seven thousand physicians have visited the Drug Exhibit of the New York Academy of Medicine, which was inaugurated on October 9 of last year. The exhibit was dismantled in June and a new exhibit will be opened in October, 1945

The drug exhibit represents an innovation in the educational services of the Academy and it has definitely proved its worth and usefulness objectives of the exhibit, to permit the medical practitioner to familiarize himself with the newer drugs, their appearance, the forms in which they are available, their methods of administration, their dosages dangers, contraindications, etc., have been well realized. The exhibit is primarily educational, and not promotional.

The first drug exhibit was restricted to items bearing on the treatment of infections. The new exhibit, to be opened on October 1, will be unrestricted and will include a variety of significant and new

therapeutic agents

Participation in the exhibit is limited to those organizations invited by the Task Committee, of which Dr Theodore G Klumpp is chairman 'The Academy Committee on Drug Exhibits passes on

died on September 14, 1944, at the age of 68 received his medical degree from the University of Wurzburg in 1901, and was on the staff of the Sydenham Hospital He was a member of the Medical Society of the State of New York and the American Medical Association

Carlin Philips, M D, of New York City, died on February 8 at the age of 74 Dr Philips was graduated from the University of Michigan in 1897, and was formerly adjunct visiting physician at the Fourth Division, Bellevue Hospital He was a member of the New York Academy of Medicine

Emery C Pixley, M D, of Canisteo, died on April Dr Pivley received his medical degree from the

University of Buffalo School of Medicine in 1891
Fritz Rubinstein, M D, of the Bronx, died on
December 6, 1944, at the age of 48

Dr Ruhinstein was graduated from the University of Berlin in 1924, and was former associate surgeon at St Joseph's

Hospital in the Bronx

Ord Ledyard Sands, M D, of Binghamton, and formerly of New York City, died on January 23 He was 73 years old Dr Sands was graduated from Bellevue Medical College in 1911, and before going to Binghamton was assistant physical therapist at the Vanderbilt Clinic He was a member of the American Congress of Physical Therapists, the Medical Society of the State of New York, and the American Medical Association

Herman Schwarz, MD, pediatrician, of New York City, died on May 19 of a heart attack at his summer home in Bedford Village He was 68 years

old

Dr Schwarz was graduated from the College of Physicians and Surgeons, Columbia University, in 1898, and did postgraduate work at the University of Berlin At the time of his death he was a consulting pediatrician at Mt Sinai Hospital, president of the medical board and head of the department of pediatrics at Beth Israel Hospital, and clinical professor of pediatrics at Columbia University, College of Physicians and Surgeons He was a licentiate of the American Board of Pediatrics, a member of the Academy of Medicine, the Medical Society of the State of New York, and the American Medical Association

Charles J Search, M.D., of Brooklyn, died on June 5 at the age of 81 An x-ray specialist, Dr Search was a consultant for St Giles and St John's hospitals in Brooklyn He was a graduate of the University of Wooster, class of 1892, and a member

of the Kings County and State medical societies and the American Medical Association

Arthur E Smith, M D, of Cohoes, died on May 14 in that city, where he had been a practicing physician for 53 years He was 83 years old He received his medical degree from the University of Vermont in 1891, and shortly thereafter began his practice in He was a veteran of World War I, having served as a captain with the medical corps

Henry G Storner, M D, of Olean, died on May 15 after a brief illness He was 46 years old graduated from the University of Buffalo School of Medicine in 1923, and interned at the Sisters and Deaconess hospitals in Buffalo He began the practice of medicine in Andover and in 1927 moved to He was a member of the Cattaraugus Coun-Olean ty Medical Society, the Medical Society of the State of New York, and the American Medical Association, and was on the staffs of the Olean General and St Francis hospitals

Willis Carver Templer, M D, of Corning, died on May 12 at the Clifton Springs Sanitarium director of the Corning Glass Works, he was also a surgeon at the Corning Hospital, and a consultant in industrial hygiene at Strong Memorial Hospital, in He received his medical degree in 1920 from the University of Buffalo School of Medicine, and was a member of the Steuben County and State medical societies and the American Medical Associa-

on He was 48 years old Joseph Abbott Thissell, M D, of Tupper Lake, died on May 13 of arteriosclerosis and terminal pneumonia at the age of 86 Dr Thissell was graduated from Harvard Medical School in 1885 He practiced in Boston, Beverly, Massachusetts, his birthplace, and New York City, before going to Tupper Lake fifty-seven years ago. He was a member of the Medical Society of the State of New York and the American Medical Association

Robert Taylor Wheeler, M D, of Brooklyn, died at the ago of 76 on June 6 following a cerebral hemorrhage which he had suffered two weeks previously Dr Wheeler retired last November after fifty-two years of practice in Brooklyn He was formerly on the staff of Bethany Denconess Hospital and consulting physician at Peck Memorial Hospital in Brooklyn Born in Jersey City, he was graduated from Yale University in 1888, and in 1892 received his medical degree from the College of Physicians and Surgeons, Columbia University He was a member of the Kings County and State medical societies, and the American Medical Association

# ACADEMY OF MEDICINE HELD CLINICAL RESEARCH MEETING

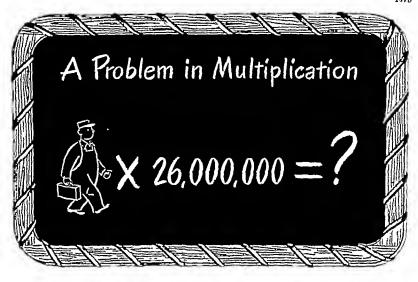

The New York Academy of Medicine held a meeting Wednesday evening, May 16, to provide a forum in which research workers of New York City and vicinity may present results of original research in clinical medicine

This meeting was arranged by the Committee on Medical Education of the Academy in view of the dearth of meetings of national medical societies before which research work has usually been presented

Presentations were limited to twelve minutes A brief period of free discussion followed each presentation

The subsequent publication of presentations was not a necessary condition but the Academy planned to publish in the Bulletin abstracts of presentations if the author so desired The fact that material has in substance or in part been presented elsewhere was not regarded as a bar to presentation, provided that the work represented recent research

The Committee extended an invitation to all research workers of Greater New York and neighboring cities within a radius of one hundred miles, to submit abstracts, not to exceed two hundred words in length, of proposed presentations, to the Secretary of the Committee on Medical Education of the Academy, 2 East 103 Street, New York City 29, not later than April 5, 1945 A formal invitation to participate in this program was then extended by the Committee to the authors of papers selected for presentation

Take the case of John Smith, average

For over three years now he s been buying War Bonds Putting away a good chunk of his earnings regularly

#### He a accumulating money

Now suppose everybody in the Payroll Plan does what John Smith is doing Suppose you multiply John Smith by 26 million.

#### What do you get?

Why—you get a whole country that a just like John Smith! A solid, strong healthy, prosperous America where everybody can work and earn and live in peace and comfort when this war is done

For a country can't help being, as a whole, just what its people are individually!

If enough John Smiths are sound—their country's got to be!

The kind of future that America will have—that you and your family will have—is in your hands.

Right now, you have a grip on a wonderful future Don't let loose of it for a second.

Hang onto your War Bonds!

#### Seven New Hospital Ships to Speed Wounded Back

GROWING fleet of American hospital ships A will complete the joh of bringing home all transportable sick and wounded servicemen from Europe

within the next month.

Seven new ships to be added to the mercy fleet by midsummer will increase its numbers to forty and its carrying capacity from 20,000 patients to 30,500

As the Army's Atlantic Fleet completes its task of evacuating casualties, the twenty ships will be diverted to Pacific waters

The US A.HS Dogwood is already Pacific-bound, the OWI said, to be followed shortly by the St Olaf and in June by the St Mintel, the Chatcau Thierry, and the Stafford Eventually, all Army hospital ships will operate in the Pacific, where the Navy thus far has been carrying the major burden.

"The new ships—including five already com-missioned this spring—are both larger and faster than most of those already in operation, and consequently will be able to hring the wounded home, especially from Europe, at a greatly accelerated rate," the OWI stated

At a cost averaging \$4,000,000 each, most of the ships have been converted from luxury liners, German and Italian vessels, Liberty ships, and former troop transports At the time of Pearl Harbor, this country had only two hospital craft, the Navy's Relief and Solace

Some of the new additions to the fleet, although larger, will cost less than was spent on others for conversion, the OWI said Each of six new Navy ships commissioned or to be commissioned this year is about twice the size of the average city hospital and capable of earrying about 800 patients

These ships are the first to be completely air conditioned, to have all berths equipped with radio receivers, and to have special fireproof decking have a speed of seventeen and one-half knots, a 12,000-mile cruising radius, and equipment which the OWI described as "equal to that in the finest metropolitan hospital"

The vessels are the Tranquility, commissioned April 24, the Haven, May 5, the Benevolence, May 12, the Consolation, May 21, the Repose, and the

Sanctuary, commissioned June 18

Two of six new Army hospital ships scheduled for commissioning this spring have already gone into service and completed their maiden trips. They are the Aleda E Luiz, formerly the French liner Columbie, renamed for an Army Air Forces flight nurse killed when her plane was shot down over France. and the Ernestine Koranda, also named for an Army

The other four Army ships will be the Frances Y Slanger, formerly the Italian luxury liner Saturnia, destined to be the largest and fastest hospital ship in Allied service, with a capacity of 1,700 patients, the Republic, a former German liner, the Howard A McCurdy, formerly the President Tyler, and the Armin W Leuschner, formerly the Willard A Holbrook

The hospital fleet will be brought to full strength by addition of the four new ships for the Army and

three for the Navy

# Hospital Fund Issues Directory of New York Clinics

A "DIRECTORY of Hospital Clinics Serving New York City," believed to be the first reference hook of its kind, has just been published by the United Hospital Fund The 74-page directory covers in detail the services offered by outpatient de-partments of the ninety-three New York hospitals

which conduct clinics
The directory is "the result of many months of inquiry and preparation of information received from the outpatient departments of voluntary and municipal hospitals of New York City," Roy E Larsen, president of the United Hospital Fund, points out in the foreword It was "designed for daily use hy hospitals, welfare agencies, social workers, and others who have need to refer patients to clinics"

Copies of the directory have been distributed to the listed hospitals and to social agencies and others who helped in the preparation of the book. Others who would like to have a copy may secure one from the United Hospital Fund, 370 Lexington Avenue, for \$2 00 while the limited supply lasts, Mr Larsen Because of paper restrictions only 1,500 copies have been printed

The clinics are listed under the hospitals to which they belong, and are cross-indexed by clinic classification. In the hospital listings, information is given as to district houndaries, residence and financial requirements, and outpatient department policy Each clinic is listed separately with the days and hours when patients are received for classification and treatment, the fees for first and later visits, and a statement of any special administrative policy of the hospital which may be in effect for that particular clinic

Hundreds of clinics, under twenty-nine main subject headings, ranging from allergy to x-ray therapy, are classified in the new directory

## Improvements

With the observance of National Hospital Day on May 12 the Deaconess Hospital, in Buffalo, officially opened its new addition, which nearly doubles the capacity and provides the latest advances in hospital equipment and facilities The public is invited to inspect the building

Constructed at a cost of \$750,000 (partly financed by the Government under the Lanham Act), the new wing adds two-hundred beds and gives the hospital a total capacity of four hundred and fifty

New laboratory, surgical, nurse-training, and eating facilities bring the Deaconess to the forefront of hospital services

Covering an area of 1,940 square feet, the pathologic lahoratory occupies a large portion of the first Departmentalized into basal metabolism and electrocardiography, bacteriology and serology, blood bank, hematology, urnnalysis and chemistry, The Makers of Autalgan

#### TO THE PROSPECTIVE MEDICAL STUDENT

"Don't take up the study of medicine in the kepe of getting rich," is an oft repeated statement made to prospective students by their physician advisers. We suppose that by the term "rich" they mean a wealth measured in gold and earthly assets. However we do not know of any other profession of which a like statement could not be made "Riches depend on one shillity to spend less than one earns and having saved, to have the ability to invest those savings whely. Many a man became "rich" on the prograph of the programment o

which a like statement could not be made "RIGHES depend on one as hint; to spend less than one earns and having awed, to have the ability to invest those savings wisely. Many a man became "rich" on the poor start of digging ditches for a dollar a day. But in another meaning, you will become rich in the practice of the Healing Art, rich in Joys that are unmeasurable. No other profession on Joys such extreme confidence of their clients, experiences the joy of presenting a mother with her new born child, has the trust of the family with their vory life and death. The community in which you live looks up to you and your advice is sought on multitudinous subjects, many of which you may know nothing about. Your name is not "mister," it is "Doctor" to distinguish you from the other people. At least you are a small toad in the pond and, according to your ability, you may be a big one. Medicine is full of riches.

Socialized medicine or the new order may lessen your joys somewhat, but there are so many that there are bound to be some left. So long as you are not lary and behave yourself, you may never be rich, but in return you will nover sturve The world will always have a place for you — W B Harm, M.D., in Detroit Medical News, Feb. 12, 1945

[Continued from page 1476]

and tissue pathology, the laboratory is divided into

separate rooms for each of these fields

In them are three new research-type microscopes, a large blood bank, a new serologic water-bath, a photoelectric colorimeter, a spacious bacteriologic incubator, two largemicrotomes, several new centrifuges, a new basal metabolism and electrocardiograph machine, a new analytic balance, and additional drying and embedding ovens

The fixed equipment—working tables, cupboards, etc —is designed for convenience, efficiency, and

The enlarged laboratory and its effective organization will enable the hospital to handle an increased volume of laboratory work and to expand its research activity

In a suite of twelve modern, well-equipped rooms, grouped to facilitate the handling of patients, viewing of films, and consultation, the x-ray department also is located on the main floor A special feature is the use of barium as a compound in the doors and walls of all the rooms to prevent the rays from

The patients' rooms occupy the second and thir l floors of the wing, with medical and maternity cases on the second floor and surgical on the third rooms have terrazzo floors made with white cement instead of the customary gray, to provide a more home-like appearance \*

#### At the Helm

Dr Malcolm R. Blakeslee, of Shortsville, has quit his local practice to assume the post of assistant physician at the Brigham Hall Hospital, Canan-He began full-time duties there on July 1 \*

As a step toward eventual organization of a department of hospital administration in the University of Rochester School of Medicine and Dentistry, Dr Basil C MacLean, director of Strong Memorial Hospital, has been appointed professor of hospital administration, a newly created position Dr MacLean has been director of the Strong Memorial Hospital since 1935, returning to the position last September after an absence of more than a year while he served in Washington as a lieutenant colonel in the medical corps of the army, as consultant in the surgeon general's office Dr MacLean is also in charge of a ten-member commission appointed by Governor Dewey to draft a program providing medical care for the state's needy to make recommendations for action by the state legislature

I W J McClain, superintendent of St Luke's Home and Hospital, in Utica, for nearly twenty-six years, has resigned his position there, to become effective as soon as his successor is named

During the time he served as superintendent the number of patients treated annually there doubled, until today the institution is caring for 4,000

McClain was one of the pioneers in the formation of the Hospital Plan for Utica. He brought people from outside the city to meet with representatives of Utica hospitals and out of that meeting developed the decision to organize He was active in getting the program started and is now both a director and a member of the executive committee of the Hospital Plan.

Prior to coming to Utica he was head of the department of sciences in the Huntingdon, Pennsylvania, High School and then served as registrar in the departments of medicine, dentistry, and pharmacy in Temple University

In 1925 and again in 1934 he served as president

of the Utica Council of Social Agencies \*

Dr Louis I Dublin, second vice-president and statistician of the Metropolitan Life Insurance Company, has completed his assignment as full-time assistant to Basil O'Connor, Chairman of the American Red Cross, and as chairman of the organization's Administrative Committee, and has resumed his duties with the insurance company Dublin will continue to assist Mr O'Connor in the long-term policies and plans of the Red Cross and will be active in relation to the operation of the New York City Chapters

During his seven-month period of service, Dr Dublin, among his other administrative duties, helped to reorganize the recruitment of nurses for war service and to coordinate the needs of the interested governmental departments and bureaus which were concerned with nurse recruitment. He was also particularly active in a survey of the medical and health work of the American Red Cross and i the preparation of a plan for expanded healt

services in the postwar period

Dr Dublin's services were requested by Mi O'Connor last fall because of his internation reputation in public-health work At the time c his appointment, it was stipulated by the Metre politan that he would be on loan for a limited period Dr Dublin also served with the Red Cross durin the first World War as a member of commissions r Italy and in the Balkans

#### Newsy Notes

The tenth anniversary of the Associated Hospital Service of New York, the largest of the nation's eighty-four "Blue Cross Plans," was celebrated during the week of May 7-12 with the cooperation of hospital officials, members of the medical profession, and representatives of industrial organizations, and civic and social groups throughout Greater New York The two-millionth subscriber to the service was officially enrolled during the week

"Ten Years of Public Service" was the theme of

meetings held during the week throughout the are: in which the plan operates Officers, executives and friends of the organization recounted its achieve ments and the difficulties surmounted during it development and discussed the problems still to be faced

The celebration was launched with a testimonia meeting sponsored by the Greater New York Hoppital Association on May 7 at the Einhorn Audi torium of Lenox Hill Hospital. The speakers in cluded Dr Morris Hinenburg, president of the Greater New York Hospital Association, Louis H

Pink, president of the Associated Hospital Service of New York, Dr William B Rawls, chairman of the Coordinating Council of the five county medical societies of Greater New York, and Miss Fannie Hurst, the first person to become a subscriber to the organization \*

The Board of Estimate of New York City approved on May 24 a site for the proposed \$6,034,000 general hospital to be constructed as a replacement

for Metropolitan Hospital on Welfare Island
The new hospital, also to be known as Metropolitan Hospital, will be erected on a two-part site, with both parts fronting on Second Avenue The westerly part will front also on East 97th and East The casterly part will front on East 98th streets River Drive, East 97th Street, East 99th Street, and First Avenue, as well as on Second Avenue

The new hospital project is listed in the 1945 capital budget, where its total cost is estimated at \$6,034,000 and its date of completion tentatively set for some time in 1947. It is anticipated that the Federal Government will pay half of the eost of the

project

The 1945 capital budget calls for an expenditure of \$2,767,000 by the city and a like sum by the Federal Government this year for plans, specifications, and land acquisition. The assessed value of the land on land acquisition The assessed value of the land on the site is \$956,550 and of the buildings \$284,500, for a total of \$1,241,050

Tentative plans call for construction of a nurses' home on part of the site facing East River Drive \*

In observance of National Hospital Day on May 12, the Veterans Administration Hospital in the Bronx was opened to the public from 1 00 PM to

Guided tours were conducted and guests had an opportunity to see such facilities as the surgery department, laboratories, dental clinic, and orthopedic shop A short concert was held at the end of the tour

Hospital Day was observed on May 12 at the Niagara Falls Memorial Hospital. The public invitation included all persons in the city, to visit the hospital between 5 00 and 9 00 PM and attend the reception in the nurses' home

An attractive booklet, commemorating the fifty years of service just completed by the hospital, will be distributed to guests and other interesting data

will be available

Open for inspection were the modern physical therapy department, the technically equipped laundry, the laboratory and blood bank, and tho new building provided by the United States government, the x-ray department, pharmacy, food department, surgeries, and other facilities \*

Thirty-three long-term employees of Tompkins County Memorial Hospital were honored by the board of trustees at dinner in Bibbins Hall on May 11, the eve of National Hospital Day
Walter N Brand, president, noted that twenty-six

of the honor guests had served the hospital faithfully from ten to twenty-three years The other seven special guests were credited with service of eight and

Brand thanked the employees for their nine years service and welcomed Mrs Ireno Oliver, who, in four months as superintendent, has "made such progress toward the kind of hospital we'd like to have for our community"

Reflecting the striking gains that have been made in the detection and treatment of tuberculosis in recent years, Frederick H Ecker, chairman of the Board, and Leroy A. Lincoln, president, of the Metropolitan Life Insurance Company, announced on May 30 that the tuberculosis sanatorium which the company has maintained at Mount McGregor since 1913 for treatment of its tuberculous employees would be closed on September 1

Although a total of 3,507 Metropolitan employees have received treatment for tuberculosis since the sanatorium was opened on November 24, 1913, it was pointed out that the number of patients and the period of treatment have been reduced to a point which no longer justifies the maintenance of an in-stitution of this size Patients now at the sanastitution of this size Patients now at the sana-torium will be given treatment at the company's expense in comparable sanatoriums located nearer to their homes

Dr Jean A Curran, president of the Long Island Hospital College of Medicine, announced on May 9 that \$103,106 has been contributed toward the collego's development fund, exceeding the \$100,000 goal which had been set \*

Four new memorial gifts, totaling \$20,600, to the Ossining Hospital building fund were announced on May 10 by Walter L Johnson, president of the hospital.

A subscription of \$17,000 from Miss Ann Edgar Donald is one of the four new subscriptions Mr and Mrs Moses Myors have given \$1,200 which will memorialize one of the x-ray rooms "in loving mem-ory of their parents"

Another \$1,200 subscription has been received from Harry Gasgall to dedicate an x-ray room, while a third \$1,200 subscription which will dedicate a waiting room has been received from Mr and Mrs Gerald Barber \*

A campaign with an immediate goal of \$5,000,000 and an eventual goal of \$15,000,000 to be used for the development of Post-Graduate Medical School and Hospital, New York City, was announced on May 9

Dr William B Talbot, superintendent of Post-Graduate, said it was planned to construct a twelvestory center to house the hospital's clinics, labora-tories, and teaching facilities Beyond this, the hospital plans three other units that will make the institution one of the best equipped in the world

A large and growing need for continued study on the part of practicing physicians at home and abroad was stressed by speakers Dr Willard C Rappleye, dean of the College of Physicians and Surgeons and director of Post-Graduate, said that "new knowledge in medicine is developing so rapidly that if the physician is to keep abreast opportunities fer continued study in his field of practice must be made available "\*

#### [Continued from page 1480]

For the second straight year, the Dobbs Ferry Hospital overcame its operating deficit through gifts, memberships, and other donations to obtain nct income of \$2,431 29 for the year 1944, according to the annual report released in May At the same time the hospital reported a cash bank balance on

December 31, 1944, of \$8,659 67

The report is also highlighted by a message from the president, V F diLustro, and statistical data revealing 11,393 "patient days," an increase of 102

Mayor F H La Guardia, of New York, putting his signature to an agreement whereby the city Drive for a new health center and hospital, declared on May 14 that he did so "to hasten all negotiations and have them so tight that no political

administration in the future will be able to duck

The agreement deeds the property bounded by the West Side Highway and 165th and 168th Streets ! Signers for the joint owners were Charles P Cooper, president of the Presbyterian Hospital, and George E Warren, in behalf of the trustees of Columbia Uni-

On the site the city will erect a three hundred-bed hospital for treatment of communicable and tropical A public-health center will include a diagnostic laboratory for the Public Health Research Institute, formed several years ago under an agreement with the city, and a public-health school to be operated in connection with the Columbia University medical school

Funds for the two buildings are incorporated in the present capital budget, which allocates \$2,690, 000 in Federal and city funds for the public-health laboratory, research and teaching center and another \$2,200,000 in anticipated Federal funds for the lios-

pital \*

# THE DOCTOR AND THE HORSELESS CARRIAGE

New laurels are added to the already notable scientific and humanitarian record of the American doctor-especially the country doctor-in a fascinating new book, "Combustion on Wheels," by David L Cohn For it seems the doctor, graduating from his horse and buggy into the horseless carriage, was among the first daring pioneers to set the automobile in a respectable niche in public opinion It was the doctors, Mr Cohn concludes, with their natural flair for science and mechanical contrivances, who not only bought and used cars but repaired them themselves in days when skilled mechanics were rarer than veterinaries. What's more, they Lept accurate records of costs and repairs which were invaluable to the automobile makers in improving their product

Mr Cohn, who will be remembered for his immortalization of the mail-order catalogue in a previous volume, "The Good Old Days," says in "Combustion on Wheels" "Doctors were the first large group to evperiment seriously with the car as a practical vchicle, keep records of its costs and performances, and on the basis of these records, decide that the car had come to stay, when all-wise bankers still held that it was only a passing fad The very fact that they approved of it, moreover, was one of the most convincing arguments that

was one of the most convincing arguments that could be made in its favor. The reasons are clear "Can you depend upon the car to get you there and back? Will it plow through mud and sand? Will it climb hills? Is it more expensive to maintain than a horse and buggy? Will it give you your money's worth? These practical questions were uppermost in the public mind in 1905 as it looked skentically at the automobile, and until they were skeptically at the automobile, and until they wero answered satisfactorily the car would remain a plaything of the rich They were first reassuringly answered by the country doctor, and his words carried weight because he was by temperament cautious, conservative, and slow to adopt new methods, while the nature of his profession required

him to put the automobile through the most rigorous tests He, more than any other man in the community, had to go out in all kinds of weather on all kinds of roads. Others could afford to be late for an appointment He could not because the issue of life or death might devalue when he approximates or life or death might devolve upon his promptness or

He offers particular credit to Dr F M Crane, who lived in Redfield, South Dakota, in 1905 Crane, disgusted with his balky car and the impotence of local mechanics, learned to "drive by ear," using his stethoscope and anatomic knowledge to diagnose the assorted gurgles, clanks, and groans of the engine

Dr Charles Sylvester, of Dorchester, Massachusetts, kept a careful record, comparing his auto costs with the upkeep of his horse and carriage He reported that after seven months the car cost him \$159.75 against \$268.10 for the horse and carriage. The automobile expense log included such items as "\$5.25 for loss of eyeglasses while raising a thirty-mile breeze in the woods" and "Repair of a bicyle which ran into me \$2.50". Dr. Sylvester also noted that "covered does which Dr Sylvester also noted that "several dogs which tried a similar blackmailing scheme were repaired by me without expense "

Dr J C Stinson, living in San Francisco about the same period, had a more discouraging experience to record He became the victim of a "cannibal mechanio" and his repair bill for a single cylinder car which had cost \$983 in the first place ran up to \$566 for three months "If these charges are not enough to make a man wild," he wrote, "I don't now what else would"

But while this sort of thing was going on, Mr Cohn records that Henry Ford and his contemporary for the state of the state raries in Detroit were almost ready to release the famous Model T. He and other present-day auto makers acknowledge their debt to the country doctor for his pioneering use of the horseless carriage Rocky Mountain M J, Feb, 1945

### PASS THE KLEENEX

The medical profession has been the goat at the tail end of a wide variety of alleged humor regarding the prevention and treatment of the "common cold". On examination of the mortality statistics from the common cold in actuarial records, we find it exactly point zero, zero, zero per one hundred thousand population, which is the same mortality rate obtained from hitting the thumb lightly with a hammer while hanging a picture (also unpreventable). The individuals who should be blamed (if there is any blame) are the ones who have the cold in the first place, because they usually wait from four days to six months from the onset of the weeping proboscis before they decide to call a doctor

Someone is always quoting figures about the number of days lost in industry due to the common cold and they expect us to believe it. A better alibit for not going to work should be thought of pretty soon as that one has long gray whiskers. A "bad cold" covers a multitude of sins, male and female, and when industry reports millions of man-hours lost due to the common cold, you can well add considerable salt and then divide by fifty and the figure

It is stated that most colds "run their course," which usually means—after the patient has exhausted all home remedies, including the numerous types of ancestral poultices and herbs, he then consults the corner druggist, who, in a period of several days, may run the gamut of pharmaceutic coryzal

therapeutics and eventually, in desperation, the

patient is advised to see a doctor

Many colds are associated with sinusitus, which is a much deeper and more stubborn infection, others are associated with bronchitis, nasal polyps, or tonsillar disease. Another item of importance is that the great increase in the number of persons who smoke has not helped to decrease the number of upper respiratory diseases, because no matter what the advertisers of certain cigarettes may say regarding the nonirritating effect of smoking, it has considerable to do with the onset and course of upper respiratory diseases.

Contrary to the general opinion, most "colds" are not acquired by direct contact, but are the result of exposure of certain susceptible parts of the body to drafts, low temperatures, and moisture with resultant vasoconstriction of the nasopharynx. This in turn causes lowered local resistance of the mucous membrane surfaces followed by the classical symptoms of the common cold and the drippy schnozzola. Perhaps the future will produce a vaccine from a draft of air so that one may begin by injecting one tenth of a cc and gradually work up to a full zephyr. This resembles somewhat the more recent attempt to treat arthritis with bee venom by beginning with one tenth of a sting and gradually working up to a full sting. The patient may get stung, however, in both instances—J. J. L., Detroit Medical News, Feb. 5, 1945

### NEW AND RAPID LABORATORY TEST FOR SMALLPOX

Major van Rooyen and Major Illingworth,1 of the oyal Army Medical Corps, have recently con ibuted what appears to be a most valuable laborary test for smallpox. According to them, a smear eparation from a suspected case of smallpox can made, stained, and examined and the report inded to the physician in half in hour. The atenal is obtained by delicately scraping either the use of a vericle or, still botter an early papule with-it drawing blood. This is rubbed onto a specially oppared silde staned according to the Paschen sthod (which is described in detail) and examined ider the microscope. If the material was secured on a case of smallpox the trained eye quickly deets masses of characteristic elementary bodies. et only are these infinitely more numerous than e elementary bodies found in chickenpox\* but ey are about twice as large. The authors warn at this method applies only to the identification smallpox bodies and is not applicable to those of ickenpox since the latter are too scanty

The test was postive in 77 cases of smallpox and gative in only 3. In no case did a positive test sagree with the clinical diagnosis. The test oved particularly valuable in the early diagnosis cases of modified smallpox, in which only a few erete lesions, suggestive of chickenpox, were sent and also in the early stages of the severe ms of hemorrhagic smallpox in which the papular ge suggested typhus fever or measles. Indeed, in a latter type of case the earliest buccal lesions often embled Koplik spots. The importance of this t can best be appreciated by realizing that the ul test, in which infective material is scratched o a rabbit's cornea, can only be completed in three rs and that the same applies to the chick chorioallontoic membrane test whereas the flocculation test is not reliable until after the first week of the disease.

In another contribution Major Illingworth and Major Oliver's report their observations on an epi demie of smallpox in Egypt during 1943 and 1944 These authors emphasize that the early clinical differentiation of smallpox and chickenpox was often impossible. Not only was the typical distri-bution of the lexions ("centrifugal" and 'centripetal," respectively) a mare and a delumon, but they also found that smallpox lesions came out in crops over a period of four or five days, a characteristic usually ascribed to the lesions of chickenpox, and that maturation of the lesions was sometimes quite as rapid in smallpox as in chickenpox. They noted oval lesions in the folds of the skin and petechine in the axillas in cases of the hemorrhagio type. Even the characteristic backache of the prodromal stage of smallpox was by no means a prominent symptom Finally 96 of the 100 patients in the series had been previously vaccinated 70 having been vaccinated "successfully" within two years

All this goes to show that there are exceptions to overy point of differentiation between smallpox and chickenpox, as was brought out in a recent progress review in the Journal. Smallpox varies in charactor and severity in different localities. Under war-time conditions as they exist today in Egypt with the influx of troops from so many parts of the world this disease in almost every hue of human skin pre-sents extraordinary difficulties. Faced with these, the authors found that examination of the scrapings from papules or vesicles for elementary bodies was of the greatest assistance in making an early diagnosls. # SUPER-SEAL VITAMINS

Super-Seal Vitamins are not ordinary pellets, but a definite advance in tablet engineering. The construction is unique with respect to the architectural segregation of the water soluble from the fat soluble vitamins. An inner, enteric type sugar coating makes each vitamin available in its respective medium, i.e., the fat solubles in the alkaline medium of the intestines and the water solubles in the acid medium of the stomach.

# SUPER-SEAL "C"

(WITH A AND B1)

The employment of vitamin C in allergies is recommended by various investigators, though scientific opinion differs regarding its definite effects.

In the efficient management of Hay Fever, Rose Fever, Eczema, Contact Dermatitis, a co-existing condition may call for therapeutic doses of vitamin C.

"Super-Seal "C" with A and B<sub>1</sub>" provides vitamin C in high potency — assuring adequate strength for clinical control of conditions arising from a deficiency of this vitamin. Each pellet contains: 125 mgm. vitamin C; 1.5 mgm. vitamin B<sub>1</sub>; 2500 USP units vitamin A.

Suggested Dosage — Initially, 4 to 8 pellets per day, gradually reduced after ten days to a maintenance dose of 2 per day. In bottles of 40's and 100's at prescription pharmacies.

Other Super-Seal Vitamins
Super-Seal "VITALERT"
and Super-Seal VITAMIN D

# DIURBITAL

DESCENT IN BLOOD PRESSURE is smooth, substantial sustained, parallels nutritional stimulation of cardiac muscle and vasorelaxation. Divides relieves heart of fluid load. Sedation promptly allays dizzness, head ache, anxiety

PRESCRIBE DIURBITAL\* in Hypertension, Angine Pectoris, Coronary Thrombosis, Myocarditis

\* Trademark Reg. U S. Pat. Off.

DIURBITAL Tablets each contain Theobromine Sodium Salicylate, 3 grs., Phenobarbital, ½ gr, Calcium Lactate, 1½ grs. Bottles of 25 and 100 tablets

SAMPLES AND LITERATURE ON REQUEST

## Charactoristics of Infantile Eczema . . .

INTERNAL: Low blood concentration of unsaturated fatty acids,

Nutrational infantile exerna usually responds well to treatment with fats rich in the essential fatty acids. In such cases Soyola\* is the medication of choice

Soyola is a palatable combination of essential unsaturated fatty acids from soybean oil the water-soluble constituents of rice bran, and naturally occurring antioxidants.

Each 100 Gm. of Soyola contains 65 Gm soybean oil and 5 Gm rice bran concentrate

NUTRITIONAL THERAPY IN INFANTILE ECZEMA

Supplied in battles of 16 fluidounces

# For the infant deprived of mother's milk

# SIMILAC

### SIMILAR TO HUMAN MILK

A powdered, modified milk product especially prepared for infant feeding, made from tuberculin tested cow's milk (casein modified) from which part of the butterfat is removed and to which has been added lactose, olive oil, coconut oil, corn oil, and fish liver oil concentrate

Similar provides breast milk proportions of fat, protein, carbohydrate and minerals, in forms that are physically and metabolically suited to the infant's requirements. Similar dependably nourishes—from birth until weaning.

One level tablespoon of Similac powder added to two ounces of water makes two fluid ounces of Similac. This is the normal mixture and the caloric value is approximately 20 calories per fluid ounce.

## A SPENCER

Will Give Safe, Comfortable Support

Non-elastic Will not yield under strain No leather metal or hard pads

The reason why Spencer Supports are so effective is this Each Spencer Support is individually designed at our New Haven Plant after a description of the patient's body and posture has been recorded—and 15 or more

measurements have been taken This assures the doctor that each patient will receive the proper design to aid his treat ment, that the support will improve hody mechanics and will fit with the precision and comfort necessary. Yet a Spencer costs little or no more than an ordinary support.

At lefts

Speccer Abdominal Supporting Belts de signed especially for man and woman pictured. Non-elastic, Instanty adjusted. Can not yield or slip. The weight of support is placed on the pelvic girdle, not on spine at or show's lumbar region.

After Herniotomy

As a protection for the weakened abdominal wall, especially when patient is forced to return to work sooner than the doc tor desires, a Spencer is helpful Each Spencer is so designed as in permit excercise of abdominal muscles while providing adequate back and abdominal support

For further information, lonk in telephone hook under Spencer cursettere or write direct to us

NEW! High potency
B complex
BEPADIN CAPSULES
with Vitamin C!

LOOK FOR THIS NEW

2-COLOR CAPSULE!

A LITTLE OVER A YEAR AGO
Bepadin Capsules I. V. C. were introduced. That they represented a real improvement in high potency Vitamin B complex therapy is proven by the alacrity with which the medical profession has prescribed them!

NOW, VITAMIN C HAS BEEN ADDED—75 mg. per Bepadin capsule plus higher quantities of the B complex factors!

Bepadin Capsules with C,

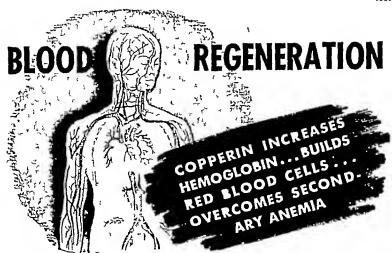

I. V. C. contain two of the
most important sources of the
complete natural Vitamin B
complex, contained in liver
concentrate and yeast. In
addition each capsule contains Vitamin B<sub>1</sub> (2 mg. Thiamine HCL); Vitamin B<sub>2</sub> (G) (3 mg.
Riboflavin); PP (20 mg. Niacin
Amide), Vitamin B<sub>6</sub> (0.333 mg.
Pyridoxine HCL); FF (0.250
mg. Pantothenic Acid)

# Bepadin Capsules

WITH VITAMIN

INTERNATIONAL VITAMIN CORPORATION

Before Copperin appeared, massive iron doses were inflicted on the anemic Most of the iron was not utilized. The excess, excreted fecally, produced gastrointestinal irritation and upset—thus defeating the original purpose of the clinician.

Copperin represents a scientific conception of iron needs in secondary anemia The iron content per capsule is small — 32 mgm — but wholly adequate The potent catalytic agent, copper sulphate, makes ALL the iron

available for regenerative processes

There is rapid replacement of hemoglobin and new red cells This is markedly manifested in treating the hypochromic anemia of children, the "milk anemia" of infants, hemorrhagic anemia following blood donation, pregnancy anemia, chlorosis and anemia of middle aged women

In two strengths Copperin
"A" for adults, Copperin "B" for
children

KINDEGGOS

WATER-SOLUBLE

Before the advent of the lens it was impossible to get perfect camera focus. The reflected light was dispersed over the negative—the image was neither clear nor sharp

Since the advent of pure bile acids with predictable actions you can focus your bile therapy It's no longer necessary to prescribe bile preparations valueless in excess factors

In Doxychol-Breon, the marked hydrocholeretic agent, dehydrocholic acid is combined with
desoxycholic acid to provide thin bile stimulation
Dehydrocholic acid more than doubles the volume
of fluid bile from the liver Desoxycholic acid chiefly
assists in the emulsification of fats and the absorption
of fat-soluble vitamins by the small intestine

These two salient bile acids now available in one convenient tablet form, Doxychol-Breon, are supplied in bottles of 100, 500, and 1,000 tablets

Doxychol Tablets are composed of dehydrocholic acid 3 grains and desoxycholic acid 1 grain

### TO LEND

# Satiety Value

### TO SUMMER MEALS

MOST home makers today recognize the wisdom of summer time meals that are "lighter," foods that lessen met abolic burdens during hot weather As desirable as such dictary adjustment may be, it presents one undesirable feature it lessens the satiety value of summer time meals

Scrving candy for dessert, frequently solves this problem. The satiety value of candy is notably high. Yet two or three pieces of candy represent much less in calories than the customary American desserts, such as pies or puddings.

The candies which lend themselves especially well to this purpose are those in the manufacture of which butter, eggs, milk, cream, fruits, and nuts are used Such candies, in addition to their satiety value, contribute to the satisfaction of many nutritional requirements, since they provide small amounts of biologically adequate protein, fats high in unsaturated fatty acids, minerals, and vitamins

### THE NUTRITIONAL PLATFORM OF CANDY

- 1 Candies in general supply high calorie value in small bulk,
- 2 Sugar supplied by candy requires little digestive effort to yield available energy
- 3 Those candies, in the manufactors of which milk butter oggs, fruits, nuts or posinits are used, to this extent also—
  - a) provide biologically adequate proteion and fats rich in the unsaturated fatty acids;
  - b) present approceable amounts of the im portant minerals calcium, phosphorus, and iron;
  - c) contribute the niacin and the small amounts of thismine and riboflavin contained in these ingredients.
- 4 Candies are of high satisty value eaten after meals, they contribute to the sense of satisfaction and well-being a meal should bring eaten in moderation between meals, they stave off hunger
- 5 Candy is more than a mere source of nutri ment—it is a morala builder a contribution to the joy of living.
- 6 Candy is unique among all foods in that it shows relatively less tendency to undergo spollage, chemical or bacterial.

# TEAMWORK IN SCIENCE CREATES

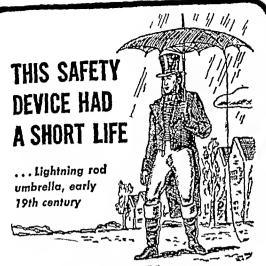

# CHEPLIN PENICULINI

We take pride in the new \$3,000,000 Cheplin Penicillin laboratories, but we take even greater pride in our staff of scientists who manage and operate them

Less than two years ago there was a cornfield where these laboratories now stand A group of hand picked scientists composed of bacteriologists, pharmacologists, medical men, toxicologists, chemists and chemical engineers, working as a team have created Cheplin Penicillin

To our staff goes full credit for making Cheplin one of the largest producers of penicillin in the world. When you need penicillin — specify Cheplin, the achievement of teamwork in science.

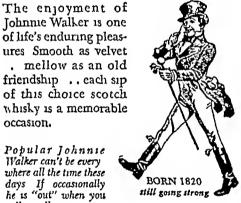

# But JOHNNIE WALKER is more popular than ever

Johnnie Walker is one of life's enduring pleasures Smooth as velvet . mellow as an old friendship .. each sip of this choice scotch

Popular Johnnie Walker can't be every where all the time these days If occasionally he is "out" when you call call again

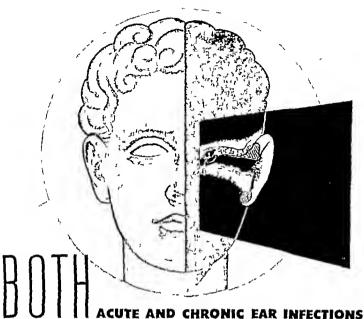

occasion.

## RESPOND TO TOPICAL CHEMOTHERAPY WITH

## White's OTOMIDE

a stable solution of carbamide (uren) 10% with suifanitomide 5% in glycerin of unusually high hygroscopic activity Anhydrous chlorobutonol 3%—a local anesthetic that is therapeutically compatible with suifanamides—is included for its analgesic and antipruritic properties

## Therapeutic Advantages of Carbamide as Component of Otamide

- Chemically debrides lesion by solvent effect on necrotic tissues
- Renders sulfanilamide effectively ontibacterial even in the presence of pus

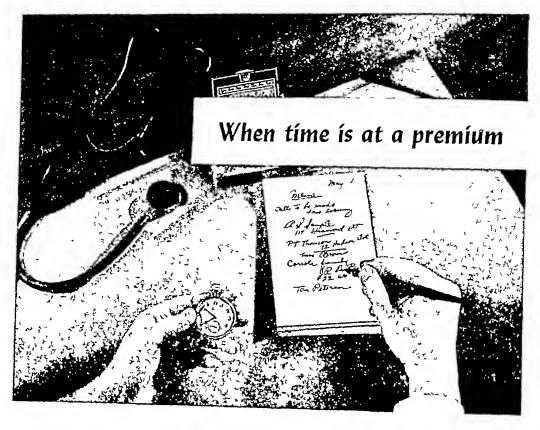

- 3 Solubilizes sulfonliamide, effecting higher tissuo concentration and increasing diffusibility through living and dead tissues
- 1 Non-irritating

#### indications

Local management of suppurative and non-suppurative otitis media, and of sulfonamide-susceptible infections of external auditory canal

White's Otomide is ovaliable in dropper bottles of one-half fluid-ounce (15 cc)—on prescription only

# **PYRIDIUM**

REG U S PAT OFF

# affords several distinct advantages

## EASE AND CONVENIENCE OF ADMINISTRATION

Pyridium is convenient to administer No laboratory control, accessory medication, or other special measures are necessary for effective Pyridium therapy

### LACK OF TOXICITY

Therapeutic doses of Pyridium may be administered with complete safety throughout the course of cystitis, pyelonephritis, prostatitis and utethritis

### RAPID RESPONSE

Prompt, gratifying relief of distressing urinary symp, toms is the characteristic response to Pyridium, therapy

More than a decade of service in urogenital infections

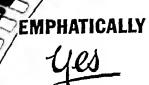

# PYRIDIUM

Pyridium is the United States Registered Trade-Mark of the Product Monufactured by the Pyridium Corporation

MERCK & CO, Inc Manufacturing Chemists RAHWAY, N J.

LABORATORY and clinical tests under com petent direction have shown TAMPAX to possess a wide margin of safety in providing for intravaginal absorption of the flux. With the average monthly less approximating a total of 50 cc., even Junior TAMPAX, with its absorptive capacity of 20 cc. per tampon, assures adequate protection for many women during the entire period. Regular TAMPAX has a capacity of 30 cc., and Super TAMPAX will easily absorb 45 cc., per tampon.

One investigator, employing TAMPAX for cata menial protection in "twenty five women under close institutional observation" concluded that with a tampon of proper size, absolute comfort and complete control of the flow can be obtained the obvious advantage of the small, medium and large sized tampon of the particular brand (Tampax) is to be noted "Other clinical studies." have demonstrated that in well over 90% of the subjects, TAMPAX affords complete protection with satisfaction, through out menstruation.

The coupon below is for your convenience.

# When Cushioning of the Impact is Needed

In the alleviation of burdensome menopausal symptoms, the natural estrogenic substances have established a notable superiority over the years. Undesirable sideactions such as nausea, vomiting, headache and dizziness, reported in many instances to attend the use of synthetic estrogens, are uncommon when natural estrogens are used.

SEMESTRIN, derived from pregnant mare's urine, contains all the natural estrogenic substances, estradiol as well as estrone SEMESTRIN proves as economical as it is effective in the menopausal syndrome, kraurosis vulvae, pruritus vulvae, frigidity, infantilism, and for the suppression of lactation

Semestrin, 1 cc ampuls, is available in the following potencies 2,000, 5,000, 10,000, and 50,000 International Units, 2,000 and 10,000 International Units per cc in 30 cc. vials, and 10,000 International Units per cc. in 10 cc vials.

THE S. E. MASSENGILL COMPANY

The active ingredient of Koromex Jelly is phenylmercuric acetate, whose remarkable contraceptive efficiency was affirmed in the illuminating report by Eastman and Scott (Human Fertility 9 33 June 1944) Their clinical and experimental data confirmed the earlier findings of Baker, Ranson and Tynen (Lancet 2 882 October 15, 1938) In addition to its excellent spermicidal efficacy, Koromex Jelly possesses to a high degree those other qualities which are physiologically and aesthetically so important to patients For these reasons you can prescribe Koromex Jelly with confidence

# Specific Action

### TO PROMOTE FAT DIGESTION

When fat digestion is impaired due to deficient bile secretion, and when fatty foods prove intolerable in the absence of gallbladder involvement, Degalol—the original, chemically pure deoxycholic acid—offers noteworthy advantages.

A constituent of human bile, it is the fraction chiefly concerned with fat emulsification, promoting the digestion and absorption of ingested food fats and the utilization of the fat-soluble vitamins

In the dosage required, Degalol exerts little or no choleretic influence. Thus it proves superior to ordinary bile salts which not only are less potent in their influence on fat emulsification, but—since they are required in higher dosage—produce side actions which are frequently undesirable. The powerful choleretic influence of the bile salts, for instance, is definitely to be avoided in catarrhal jaundice, though fat digestion and vitamin absorption are to be enhanced

#### DUSAGE

One or two 1½ gr tablets t i d. Supplied in boxes of 100 sanitaped 1½ gr tablets. Available on prescription thru sli pharmacies When fatty foods lead to postprandial distress and epigastric pain, Degalol frequently proves specific. In auspected or frank deficiency of fat-soluble vitamins D, E and K and carotene, the administration of Degalol together with the vitamins is indicated

MUCHOSE is a hydrophilic regentile colloid composed of the highly purified bemiceiluluse of Plantago locilingil.

LUBRICATING BULK is provided by the absorption of approximately 50 parts of water to produce a colloidal gel.

BLAND hypoallergenic, and free from irritants, it is also non-digestible, non absorbable, and chemically inert in the digestive tract.

INDICATED in the treatment of both spatic and stoole constipation and as an adjunct to dietary measures for the control of constipation in aged, convelescent and pregnant patients.

DOSAGE: 1 or 2 cuspoonfuls in a glass of water milk, or fruit puice once or twice daily followed immediately by another glass of fuguld. It may also be placed on the tongue and washed down, or it may be esten with other foods. Ample fluid intake is advisable to sessure maximum bulk formation.

WHEN digestive symptoms and general malaise are accompanied by marked downward displacement

of the viscera, they are often relieved by ANATOMICAL SUPPORT.

X Ray of patient with visceroptosis (Left) The lesser curvature of the stomach is below the crests of the ilia (Right) X Ray of same patient after application of Camp Support for visceroptosis indicating how the viscera is held in a more nearly normal position.

## Visceroptosis Support - CAMP

The roentgenologist may or may not find disturbed conditions in the duodenum . the displaced viscera

being the only finding For these patients, many physicians prescribe adequate rest, proper food at regular intervals, graduated exercises (especially for the patient with "visceroptotic habitus"), and a scientifically designed anatomical support. Numer-

Camp supports for visceroptosis are fitted and adjusted with the patient in the partial Trendelenburg position Pads are frequently used under the direction of the physician

ous reports show that this treatment results in the gradual disappearance of the digestive symptoms

> with improvement in general health and weight gains for the thin patient. In time the support may be discarded

Camp Supports are also of assistance for postural defects that so frequently accompany the visceroptotic condition

S H CAMP & COMPANY . Jackson, Mich . World's Largest Manufacturers of Scientific Supports Offices in New York • Chicago • Windsor, Ontario • London, England

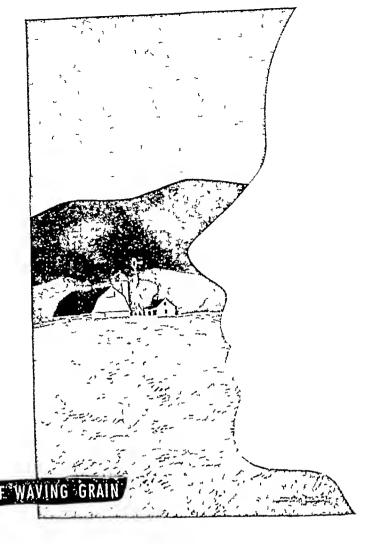

- gastro-intestinal spasm without unpleasant side effects.
- 2. Its phenobarbital (1/s gr ) aids in providing central sedation, thus helping to control the psychogenic factor
- 3. And its alukalin (5 gr) is a potent antacid and adsor bent, which tends to reduce irritability and add bulk.

Indications include pylorospasm-cardiospasm-unstable colon-biliary dyskinesis-biliary colic-and as an adjuvant to the dietary and medical management of peptic ulcer, intestinal flatulence and gastro-enteritis.

Suggested desage 1 or 2 tablets before meals.

Supplied in bottles of 100 tablets each.

The Malthic Chemical Company · Newark, New Jersey

Ephedrine preparations are particularly suitable for topical application in the nose to relieve congestion, to maintain the patency of sinus openings, and to facilitate breathing Ciliary activity, with its rhythmic motion like that seen in a field of waving grain, is not impaired by the use of Ephedrine, nor does the drug interfere otherwise with local tissue response to infection Numerous Ephedrine products by Lilly are available, including inhalants and aqueous dilutions

#### Information for Medical Officers

With the termination of the war in Europe, many medical officers in that theater are in doubt as to their future assignments. Many physicians have apparently written to the A.M.A. under the impression that that organization could do something about it. The Journal says

"The American Medical Association—and this statement is made wholly in explanation of a fact that should be obvious to everyone-does not have authority to determine in any way the assignments of physicians in the armed forces The officers of the Association would be heatant to interfere in the making of decisions as to the assignments or transfer of men in the armed forces. The decisions as to how military personnel are to be utilized must rest with those who carry the responsibility for the ultimate results This statement is made because many a medical officer has written to the headquarters of the American Medical Association actually demanding that the Association exert its influence to determine the decisions, not only of those responsible for the medical departments of the armed forces, but even of the Secretaries of War and Navy, of the Committees on Military Affairs of the legislative bodies, and even of the President. The Board of Trustees and the Officers of the Association have felt keenly, nevertheless, the responsibility that rests on them to present to those in authority the facts that should be given serious consideration in the making of decisions concerning medical personnel."

Some physicians have also written to the A.M.A protesting against the possibility that they may be assigned on their release from service with the armed forces to the Veterans Administration On their behalf, the A.M.A. Committee on Postwar Medical Service on May 12 took prompt action and sent to the Secretary of War, the Secretary of the Navy, and the Committees on Military Affairs of the House of Representatives and the Senate the following

"In November, 1944, the Army Medical Department was directed to transfer at least three hundred medical corps officers to the Veterans Administration, this number to include those officers in the sone of the interior who were formerly employed by the Veterans Administration as civilians Apparently about one hundred men

meeting the latter classification were so assigned and in addition some two hundred others selected largely from among men who had been marked 'limited service' Many of those thus assigned have protested and others are now protesting bitterly against these assignments on the ground that their enlistment was distinctly for military service and that assignment to the Veterans Administration cannot be thus characterized Many physicians who have served with distinction in both the European and the Pacific theaters of operation are now indicating by communications addressed to the headquarters of the American Medical Association the fear that they may be assigned on their return to the United States to service with the Veterans Administration unwillingness to serve with the Veterans Administration is based not only on their belief that this cannot be considered military service but also on the point of view that competent, scientific medical care is difficult under the conditions that prevail in the veterans' hospitals

The Committee on Postwar Medical Service, which includes representatives of the American Medical Association, the American College of Surgeons, the American College of Physicians, the American Hospital Association, the Federation of State Medical Licensing Boards, the Association of American Medical Colleges, the Catholic Hospital Association, the Advisory Board for Medical Specialties, and many other groups, after careful consideration of the problems involved, urges that the Secretary of War, the Secretary of the Navy, and all others concerned with the activities of physicians voluntarily enlisted in the armed forces recognize the righteous-

ness of the protests made by these medical officers against assignment to the Veterans Administration. It is further urged that the needs of the Veterans Administration for physicians be met either by voluntary enrollment of men in the armed forces at the time of their release from the service or by recruitment of medical personnel from civilian sources."

It is quite understandable that many physicians, under the circumstances, would be unwilling to serve in the Veterans Administration not because they are reluctant to care for the veteran but because, as stated, and as seems to be borne out by recent allegations from many sources, "competent, scientific medical care is difficult under the conditions that prevail in the veterans' hospitals"

Surgeon General Kirk, in a telegram to the A M A, has stated

"The policy of the War Department and of my office is that when medical officers are returned to the United States on rotation or redeployment they will be assigned to duty according to their specialties. They will replace officers with similar qualifications who have not had opportunity for foreign service."

This information should answer some of the questions being asked by medical officers Reassignment and redeployment is a function of the office of the Surgeon General

#### Oral Moniliasis

Tracer chemicals have been of invaluable assistance in the clarification of metabolic and chemical processes. Certain microorganisms play an analogous role in the elucidation of the evolution of infection from its very source. Monilia albicans, the cause of thrush, is such an organism by virtue of its easy clinical recognition and the facile laboratory confirmation of its presence. Valuable epidemiologic data have recently been collected by tracing the spread of this infection by appropriate mycologic methods <sup>1</sup>

Oral swabs were obtained from apparently normal newborn infants at six different in-

tervals after birth to determine the frequency of monilia in the preclinical stage Vaginal swabs were taken to ascertain the relationship between maternal and infantile infections The possible role of air-borne infections was investigated, and at opportune times a culture study was made of the nursery personnel in a search for possible carriers Since the fungus is not a normal inhabitant of the skin, though saprophytic in the intestine, these tracts were not stud-1ed 2 Nipples, used by infants infected with thrush, and other pertinent objects in the nursery were studied for contamination Effective sterilization processes were also in-

<sup>&</sup>lt;sup>1</sup> Vol 128, No 3, May 19, 1945, p 206

vestigated Some infants, previously infeeted, were followed with periodic culture studies for months after discharge from the

hospital

M albicans was found in 20 out of 107 infants, 18 7 per cent, a figure in agreement with previous work on this subject? These infants were breast fed, 15 completely, 5 partially In every instance in which tho fungus was demonstrated, clinical oral thrush developed in two to ninc days addition to this group, 34 other infants developed clinical thrush The causative organism was demonstrated in all these infants, perfect laboratory confirmation of the diagnosis

The occurrence of oral thrush in 6 out of 13 infants whose mothers had vaginal flora containing M albicans is significant fants of mothers with vaginal moniliasis develop thrush about three days after birth Infants with thrush whose mothers were free of the fungus manifest the infection about a week after hirth Cultures of the nursery personnel were persistently negative for the monilis, as were cultures of the air taken at strategic points. Nipples and bottles used by infected infants as well as solutions in which these nipples were immersed, showed uniformly positive cultures Surfaces and materials touched by these contaminations similarly yielded positive cultures

The follow-up studies revealed that not

infrequently asymptomatic infants continued to harbor the fungus This organism may persist as long as twelve weeks after the clinical phase has disappeared. It is small wonder, then, that contact with these infants is very likely to cause secondary

Such infections appear at a longer interval after birth than the primary infec-

tion, the mark of differentiation

If a parturent mother harbors an infection or an infectious organism isolation from the baby is obligatory The spread of moniliasis is proof positive of the validity of this practice, for the mother centaminates whatever she touches-herself, the bed linen, and various articles. The infected infant must be removed from the nursery. the procedure to institute in all infections. lest n rapid spread ensuo. The importance of clean nipples, tables, and other sources of contact is obvious Solutions for immeraing nipples should be prohibited, so prone are they to contamination Monibasis belongs to a unique group of epidemic contagions in which the air-borne factor and personnel infection play little or no role in the spread

#### Current Editorial Comment

#### Infant Deaths from Mechanical Suffocation

An interesting and valuable report has been circularized by the Committee on Public Health Relations of the New York Academy of Medicine dealing with this important subject, for it is found that deaths from mechanical suffocation have increased by almost 60 per cent in the past They accounted for over 1,500 deaths in the United States in 1942 discussion of "Accidental Mechanical Suffocation" (Journal of Pediatrics 5 404-13, Nov , 1944) Dr Harold Abramson has shown that about 80 per cent of these deaths in New York City for the five-year period, January, 1939, to December, 1943, occurred

in children of less than one year of age, and 85 per cent of those during the first year of life have been in children less than 6 months old The same is true of deaths reported from upper New York State (Health News 22 1, Feb 26, 1945) To prevent these unnecessary deaths, five suggestions have been offered for mothers to follow, as announced by the Committee

The first suggestion is never have loose materials, such as pillows, blankets, and outer covering in the baby's crib or carriage mfant should sleep on n firm mattress rubber sheets and undersheets should be sprend smoothly and should be large enough to tuck tightly under the mattress—quilted pads should be tied down. Any top covers should be large enough to tuck firmly under the sides and lower end of the mattress. Loose objects such as pillows, loose blankets, and restraining straps are unnecessary and wholly undesirable.

The second suggestion, especially for babies under 6 months of age, is—watch the baby's position in his crib or carriage. Observe him at frequent intervals when he hes "face down". The prone posture was noticed in 68 per cent of the babies in the New York City study who were found after accidental death, and many of these were discovered with soft pillows, mattresses, or mattress coverings occluding their noses or mouths. Only 17 per cent of the suffocated babies were found lying "face up", these also had pillows or blankets covering the face.

Since the peak of infant deaths from mechanical suffocation is reached during the late fall and early winter months, the third suggestion is—let the baby wear enough clothes to maintain normal body temperature but allow him unhampered movement at all times. Sleeping-bag garments with mechanical closing and locking devices which may catch beneath the infant's neck, as well as tight caps and bibs, should be avoided

A fourth suggestion is—always sit up and hold the baby while feeding him. This suggestion holds especially for the early morning feedings. If the mother, at the time for the 3 00 Am or 6 00 Am feeding takes the baby to her bed while she feeds him from the breast or from the bottle she may fall asleep with the disastrous result that baby smothers from having the mother's breast or other parts of her body occlude breathing. The parent's bed—next to the crib and carriage—has become the fourth most frequent site of infant death from mechanical suffocation.

The fact that death takes place most often between 3 00 am to 6 00 am and 6.00 am to 9 00 am also leads to the fifth suggestion—do not leave baby unguarded during or too soon after feeding. Although most mothers "bubble" their babies during and after feeding, the early morning hours are not conducive to the patience which the job requires. Many mothers who have artificially fed children just prop the bottle into baby's mouth and leave baby while he feeds. In such situations there is the danger of suffocating from regurgitated food.

These five simple rules are easy to follow and observe and should be made generally known

DD.T Discussing the medical and public health importance of DDT in the 1945 Hermann M Biggs Memorial Lecture at the New York Academy of Medicine, April 5,

"Dr Fred C Bishopp told of the discovery of D.D T and summarized current knowledge of its uses in war and in peace

Dr Bishopp said that insects and related arthropods assume a high rank in importance in the health and prosperity of nations in both peace He cited, as exclusively insect-borne, some of the world's most dreaded diseases, such as plague, epidemic typhus, and African sleeping sickness He mentioned also Rocky Mountain spotted fever, endemic typhus, scrub typhus, encephalomyelitis, yellow fever, and many other illnesses for which insects, mites, and ticks are wholly responsible Insects that carry or produce plant diseases, that destroy vegetables or fruits, cereals or sugar cane, or that damage livestock or food products in storage often are a dominant factor in decreasing food supplies so that low-income groups or even entire populations suffer from malnutration and many people The devastation of forests die of starvation and grasslands by insects, which increases the cost of suitable shelters and induces destructive soil erosion, floods, and forest fires, also affects human welfare All insects are not arch enemies of man, Dr Bishopp pointed out Thousands of species may be classed as neutral and other thousands as beneficial

Dr Bishopp prophesied numerous peacetime developments, including farms with contented livestock and cleaner dairy products as results of the use of this insecticide in combating horn flies, stable flies, and houseflies, also outdoor areas with fewer punkies, black flies, and mosquitoes. Insect destroyers of crops may be held in stricter control thus helping to assure ample and economic food production which, in turn, means better general health and happiness.

Dr Bishopp said that DDT appeared destined to assume an important role in controlling sand flies and thus in the reduction of the incidence of kala-azar and sand-fly fever. Tick control also will probably be accelerated materially by the use of DDT"

He pointed out also that careful control of its use should be exercised in order that beneficial insect life should be preserved

## A COMPARATIVE STUDY OF 800 TEMPERATE AND INTEMPERATE INMATES OF A PENAL INSTITUTION

PAUL WENGER, M D, Rochester, New York

(Formerly Senior Clinical Psychiatrist, Clinton Prison, New York)

IN A PREVIOUS study of four hundred alco-L holics in a state prison,\* it was pointed out hy the author that enforced abstinence from alcohol epparentiy had a wholesome effect on convicts who, prior to their incarceration, had succumbed readily to a dangerous dranking habit It was furthermore explained that such an abstinence has been a prerequiate for any other successful treatment, be it medical, mental, or spiritual It was also stated that the prognosis of these excessive drinkers could be considered favorable, if, in a scientifically planned way, one replaces the mental crutch, manifesting steelf in their habitual drinking, with an equivalent of social and emotional maturity. Thus, a major achievement will have been accomplished toward crime prevention in inebriates. Simultaneously, the role of the personality as the decisive fector in the development of a social failure, characterized by alcoholism and criminal behavior, was illustrated

In order to illuminate more exactly the relationship between inciriety and crime, this additional study was undertaken, its purpose is to depict the difference between temperate and intemperate offenders, thus determining more accurately the role of alcohol used excessively as a promoter of peculiar antisocial behavior

This survey was compiled in a manner similar to the former study-from official reports as well as personal observations and interviews with inmates of Cimton State Prison, New York, terminating in the summer of 1944. At that time there was a total of four hundred temperate convicts confined in the institution, which figure constituted approximately 23 per cent of the total population of one thousand, seven hundred inmates A year ago, according to the previous study, the number of temperates was 34 per cent of the total prison population (11 per cent greater than during 1944) Apparently, a shift has been taking place from the "dry" to the "wet" side among the men admitted to this prison, it may be due to war conditions with a trend for "fast living," increasing the cases of elcoholic offenders, and also to some degree to the fact that a number of foremost temperate inmates have been recruited by enlistment with the armed forces since 1943

If we compare the four hundred temperates

examined in 1944, with the four hundred intemperates examined in 1943, several interesting facts can be elicited with respect to their background, development, and personality, facts which add much-needed knowledge to the problem of alcoholism and criminal behavior

The following tables show the corresponding percentile figures of temperate and intemperate inmates, scrutnized in accordance with the nbove-mentioned outline. (T denotes temperate, Int. denotes intemperate.)

#### Social Background

The first table shows the marital status of our men

Evidently the greatest difference between temperates and intemperates exists among the separated and divorced convicts. We note a 16 per cent increase of drinkers in this group table also confirms the previously found fact that marriage favors temperance. We find a 14 per cent increase of temperates among the married men. Surprisingly, the single convicts are the strongest group among the drinkers as well as the abstainers, however, the figure of 60 per cent of ebstainers cannot be taken at its face value, but should be calculated below the corresponding figure of the drinkers, considering the fact that the greater part of the 60 per cent temperates belonged to the very young age group of the early twenties, an age when marriage usually is not yet contemplated earnestly, whereas, of the 48 per cent alcoholics of the single group. only a very small number was found to be under the age of 25

The next table covers the occupation of our inmates

This table indicates mainly that unskilled laborers tend more to drinking than skilled ones it also confirms the fact that laborers outnumber by far the cierical and professional groups among the convicts, proving that crime and lack of education (not lack of intelligence) go hand in hand

<sup>\*</sup> Wenger Psul. New York Stata J Med. 44: 1898 Sept. 1) 1944.

TABLE 2

Commoo laborers Skilled laborers	400 T 34% 51%	400 Int 44% 41%
Occupations, such as waiters,	1%	6%
Professional and independent businessmen Clerical workers	8% 6%	6% 3%

#### Physical Development

The first table in this group depicts the physical (medical) classification of the eight hundred inmates

TABLE 3

	400 T	400 Int
Class I (best condition)	27%	17%
Class II	58%	68%
Class III	7%	10%
Class IV (worst condition)	8%	370

Remarkable is the 10 per cent increase of abstainers among the physically fittest men. As to the second group (Class II) we perceive a 10 per cent increase of intemperates, apparently minor physical defects may cause feelings of inferiority which are compensated by indulging in intoxicants

The next table denotes the health status of the men concerning the history of their social diseases

TABLE 4

	400 T	400 Int
History of venereal infections No history of venereal infections	$\frac{28\%}{72\%}$	40% 60%
No history of veherest imegations	1270	00%

Here we see clearly the correlation of venereal diseases with a corresponding drinking habit Twelve per cent more intemperates than temperates give a history of venereal infections, which supports the known fact that alcohol dulls the inhibitions that control sex conduct

#### Mental Development

All eight hundred men were tested psychometrically in order to ascertain their intelligence quotient (I Q)

TABLE 5

	400 T	400 Int.
Feebleminded	2%	1%
Borderline Dull	17%	12%
Average	45%	$^{29}\%$
Superior	13%	13%

The difference between abstainers and drinkers is amazingly small, it confirms the statement made in the previous study that excessive drinking seems to have no major effect on a man's in-

This does not necessarily tellectual capacities refute the conclusions reached by some biologists, who found that the progeny of alcoholics deteriorated intellectually, however, the available statistics differ to a major degree in this Only in the terminal stage of chronic alcoholism does the intellectual deterioration reach a striking point Contrary to it, moral deterioration sets in relatively early in drinkers, which fact, in the experience of this author, has been responsible for a considerable part of all prison commitments Statistical figures collected recently in this institution show that exactly one third of our inmate population committed a felony in a state of alcoholic intorica-

As to the psychiatric classification of our cases, the following table could be compiled

TABLE 6

	400 T	400 Int
Psychopathic	54%	41%
Alcoholic	0%	29%
Approximately normal	31%	11%
Potentially psychotic	6%	9%
Drug-addicted	8%	979
Sex-perverted Feebleminded	179	16
Epileptio	1%	ò%

Of major interest is the group of the approximately normal inmates, it shows a 20 per cent increase of the temperates, which meets our expectations in a comparative study of abstainers and drinkers The 13 per cent increase of temperates among the psychopaths points to the fact that these personality types comprise the more active antisocial elements who do not need to take to what may be called the "alcoholic crutch," thus evading the solution of their life problems A slight increase of the intemperates is noticeable in the two groups of the sex-perverted and potentially psychotic men peculiar effect of alcohol on sex behavior, abating inhibitions of a social or ethical nature, also promotes certain unconscious perverted practices As to the potentially psychotic group, the 3 per. cent increase of alcoholics points to their higher emotional tension, which itself enhances the use of alcohol

The greater emotional instability of the drinkers further manifests itself in the next table, representing those having a history of insanity

TABLE 7

	400 T	400 Int
History of insanity	7%	10%
No history of insanity	7% 93%	10% 90%

However, as mentioned in the previous paper, the relatively small number of psychoses among drinkers points to the theory accepted by many psychiatrists, that alcoholism is more frequently a symptom than the cause of meatal disorder

The following table (types of crimes committed) dopicts a number of lateresting facts relative to the different criminal behavior of our eight hundred temperates and natemperates

TABLE 8

	400 T	400 Int
Murder	12%	11%
Manslaughter		32 67
Robbery	457	32%
Sex erimes (rape incest, bigamy impairing morals of minor) Acquisitive crimes (bur	8%	12%
glary, larceny furgery swindles)	28%	37%
Escape Criminal negligence (fatal auto accidents)	1%	2%
Abandonment ) Arson	1%	1%

Looking at the first two groups of this table, we find that homicide is approximately equally frequent among the abstainers and among the drinkers. However, the temperate killers are mostly emotionally fairly well balanced persons who commit murder deliberately, whereas the intemperates are, in common, emotionally unstable individuals who, after a drinking spree, become argumentative, thereby committing what is legally called manifaughter or murder in the second degree

Noteworthy is the third and fifth group of this table, the former shows a 13 per cent racrease of temperates among the robbers, the latter, a 0 per cent increase of intemperates among those convicted of acquisitive crimes Apparently, "holdups" require coelheadedness and planning, whereas birglanes and forgeres are more easily committed after one has dulled his moral scruples and inhibitions by indulging in an intoxicating beverage

The fourth group (sex crimes) shows a 4 per cent increase of the intemperates-another confirmation of the known fact that alcoholism advances a person's moral doterioration. Tho drinkers in this group constituted the majority of offenders sentenced for incest or impairing the morals of female children Among the abstainers of this group one could allocate most of the active homosexual inmates, legally termed The training of a perverted sex behavior from childhood on, combined with an actively working mind, did not necessitate thn use of alcohol on their part. Most of the interviews with homosexual convicts proved that, in the vast majority of all cases, homosexuality represents a social and erotic misfit which can be prevented by an education genuinely interested in the emotional and moral maturity of all children, including those raised in public or private institutions. In addition, manifest cases of homosexual behavior should be treated mentally and physically in special institutions to be established as an intermediate between prison and hospital

In the former study, the decisive role of "personality" in the course of a man'e life and destiny was stressed and held responsible to a large degree for his intemperance or abstance The next table compares our eight hundred inmates with regard to their character traits

TABLE 9

·	400 T	400 Int
Extrovert, acciable and co- operative	63%	63%
Introvert, unatable anxious and religious Aggressive Jealous	27 % 0 69 1 %	29 % 7 % 1 %

The table shows plausly a similarity of personalities in both groups, the temperates and intemperates. This is intelligible if one considers the fact that an alcoholie who has sobered up for a reasonable length of time and is under close supervision cannot be distinguished substantially from the temperate immate, since his possible moral deterioration is well recognizable only during a more or less continuous state of interication. Criminals are, in general, much more extrovert than introvert, due to their active attitude toward life.

The use of alcohol seems not to alter their extrovert character, as our table shows an equal percentage (63 per cent) of temperates and iatemperates among the extrovort group who drink are more superficial and easygoing than those who abstain, in addition, the intemperates usually manifest an increased physiclogio inclination (taste, etc.) for alcohol Among the introvert type of inmates, we find somewhat more (2 per cent) intemperates than temperates. in other words, alcoholics show greater emotional instability, which coincides with the findings of Tables 6 and 7 It was pointed out in the former study that addicts are less active than other social muslits, conversely, we find a slight increase (2 per cent) of temperates among our decidedly aggressive inmates

#### Conclusions

Summing up our findings of the present survey of pinson inmates and the former study, the following well-established facts can be enumerated

- Excessive drinking affects mostly middleaged persons from 30 to 40
- 2 An alcoholio habit is not necessarily

hereditary, this does not repudiate the scientific experience that chronic alcoholism in many cases has noxious effects on the germ plasm

3 Race does not affect a man's predilection for alcoholic drinks, white and colored persons

equally indulge in intoxicants

4. Lack of education breeds not only crime, but also inebriety, e.g., skilled laborers drink less than common laborers

- 5 Marriage favors temperance, separation or divorce promotes intemperance
- 6 A drinking habit is acquired predominantly under the age of 30 and is supported by a physiologic inclination (taste, etc.) for alcohol
- 7 Environmental factors, specifically sociability, constitute the most potent incentive for drinking (in about four fifths of all cases), mental stress as a motive makes up the rest
- 8 Habitual drinking practically does not impair a man's intelligence except in the terminal stage of chronic alcoholism, however, according to some observers, it may deteriorate the intellectual qualities of the progeny
- 9 Alcoholics evince a comparatively greater emotional instability, this also manifests itself in a larger incidence of insanity in the past history of the intemperates, simultaneously, the relatively small number of alcoholic psychoses among drinkers points to the more or less accepted theory that alcoholism is a symptom rather than a cause of mental disorders
- 10 The use of alcohol dulls the inhibitions that control sex conduct and thus increases the risk of contracting a venereal disease
- 11 There is definite proof that the excessive use of alcohol is responsible for a considerable number of all incarcerations, exactly one third of the inmates of a penal institution committed one or several crimes while in a state of alcoholic intoxication.
- 12 The major part of the gross sex crimes can be traced to the excessive use of alcohol, which abolishes moral and especially sexual inhibitions
- 13 Intemperance does not basically change a man's personality except. (a) in the case of continuous excessive drinking, when moral deterioration sets in, (b) during a state of actual intexication, when sound judgment becomes more or less impaired and alcohol renders the

person a demoralized and temporarily aggressive individual

14 Intemperate criminals who have sobered up and have been under close supervision for a reasonable length of time do not differ in principle in their personalities from their temperate fellow prisoners, both groups are equally more extrovert than introvert, due to their active attitude toward life

After looking through the fourteen points of this summary one may ask what practical lesson social science, especially criminology, including psychiatry and mental hygiene, can draw from surveys of this kind Is addiction to alcohol, seen from a sociologic viewpoint, harmful or harmless, does it promote crime? It seems to me that among all findings the points 8, 11, and 14 of the conclusions may attract the main atten-The first stresses the fact that a person's intelligence is relatively well preserved throughout years of habitual drinking. This might account for the public tolerance and patronage of a custom deeply rooted in human nature and The second quite generally considered harmless important finding unveils a part of the liability which society must meet if it favors the use of Assuming a sum of \$600, at present spent for the yearly maintenance of an inmate, many thousands of dollars of public money could be saved if prisons did not have to admit offenders who committed a crime in a state of alcoholic intoxication, not to speak of further expenses for the relief and support of their families during the time of incarceration nally, our surveys reveal that enforced abstinence over an appropriate length of time is the royal way on which an alcoholic, whether criminal or not, can and must proceed in order to free himself of his habit

A last question comes to one's mind in this connection. Who among the immoderate users of alcohol is generally liable to commit an offense punishable by imprisonment? One may answer pre-eminently those who in their character combine enterprise with antisocial tendencies. Thus we may stress the importance of an education that teaches those concepts of social activity which, unshaken by passion and self-indulgence, remain firm pillars of one's responsibility and moral obligation.

#### IT CAN BE DONE

Tuberculosis can destroy the finest human material in every nation. Yet all modern knowledge shows that this disease, if fought with medical and

social weapons known to us now, can be cured and largely prevented.—Harley Williams, M.D., Am. Rev. Tuberc., Jan., 1945

## APPENDICITIS A SURVEY OF THE LAST TWO THOUSAND CONSECUTIVE CASES

HARRY A. D. O. CONNOR, CAPT, (MC), USNR, and EVERETT M. BESSIE, COMDR, (MC), USNR (From the United States Naval Hospital, Brooklyn)

TO SINGLE tissue or organ in the adult human body causes so much trouble to individuals and so much discussion among surgeons as that vestigial remnant, the vermiform appendix. Even n mere skimming of the surface of recent medical journals-for three years filled with diagnosis and treatment of war injuries and diseases shows hardly a single magazino without at least one article on appendicitis. Descussion and difference of opinion-all marked by formidable collections of data-still center about the time-honored diverging crossroads how to make a diagnosis, when to operate, or should one operate, what type of anesthesia should be used, where the incision should be placed, and how to drain or not to drain, when to give food postoperatively, when to get out of bed, and now, most recent of all controversial points, whether to give sulfonamides or not, and how, and how much

We have no faint hope of being able to settle, once and for all, all these weighty questions, and to determine finally the action of each individual surgeon. But we do hope, by presenting a part of our experiences at the Brooklyn Naval Hospital, to restimulate interest in a disease which still takes a toll of 12,000 to 20,000 lives annually in the United States, and to give a picture of how this troublesome menace is managed in this in stitution. The Navy way, due to the exigencles of the service and needs of the fighting fronts, differs in some respects from the civilian way. And we behave that our experience is extousive enough and important enough to present publicly

The entire series here presented is taken from the service of the senior nuthor at this hospital, and constitutes a completely unselected series of 2,000 consecutive patients operated upon for appendicuts, the last operation having been performed the end of August, 1944, and the first of the series in the middle of October, 1942 a total period of twenty-two and one-half months

A very high percentage of individuals has an appendix which lies behind the cecum and ascending colon. In our series these amounted to 454 cases, or 23 per cent. Besides being retrocecal, the appendix may also be partially or completely retroperitoneal. We had 68 such cases in this series, 34 per cent of the entire series, but 15 per cent of all retrocecal cases.

Read before the Brooklyn Surgical Society December 7

TABLE 1-POSITION OF APPRICAL

	No. of Cases	Percentage
Retrocecal Itetroperitoneal Medial to cocum.	454 68	23 0 3 4
or pelvie	1 478	73 6
Total	2 000	100 0

A so-called "bloodless fold of Treves" has been described When present this fold so completely covers and conceals the appendix that the erroneous impression that the appendix is congenitally absent may easily mise. Usually the appendical mesentery is a small triangular peritoneal fold nitached to the posterior surface of the lower part of the mesentery of the ilcum and carrying the blood and nerve supply of the appendix. As is to be expected, in obese patients the mese-appendix, like other organs and tissues, is frequently so densely infiltrated with fat that it is rendered extremely friahle and difficult, as well as dangerous, to handle surgically

TABLE 2-PATROLOGY

	No. of Capes	Percentage	No. of Cases	Percentage
Acute estambal suppurallys Gangrenous Ruptured	1 138 118 11	58 90 5 90 0 55	1,267	63 88
Chronic No pathology			557 146	29 35 7 30
Total			2 000	100 00

The 2,000 cases in this series included 1,138 cases, or 50.9 per cent, of acute appendices in which the inflammation was catarrhal or sunpurative with or without free purulent fluid in the peritoneal cavity, or mesenteric lymphadenitis, 118 cases, 59 per cent, were pathologically gangrenous, and only 11 cases, 55 per cent, were ruptured or perforated This makes n total of 1,267, or 63.35 per cent, of the entire series, clinically and pathologically neutely inflamed The percentages of gangrenous and perforated appendices are gratifyingly small and contribute largely to our record of but a single death in the entire series Wo feel that this small percentage of the most serious stages of appendicitis is a potent supporter of our argument for early surgery

Five hundred and eighty-soven cases, 29 35 per cent of our senes, were reported as having

chronic appendicitis, and 146, or 7 3 per cent, as showing no pathology at all. This latter group is too small to warrant apology for our diagnostic acumen and represents that group in which we have consoled ourselves with the thought that discretion and surgery were in these cases the better part of valor and risk

#### Preoperative Care

Preoperative care in this hospital has been reduced to a minimum for appendicitis, as practically all of these cases are handled as emergencies. The sooner we operate, the less serious the pathology, the easier the convalescence, and the more speedy the return to full duty. However, if operation is delayed a simple cleansing enema, 1½ grains of phenobarbital by mouth as a sleeping medication, and ¼ grain of morphine sulfate and ½ grain of atrophine sulfate when the patient is called to the operating room, are routine orders.

#### Anesthesia

We are strongly in favor of spinal anesthesia as the anesthetic of choice for these cases Not one single case of the entire 2,000 was started on any other type of anesthesia. One thousand seven hundred and twenty-three were given 150 mg of procame crystals dissolved in 3 cc of spinal fluid, and 184 were given 16 mg of pontocaine "snow" dissolved in 3 cc of spinal fluid All of these had more than satisfactory anesthesia The remaining 93 were given procaine crystals intrathecally, but due either to poor administration, a prolonged procedure because of technical difficulties, or an occasional case in which a seemingly perfect tap was done, yet the patient was apparently refractory to spinal anesthesia, and required the reinforcement of gas-oxygenether by inhalation

TABLE 3-Anesthesia

	No of Cases	Percentage
Spinal (150 mg. procaine) Spinal (16 mg. pontocaine) Spinal reinforced by care	1,723 } 184 }	95 3
Spinal reinforced by gas- oxygen-ether	93	47
Total	2,000	100 00

Just a word on technic As experience has taught us that almost one in every four appendices is retrocecal and frequently extends high up toward the liver, we administer our spinal anesthetic agents at a relatively high level—usually between the first and second lumbar spinous processes, frequently an interspace higher, and always with the patient lying on his left side Every patient has first approximately 2 cc of 1 per cent novacaine injected through a fine needle, then, after dissolving the anesthetic

agent in spinal fluid, it is reinjected into the thecal canal at the rate of 1 cc per minute—a total of three minutes being taken in each case. Three-quarters of a grain of ephedrine sulfate is administered on the operating table just prior to the spinal tap. Blood pressure readings are taken routinely throughout the operation, and we have but rarely experienced a drop in blood pressure sufficient to require the administration of a vasoconstrictor. Our incidence of postspinal headaches has been practically negligible

#### Operative Technic

The controversy over the type of incision still rages. Although the majority of surgeons have adopted the McBurney type of incision in recent years, no lesser surgeon than Lahey has recently advocated an "adequate right rectus incision"

Of necessity, in a large institution such as this, with the staff—medical officers, nurses, and corpsmen—in an almost constant state of flux, and with a brief period being allowed for intern training, it has been necessary to routinize a method for such a frequent operation as appendectomy. We use a muscle-splitting type of incision which varies from the one usually used elsewhere

Instead of incising at the junction of the outer and middle third of a line drawn from the anterior superior spine of the ileum to the umbilicus, as in the usual McBurney incision, the incision made in the Naval Hospital is in the same direction as the McBurney, but only one fingerbreath mesual to the anterior superior spine, with one third of the incision lying above the imaginary line from spine to umbilious and two thirds lying below it After skin, subcutaneous tissue, and fascia are incised in the same direction, the mesial fascia is retracted and the exposed muscles are wiped laterally by packing a gauze sponge directly under the mesial leaf of incised and now retracted This permits the opening of the muscle layers considerably mesially to the incision through the external fascia Muscles are opened by thrusting a curved Kelly clamp through them down to the peritoneum, opening the clamp, and then replacing it with narrow-bladed Aimee re-By pulling apart the retractors the tractors muscles are split in the direction of their fibers with a minimum of bleeding and trauma Muscles are now retracted and the exposed peritoneum is wiped toward the operator Thus, in turn, the peritoneum is opened at a still more mesial line than the more superficial abdominal layers, and again, to increase the safety factor, after a nick is made in the peritoneum with a scalpel it is opened by inserting Aimee retractors The alcohol-phenol and pulling them apart technic is used to amputate the appendix, and

both stump and meso-appendix are doubly ligated with chromic No 2 catgut. The stump is not inverted

After closure of the peritoneum by purse-string suture, it is rarely necessary to use more than two interrupted sutures to close the muscles. Closure of the fascar is one of our points of divergence from usual technic and in our hands the method used has proved more than astisfactory. Instead of merely suturing the cut edges together, the mesnal edge of the external fascin is imbricated into the periosteum of the ihac spine. This gives a double layer of fascia over the lower suture lines, and allows sutures which will hold to be placed in firm tissues.

We have not er seen or heard of n postoperative hernia in any patient whose incision was made and closed in this manner

TABLE 4 -Type or Inciator

	No of Cases	l ercentage
Modified McBurney	1 903	818 CG
Modified McBurney with	86	4 30
Right rectus	11	0 55
Total	2 000	100 000

In 1,903, or 99 515 per cent of our cases, we were able to perform nn appendectomy through the incision we have just described without technical difficulties In 86 cases, 4 3 per cent, due to n fixed immobile cecum with n retrocecal appendix, it was necessary to extend the incision. We extend by a bockey-stick type of incision, directly cephalad from the upper nugle, locising directly through skin, subcutaneous tissue, fascia, and muscle. We may again state that, despite extension of this incision, we have yet to see our first postoperative bernia Eleven patients, 0.55 per cent, were operated upon through a right rectus muscle-retracting incision All eleven of these cases were in womon-Waves or dependents in whom the diagnosis was so doubtful that thorough exploration of the pelvis seemed advisable to the operating surgeon.

Our routimized operative technic for appen dectomy means that every surgeon uses this method, that every nurse and corpeman is trained in n single method, that every intern soon to be released to possibly indopendent duty learns one simple, almost foolproof method of

removing an appendix

It is fairly well recognized by most surgeons that the advent of the sulfonamides has been a powerful addition to our armamentarium for lowering the mortality and morbidity rate of appendicitis. In every case in which the appendix shows gross evidence of suppuration or in which there is excessive fluid in the peritoneal

eavity, we exhibit sulfinulamido intrapentoneally. The average does is a full 8 Gm—all into the pertoneal cavity. We do not dust the successive abdominal layers. The pathology is in the pertoneal cavity, and that is where the drug is placed.

TABLE 5 -TREATMENT

	No of Cases	Percentage
Total cases of acute		
appendicitis	1,267	
Bulla in abdomen	1 101	87
Sulfa by mouth or vein	108	8 5
Wangensteen drainage	1 100	87
Intravenous fluida	1 100	87
Drains (one Penrose)	15	Ö 14

Of n total 1,267 cases of nppendicitis pathologically acuto, sulfandamide in an 8-Gm dose was exhibited intraperitoneally in 1,101, or 87 per cent. We firmly believe that this procedure has been a potent contributing factor to our low mortality-morbidity rates (See Table 6)

TABLE &-COMPLICATION

Deaths Pertionitis and empyoma Wound infection Attlectable Polimonary infaret Polimonary infaret Polimonary infaret Pretionitis Pelibitis (fower extremity) Intellial obstruction	19 13 27 17 12 12
Total	84 (0.27%)

#### Postoperative Management

Postoperatively we have felt it necessary to administer the sulfonamides by either mouth or vein (or both) in only 108 cases, or 8.5 per cent

Every patient receiving sulfonamides by any route is followed carefully by laboratory methods. A daily urinalysis is run for evidence of kidney uritation and the blood sulfin level is determined every fifth day. We attempt to keep the blood sulfin level between 7 and 8 mg per 100 cc, feeling that this is both optimum to combat infection and safe in respect to toyic effects.

We have developed a so-called "peritonitis routine" for the treatment of each case which shows either localized or spreading peritonitis at the operating table Briefly, it consists of four basic therapeutic procedures (1) the administration of 1/2 cc. of 1 2,000 prostigmine parenterally at four-hour intervals for forty-eight to seventy-two hours, (2) the maintaining, for a variable period of time, depending upon the changing status of the patient, of Wangonsteen type of suction through a Levene tube passed through the

nose into the stomach, (3) the rigid maintenance of fluid and electrolytic balance by frequently repeated intravenous infusions of 5 per cent glucose in saline, and (4) the continued exhibition of the sulfonamides by either mouth or vein, depending upon the condition of the patient Eleven hundred patients (87 per cent) out of 1,267 with acutely inflamed appendices were treated post-operatively with Wangensteen suction and intravenous fluids

In only 18 cases, 04 per cent, have we felt it necessary to attempt drainage of the peritoneal cavity. This is a low percentage with 1,267 acute appendices, 129 of which were either gangrenous or actually ruptured. It has been in only the exceptional case that we have found it necessary to continue our "peritonitis routine" for more than forty-eight to seventy-two hours.

Our postoperative patients are fed early, being placed on a soft diet on the fourth day and a regular diet on the fifth day. Although many surgeons may disagree with us, we keep our patients in bed for seven full days, and up to the present have had no valid reason for abandoning this policy. During this bed-rest period a system of graduated exercise is employed to combat possible development of atelectasis or embolism. The average patient is discharged to full duty—with all that that means for a sailor—on the twenty-first day after operation.

In this series there were 80 patients or 0 40 per cent, who required more than twenty-one days on the sick list, and this, of course, was due either to postoperative complications or to such a debilitated condition of the patient before and during his hospital stay that more than three weeks was deemed advisable before again subjecting him to the rigors of the sea and war

We feel that our mortality and morbidity rate is exceptionally low, and compares more than favorably with any set of statistics so far compiled and published. In the entire series we had but one death, this resulting from an overwhelming general sepsis, general peritonitis, and empyema

We had 13 cases of atelectasis proved by x-ray Undoubtedly other cases occurred, but our method of fist percussion over a flattened palm

laid against the suspiciously affected posterior chest wall until the patient coughs up mucus has unquestionably aborted this condition and rendered x-ray findings negative. Two patients developed pulmonary infarcts—visible in x-ray—and seven developed true pneumonia postoperatively. We had one lumbar abscess which required drainage and seven pelvic abscesses which had to be opened. It is of passing interest to note that five of these seven occurred in female patients. One patient developed a full-blown peritorities postoperatively but recovered and has returned to full duty without further surgery.

Twelve patients developed phlebitis of a varying degree in a lower extremity which required prolongation of hospitalization. The recovery of one patient was complicated by an acute intestinal obstruction on a mechanical basis, and required further surgery.

Of our entire 2,000 patients only 9 developed wound infection in which positive cultures were obtained. Occasionally a patient showed a localized collection of serum—bacteria-free by culture—which was evacuated by hypodermic needle, and the wound then continued to heal by primary union.

#### Summary

A series of 2,000 unselected consecutive cases operated upon for appendicates, and with but one death, has been presented

Our standards of diagnosis, our own particular operative technic and postoperative management have been explained

#### Conclusions

Based on this single series alone, we urge

1 More attention to history, and less to physical findings and laboratory reports

2 Appendectomy on suspicion, rather than

on established diagnosis

3 The free exhibition of the sulfonamides in adequate dosage intraperitoneally with liberal use of the Wangensteen type of gastric drainage and of intravenous fluids

4 The adoption of an operative technic which makes appendectomy relatively safe and simple even for the tyro

#### "OUT, DAMNED SPOT"

No person need be told that he has "a spot on the lung" If the condition is as clinically insignificant as the term suggests, the patient should be told that he has a scar from a previous tuberculous infection—one that needs an occasional check-up or one that needs no further observation. Or when the diagnosis is certain, the patient should be told

that his lungs are normal — For, while "a spot on the lung" is often the obscured beginnings of destructive disease, it is, in other cases, the starting point for tuberculophobia and anxiety neuroses, conditions that are no less crippling and hardly more easily curable than tuberculosis itself—Max Pinner, MD, NTA Bull, Jan, 1945

#### SMOKING AND TUBERCULOSIS

HERBERT F SCHWARTZ, M.D., Salisbury Center

From the Pine Crest Sanatorium

MOST phthisiologists feel that smoking is harmful to the patient with tubercules is and the majority of them give this subject due deliberation in the course of treatment. Rules have been set up in sanatoria to discourage the practice, but because of the difficulty of enforcing such regulations the discipline is usually permitted to less.

It was felt that the subject is important enough to justify the time and effort needed to acquire a definite opinion Accordingly, a questionnaire was sent to a number of tuberculous sanatorium directors throughout the country The following

questions were asked

1 Do you think smoking is harmful to tuberculous patients?

2 Do you discourage your patients from

smoking?

3 What rules, if any, do you set up toward control of smoking?

4. What arguments do you employ to discourage the habit among your patients?

The answers were classified as accurately as possible with the following results

Question 1	
(a) Definitely harmful	13 (26 per cent)
(b) Harmful in excess	36 (72 per cent)
(c) Not harmful	1 (2 per cent)
Ouestion 2	I ( I por ours)
(a) Completely forbidden	8 (16 per cent)
	o (ro ba care)
(b) 1 Permitted on rec-	
ommendation of	14.000 ()
physician	16 (32 per cent)
<ol><li>Permitted but with</li></ol>	
out approval	20 (40 per cent)
(c) Not forbidden	6 (12 per cent)
Question 3	
(a) Advice	9 (18 per cent)
(b) Rules	
1 Certain places at	
certain hours	20 (40 per cent)
<ol> <li>Strictly forbidden,</li> </ol>	- ( 1)
on threat of dis-	
charge	7 (14 per cent)
3 Rules not en-	(11 per cont)
forced	11 (22 per cent)
	3 (6 per cent)
4. No rules	3 ( o per cent)
Question 4	
(a) Detrimental to bealth	

and appetite

and larynx

(b) Irritation to bronchi

(c) Fire hazard 4 (8 per cent) (d) None 7 (14 per cent)

Although more than 95 per cent of the men feel that smoking is at least injurious, less than 20 per cent of them feel that it should be completely forbidden. This is apparently due to the difficulty of enforcing rules which are so universally duregarded. We all realize how strong the smoking habit 19, in fact, most physicians themselves can appreciate the pleasure that a cigarette offers. On one hand, therefore, we have a habit which is usually long standing and well entrenched, and which offers the patient a great deal of mental relaxation, and on the other, we have only a belief that there is probably some benefit to be derived from denying the patient this pleasure which frequently becomes almost a necessity

Most phthisologists believe that inhalation of tobacco amake has various deleterious effects upon the appetite, tracheobronchial tree, and larynx, but the literature contains no very definite agreement among the various investigators

The complexity of the problem is enhanced by the number of factors involved, as regards the buman equation the various contents of cigarettes, such as tar products and bygroscopic agents, rapidity of smoking, inhaling or not inhaling, length of the cigarettes, and, of course, the nicotine itself. It has been shown that the temperature of the smoke is infinitely greater in a short stub than m a full length cigarette. It is also greater when smoking is rapid, or when the depth of the inhalation is increased.

The effects of smoking should be considered from two angles—the local and the systemic ef-

lecte

Local changes upon the respiratory system involve the entire tract, from the nasopharyax to the smaller branches of the bronchial tree and depend upon the following

Type of cigarette and tobacco

Type of hygroscopic agent
 Rapidity or frequency of "puffs"

4. Inhalation vs. puffing

5 Depth of inhalation

6 Length to which agarette is consumed

Use of eigarette holder and filter

 Presence or absence of "prominent points" or points of obstruction in tracheobronchial tree. Constitutional changes involve circulation, respiration, skin temperature, blood pressure,

1539

8 (10 per cent)

31 (62 per cent)

metabolic rate, oxygen consumption, and appetite These also would vary with the above-mentioned factors

One must not lose sight of the effects of withholding cigarettes from patients The more confirmed smoker suffers from a reaction which is equivalent to "withdrawal symptoms." This craving is probably enhanced by the attending circumstances, in addition to learning that he is ill and that he is to be confined for an indefinite period of time, the patient is denied the solace of a smoke To quote Head, "When one smokes, he is content to sit and do nothing else. He is stimulated physically, and soothed mentally Pressing problems and the worry and perplexity of existence can be put off momentarily while one withdraws behind his smoke screen comes out he is perhaps a little better able to rest than when he is keyed up and the mind is in a state less easily daunted However this works, it is certain that smoking weaves itself into one's whole scheme of life It is a pacifier, a stimulant, a temporary retreat One's whole psychology and physiology become dependent upon it"

## Tobacco and Smoking Variants

There seems to be no paucity of information on the general effects of smoking. The lungs constitute one of the largest and most rapid organs for absorption and it has been proved that drugs injected into them are absorbed more rapidly than by any route save that of the blood stream. Tobacco smoke contains micotine, 2-4 pyridine and pyridine derivatives, carbon monovide and carbon diovide, ammoma, aldehydes, hygroscopic agents, flavoring substances, cigarette paper, methylamine, methane, furfural, methyl alcohol, arsenic, carbolic acid, and prussic acid.

Of the many elements, mootine and tar are thought to be the most harmful Chapman<sup>5</sup> and Bastedo<sup>6</sup> consider that mootine is the only constituent of tobacco smoke which is present in quantities sufficient to exert harmful effects. It is the most characteristic component of tobacco and is a truly physiologic irritant. Mc-Cormick' feels that both mootine and tar are the most harmful, the first irritates not only the mucous membrane of the respiratory tract but it also acts on the nervous, circulatory, and gastrointestinal systems. Hiestand<sup>6</sup> states that the effects of cigarette smoke are due solely to absorbed micotine.

The quantity of nicotine absorbed and hence the quantitative effect of the smoking vary with

1 Inhalation vs nominhalation Bodnar<sup>9</sup> reported that 6 per cent of the nicotine is absorbed by nominhalers, and that 93 per cent is absorbed by "inhalers," none of which is excreted in the urine

- 2 Type of tobacco Domestic tobaccos<sup>10</sup> contain 2.5 per cent nicotine, while "denicotinized" cigarettes contain about 1.1 per cent
- 3 Number of cigarettes consumed It is estimated that each cigarette produces 11 from 13 to 37 mg nicotine in the smoke
- 4 Speed of smoking Burning a cigarette in five minutes produced ten times as much nicotine as burning one in ten minutes
- 5 Length of cigarette The last one third was found 10 to contain 16 per cent more nicotine.
- 6 Presence of filter This is a definite help because it strains out not only some of the micotine but also some of the tars
- 7 Smoking indoors This is more harmful than smoking outdoors because of the inhaling of the smoke-contaminated atmosphere in addition to the cigarette smoke itself

#### General Effects

- Gastrointestinal System -There appears to be pretty general agreement that the effects upon this system are deleterious Carlson and Lewis12 showed that nicotine stopped hunger contractions Meyers13 feels that the micotine itself is the guilty factor in smoke which irritates the gastrointestinal tract Mendenhall1 blames tobacco for loss of appetite, favoring of duodenal ulcers, carcinoma of the mouth, and chronic intestinal catarrh In a questionnaire conducted by Short15 among more than 2,000 healthy, ambulant individuals, there was an increase among smokers of 100 per cent in "heartburn" and in other digestive symptoms from 62 to 112 per cent
- 2 Metabolism—Cigarette smoking caused an increase in metabolic rate<sup>8</sup> of 82 per cent of the group tested, the average effect was 8 9 per cent elevation. The maximum effect was reached immediately in some cases and was delayed as long as forty-five minutes in others. The first rise was typically followed by a second rise reaching its summit about forty-five minutes later. One can readily see the effects of this on chronic smokers. On the one hand there is a constant "hift" which is probably one of the reasons for the habit, but on the other hand a rise in metabolic rate, occurring twenty or more times daily, would not be very desirable to a patient "on the cure"
- 3 Circulation —Hiestand<sup>5</sup> found an increase in heart rate in 72 per cent of the persons tested but it returned to normal in fifteen minutes Main<sup>15</sup> states that the heart rate and blood pressure did not return to normal for thirty to sixty minutes. Short's questionnaire was conducted in such a manner that the symptoms were not associated in the patients' minds with their smoking habits. There was a fifty per cent increase among smokers for palpitation of the heart

and a definitely increased tendency toward dyapnea on exertion Mendenhall also believes that tobacco raises the blood pressure and increases the heart rate

Nervous System .- The effect here is paradoxic To quete Head,1 "Smoking, as we have seen, stimulates the sympathetic nervous system and has certain sedative effects upon the cerebrum" It may be, too, that in larger doses the sedative effect gives why to a simulating effect or irritation. The constant rise in metabolic rate. should, in time, offset the pacifier action of the cigarettes Meny of us have noticed a decline in nervous tension that eventually occurs when amoking has been ubandoned.

Respiratory System - This should perhaps be considered under the heading of local effects, but some of the phenomens which occur are due to the nicotine absorbed into the system rather than to the local irritation. Main's found that the alveolar carbon dioxide was depressed for half to n full hour following smoking We should also mention here the increase in the prevalence of dyappea on exertion which Short found among

smokers

#### Local Effects

This term refers to the mouth and respiratory tract and is in the nature of a local mechanical insult to the mucous membrane, produced primarily by the heat and the tar of the tobacco smake. The tar, which is the product of the stems and yours of the tobacco leaf, contains12 nicotine, phenolic bodies, pyridine bases, and ammonia The heat of the smoke depends upon the length of the stub and the speed and depth of inhalation Rapid smoking may result in the smoke reaching the mouth at a temperature of 112 to 115 F 11

That smoke has a local irritating effect seems to be pretty well agreed McNally, Menden hall,14 Heffman,17 and Roffo16 all feel that the tar and tar products of tobacco smoke have a deleterious effect upon the mncous membrane of the upper respiratory tract. In fact, so irritating are these products that they are considered to be one of the culprits in the increase of cancer of the mouth and lungs. Roffors states that tobacco tars are very strong carcinoma producers, that they are the same form as the coal tars, and that they contain substances whose properties are very much like those of the hydrocarbons distilled out of coal, in their fluorescence and spectrometry A regular smoker consumes one kilo of tobacco smoke monthly, which means 70 cc of tar, in that way the average smoker loads in one year 840 cc. and in ten years over 8 liters of tar into his buccopharyngolaryngopulmonary membranes

Proets19 performed some experiments on rab-

bits The animals were placed in a emoke machino and made to "smoko" ten to twenty eigarettes per day At the end of the day the rabbits were killed and their heads split asunder in the midline and the mucosa inspected for deposits of tar The tar deposits were not generally distributed but were confined to the region of the upper turbinates and the septum opposite The nostril of the rabbit is wide and the most constructed portion of the passage lies just an terior to the stained area. The deposit of tar so produced etopped the action of the calia, probably by its mechanical presence and by the drying notion of the smoke stream

These experiments corroberate the observations of Roffo of the deposition of large amounts of tar and tar products upon the mucosa of the respiratory tract. On the other hand, the literature contained no papers which discussed positive clinical findings in smokers as opposed to nonsmokers Procts did start a clinical study but found a tremendous variation in the interpretation of the "normal mneesa" Several bronchoscopists, when questioned, stated that they could recognize no difference between the bronchial mucosa of the smoker and the nonsmoker Ballenger, in a discussion of Moyers' paper, states as follows "Two or three years ago we examined 200 or 300 young medical students to determine the relationship of the amount of smoking and any local evidence of irritation in the pharynx or nose as manifested by redness or inflammation of the mucosa or by hyperplasm of the lymphatic tassuo of the pharynx We were unable to find any correlation between the amount of smoking and these findings The absence of redness of the pharynx may possibly be due to the peripheral vasoconetricting notion of the tobacco smoke,"

It also may be that the changes are microscopic or physiologic and are thus rendered in visible on chnical examination

Crampton<sup>11</sup> states that irritation of the mucous membrane of the upper respiratory tract is of some, though minor importance Hewever he does admit that

- Smokers have more colds
- Colds last longer in amekers
- Sinus involvement is more frequent and persistent in smekers
- 4. Smokers' cough of chronic pharyngitis is common

Short,12 In lus questionnaire, found an increase of 300 per cent for cough nmong smokers Morton is feels that many amokers suffer from some degree of tracheobronchitis which under ordinary conditions may be nearly asymptomatic. but under certain conditions may lead to true

All of these findings are among normal people, with apparently normal mucosa When we consider the respiratory tract lining of persons with active tuberculosis, with large quantities of thick, viscid sputum and with actual tracheobronchial lesions which make excellent projection points abutting into the smoke stream, it is difficult to see how trauma can be avoided

A vicious circle is thus instituted, the inflamed mucosa produces a point upon which the smoke impinges, this in turn produces dryness and immobilization of the cilia which encourages implantation of bacilli and more lesions. This train of events doesn't necessarily occur in each case, but smoking should certainly be interdicted in a person with excessive sputum or a tracheobronchial lesion

#### Discussion

The problem is the same with tobacco as with alcohol

A sound individual may bear what for him is a moderate dose without injury Men differ in their response to tobacco as to other things, and this must be borne in mind when attempting to draw conclusions The physician must recognize the fact that smoking is a universal affair, that it has a very definite pleasure component, and that it is usually a longstanding habit.

The mere establishment of rules will not produce the desired effect, the patient must be educated to the dangers of smoking before he will be ready to yield a known pleasure for a doubtful advantage Rules are necessary, but they should be accompanied by frequent explanations of the raison d'etre

#### Summary

A questionnaire was sent to about fifty sanatorium directors to obtain their opinion concerning smoking Only 2 per cent felt that it was not harmful, but only 16 per cent had rules which ngdly forbade the practice Most of the men permitted smoking in certain cases or ignored the fact that the rules were being broken attitude is engendered by the fact that it is quite difficult to discourage patients from a habit of long standing in return for a benefit which is An examination of the of questionable value more recent literature leads to the conclusion that since smoking is harmful even to normal people it is bound to have a deleterious effect upon the respiratory tract of individuals who are suffering from tuberculosis

It is felt that the best approach to the problem would be a definite rule forbidding smoking with frequent explanations about the dangers inherent in the practice

### EDUCATION IN TUBERCULOSIS CONTROL

No plan for tuberculosis control in industry is complete unless education on the subject is continuous and has been made a large part of the pro-There is much skepticism in some of the workers as well as in management of the value of educational measures Yet no one is willing to deny the insurmountable difficulties which obstruct efforts to prevent disease where ignorance of the dangers and of the protective possibilities exists. The objective is to impart information which will function practically in the immediate routine of our common daily life —T Lyle Hazlett, M.D., Ind Med., Mar., 1944

#### ALWAYS ESSENTIAL—GOOD HEALTH

When a nation goes to war, physical fitness of the young men of the country is a vital matter Fortunately or unfortunately, fitness in our modern civilization, though desirable, is not so essential. Whether a man can chin himself seven times, or jump two feet, is not so important, but maintenance of good health is important. We can recollect many examples of individuals who would be rejected for military service but have been outstanding in business, the professions, and the arts. These men and women have triump ed in spite of physical disabilties—Ed, Minn Med, Dec, 1944

#### PHTHALMIC GOITER ITS CONSERVATIVE TREATMENT

Bram, M D, Philadelphia, Pennsylvania

treatment of exophthalmic goiter is sung through a transitional phase that ventually place it in the field of internal ne. There are several reasons for this

The specific cause of the disease is still ua-

The cause does not reside in the thyroid this is attested by nearly all observers

"Thyroldectomy, though capable of n measure of practical success, is a good lve, but palliation is not cure."

The incidence of postoperative progressive lignant exophthalmos indicates that even argery appears to be contransdicated in a screentage of cases

The discovery of the effects of thiouracit to this measure as n notoworthy addition a armamentarium of the internist who as the responsibility of treatment of these is

#### Nature of Exophthalmic Goiter

exophthalmic goiter we here imply the syncommonly designated as Graves' disease,
's disease, Basedow's disease, hyperthymyth diffuse hyperplastic gotter, and
ry hyperthyroidism Since on occasion
led exophthalmic gotter presents neither
thalmos aor golter, this misleading term
d become obsolete

phthalmic goiter is not goiter, and the r we remove the malady from the classification of goiter the sconer will we approach reality cause and management. I would define es' disease as a general acureendorme dysco, of Insideus, rarely acute onset, chartised by aervousness, hypermotabolism, r, weakness, dermographia, afebrile tachya, a relative immunity to diachonism, and ly by thyroid hyperphasa and exophthal-

ophthalmic goiter and toxic adenoma are "different manifestations of the same dis"In 1913 Henry S Plummer' called attento the aced for differentiation, pointing out toxic adenoma is true hyperthyroidism. It is the experimposition of toxicity upon a loaging simple thyroid neoplasm of about fifyears' duration. It is therefore clear that, preparatory medical attention, toxic adea requires surgery. Thyroidectomy eradicates.

the cause of the symptomatology and the patien recovers unequivocally

On the other hand, is exophthalmic goiter, a pointed out by Warthia, Simpsoa, Moscheo witz, and others, we are dealing with a predis posing personality, the "Graves' constitution," requiring attention act to the lump on the aecl but to the individual as a whole. To put 1 simply, in touc adeaoma it is the thyroid tha makes the body sick, while in exophthalmic golte it is the body that makes the thyroid sick rolo of the thyrold gland per se in causation o Graves' avadrome is probably little, in symptomatology its role is usually considerable. It is this circumstance that causes the thyroid gland to become so often incriminated, when as a matter of fact the thyroid is more sinned against than sunning

#### Psychic Trauma in Causation

Predisposition alone is usually an unconscious quality, largely objective, typifying but not incapacitating the individual. It is pears that in the abseace of an exciting cause susceptibility may not tangibly mar efficiency and well being throughout a normal span of existence. Doubtless there are thousands of persons susceptible to exophthalmic golter who are going through life in an apparently aormal manner, oblivious to possibilities which would probably follow the occurrence of an exciting cause. In our series of cases reported a few years ago, approximately 90 per ceat presented a history of psychic trauma which significantly preceded the symptomatology

The term psychic trauma, based on the fear instruct, is applicable to situations in which, with or without physical injury, the mind has received an impact or shock from which it does not readily recover its former poise. The shock may result from a cause acutely, subacutely, or chronically operative

Just as some persons present undue sensitivity to drugs, foods, pollens, and temperature, so do those predisposed to Graves' disease react to one or another type or degree of psychle and environmental irritant. They appear incapable of satisfactory adjustment to adversity. In a situation in which the instinct of self-preservation is called upon to decide between fight and flight, the sensitive individual is singled out of the crowd to become the subject of exophthalmic gotter During a confiagration, an earthquake, a ship-wreck, or an aatomobile or train accideat, 99 out

ad by invitation before the Clinical Society of the New Polyolinic Medical School and Hospital, March 5, 1945.

of 100 persons may emerge from the harrowing experience to recoil to usual physical and mental health. One of them, however, quickly or gradually develops symptoms merging into the typical picture of "frozen fright" characterizing exophthalmic goiter. The eyes stare, the heart palpitates, there is subjective and objective trembling, the skin remains moist, insomnia becomes complete, emotionalism dominates mental existence, there is rapid loss of weight, and the basal metabolism rises. This form of psychic trauma (imminent danger to life and limb) is but one type of emotional insult elicited in the history of these patients.

While in many cases the first psychic trauma is regarded by the patient as the origin of symptoms, in others two or more such provocative experiences are held responsible in the history Occasionally three psycluc traumata may be experienced with apparent impunity, yet a fourth or fifth of another character appears to break down the remaining resistance to Graves' syndrome, constituting the "straw that broke the camel's back" For instance, a young married woman went through her first difficult childbirth Another pregnancy, several fairly successfully months later, terminated in a so-called "nervous breakdown" When, shortly after delivery, she became pregnant again, the intense apprehension resulted in a frankly outspoken attack of exophthalmic goiter Again, a young man, having after much difficulty settled himself in a promising business, in course of time became bankrupt and was obliged to secure a position of an inferror nature to keep body and soul together This blow he faced bravely and with fortifude But the loss of a parent shortly afterward led to persistent nervousness for which he finally sought medical aid The doctor relieved him of the major part of his complaints, then suggested the removal of his infected tonsils as a safeguard against recurrence of symptoms Within two weeks after tonsillectomy the patient began to feel unusually nervous and again consulted his physician, who now made a diagnosis of exophthalmic goiter Apparently the psychic trauma incidental to tonsillectomy was the "last straw" For those further interested in the subject of personality versus environmental maladjustment as it relates to the cause of Graves' disease, I would heartly recommend the perusal of Crile's masterly monograph, "Diseases Peculiar to Civilized Man," published in 1934?

When do symptoms assert themselves following an experience of exciting cause? This varies with individuals Rarely the syndrome appears almost at once, in which case we may be faced with the tragic picture of acute Graves' disease Ordinarily a period of weeks or months may

elapse, during which time the disease exists in occult form, and many errors in diagnosis are possible, chief among these being nervous exhaustion, neurocirculatory asthema, gastric ulcer, heart disease, paroxysmal tachycardia, anxiety neurosis and, occasionally, a psychosis. In some of these misdiagnosed cases, it is only after the appearance of thyroid swelling and eye symptoms that the true clinical picture becomes evident

#### Treatment

Unfortunately, the term "conservative" or "medical" treatment as apphed to exofithalmic goiter has been generally improperly defined. In most quarters it has meant rest and iodinization. This inadequate conception of medical treatment is responsible for the many failures from non-surgical attention and has been equally responsible for the popularity of thyroidectomy in this affection.

#### Infectious Foci

In our experience, focal infections in Graves' disease are usually coincidental rather than However, irrespective of causative unimportance, focal infections require correction When to remove infectious foci is a problem upon which may depend the prognosis and even the life of the patient Precipitous action is hazard-In a case of early Graves' disease, in a patient who faces the operative procedure with little or no apprehension, a tonsillectomy, for cuample, may be performed early with minimal reaction If the syndrome is well advanced, however, it is best to wait for marked improvement, as any added shock, whether it be emotional strain, tonsillectomy, or the extraction of a tooth, may convert a hopeful clinical picture into one of acute anxiety for all concerned

#### Rest

In the average case a rest program is not imperative Rest from undue physical and mental excitation, yes, but a prolonged stay in bed as an invalid is neither necessary nor desirable. Over 85 per cent of our patients are ambulatory and most of them continue their usual tasks during treatment. If, however, the heart is enlarged and arrhythmic, everything must subserve circulatory stability and restoration of cardiac reserve, and so the patient must submit to a preliminary period of inactivity, following which he is managed as an average patient. In all cases, regardless of type, an early-to-bed routine is imperative.

The fewer the visitors, the better Occasionally relatives, friends, or neighbors cause the doctor more worry than do patients Relapse may occur in a patient shocked by a well-meaning

neighbor who, to make herself interesting, had thought it best to communicate to the invalid the worst nows she could find

#### The Diet

Unless the nationt is obese (an uncommon circumstance in Graves' disease) ho must virtually ent his way to health Ten, coffee, condiments, spices, and alcohobe substances are forbidden Smoking, too, must be stopped Flesh foods may be given once a day Bread and buttor. cereals, the dairy products fruit, and vegetables should be taken in maximal amounts

A patient responding promptly should gain on an average of 6 or 8 pounds during the first month, after which an ny orage of a pound a week is quite satisfactory until the weight is restored to normal Commonly the discharged patient weighs 10 or 15 pounds more than before the inception of the disease

#### Drugs

In our experience, the drugs found useful in the management of Graves' disease are five in number quining, iodine (in minute doses), prostigmine, the barbiturates, and thiouracil

Quantine -In 19201-11 and on n number of occasions since, I called attention to the singular tolerance to quinine ovidenced by nearly 95 per cent of sufferers from active Graves' disease Depending upon the severity of the syndromo, these patients were able to take from 30 to 90 arains of the suifate or the hydrobromido a day without developing cinchonism When, within a few weeks of this medication, there developed a sense of roaring in the ears and it was necessary to reduce the medicament, we found that the symptomatology of the syndrome was ameliorated in parallel degree. And when normal intolerance to quinine appeared, the patient was usually symptom free. Aside from its use as n diagnostic test, the therapeutic value of large doees of quinino is gratifying The average dose given during the active stage of the syndrome is 5 to 15 grains two or three times n day Allergy to quinine was encountered in approximately 3 per cent of the patients, and it was for this reason that large doses were administered only under close control of the patient. As quinine is all but unobtainable since Pearl Harbor, we have been obbged to discontinuo quinine therapy "for the duration"

Iodine -- Iodino is too often abused, and in case of doubt it is best to omit this drug. If used, it is well to employ minute doses, as this would safeguard against the unfortunate lodine-fast status We favor an iodized calcium, not Lugol's solution Sajodin is an excellent prod-

This is calcium iodobehenato, best given in dozes of 1/2 to 1 grain daily in divided doses.

Prostiomine -- Recently we found that the oral administration of prostigmino bromide, though quite similar to esempo in physiologic effects, is superior to the latter in that it is more stable, and produces less myosis than eserino Prostremmo reduces the violence of the heart netion, reduces intraocular tonsion, and constricts the palpebral fissure. The effective close of prostigming is 1/2 to 1 tablet (71/2 to 15 mg) two or three times n day In the presence of diarrhea. sudorrhea, or severe sweating prostigmine is contraindicated Other contraindications are coronary disease and beart block, rather rare complications of exophthalmic goiter

The Barbuturates - The barbuturates stand foremost as sedatives and for the prompt relief of insomnia, but care must be exercised in the selection of the product and desage Barbital in doses of 2 or 3 grains three times n day or phenobarbital in one third this dosage usualiv serves the purpose well Within a few weeks these remedies may be gradually tapered down in decage as the patient improves generally, and

are finally discentinued

Thiouracil -Though n nowborn babe in chemotherapy, thiouracil is becoming a lusty voungster that bids fair to expedite the recovery of sufferers from Graves' disease. We are using thiournal in a series of 45 patients at present and find this substance of distinct value in eliminating the symptoms of thyroid participation This is apparently accomplished by a curbing or arrest of the synthesis of thyroid hormone within a fow weeks The so-called "chemical thyroidectomy" is apparently accompanied by an increased ontput of thyrotropic hormone by the enterior pituitary, causing the thyroid to become more hyperplastic, with a transient increase in its size, and occasionally an aggravation of the exophthalmos

Accentuation of thyroid awelling and exoobthalmos is neither constant nor permanent, these symptoms clearing up in course of time while the individual as a whole is under general attention. We are using thiouracil in smaller doses than do others, not as a mainstay to the exclusion of other measures, but as a supplement of considerable promise in the future. Along with one or more of the above-mentioned medicaments given in this series, we are administering thiouracil in tablets of 0.1 Gm, three times a day at first, and as the patient becomes symptom free and the basal metabolism and blood cholesterol reach normal, the daily dosage is reduced to two tablots. As mild hypothyroidism is approached, our dose is one tablet daily as the maintenance dose. Within a few months, the

drug, along with other remedies, can be withdrawn We find that the inclusion of thiouracil in the conservative management of exophthalmic gotter saves much time in the rehabilitation of these patients to normal existence thetically, I might say that these small doses of thiouracil were not accompanied by the many complications reported from its use in double or triple the doses herein mentioned Only one of our patients developed a mild maculopapular rash with urticaria on an initial dose of 02 Gm daily, taken for two weeks, and this disappeared within two days after withdrawal of the drug It would seem that the cause of most of the complications reported from its use is toxicity from overdosage I would be especially cautious in the administration of thiouracil to those whose thyroid gland is exceptionally large or whose exophthalmos is severe, and would warn against its use during an infection

#### Psychotherapy

Since exophthalmic goiter, or Graves' disease, is apparently a representative psychosomatic affliction, a word on practical psychotherapy is inevitable. But since the subject of human thinking may take us far afield of our topic, we must be brief. Psychotherapy (as in the case of the term "personality") cannot be clearly defined. Despite lack of specificity of concept, we feel that we know what the term implies, and we take this inner implication for granted.

The doctor assuming the responsibility of the management of a case of this sort must expect occasional emotional surprises and must have fairly successful formulas in dealing with them Also, the medical attendant must be willing to devote ample time to his patient and employ the necessary tact and warmth and paternal spirit in his efforts to eradicate discoverable maladjustments. At each interview, doctor and patient must leave each other in cheerful mood

Regardless of the religious inclination of the patient, attempts at adjustment of doubts and fears will do much to render therapeusis a lighter task. The assistance of a minister, a priest, a rabbi, or a wise family counsellor, as the case may be, may add solace to the troubled soul. Our hope is to assist the atheistic, the bigoted, the fanatic, and the confused into the fold of a healthy faith in God, in self, and in mankind. The serenity of mind and imperturbability resulting from the surrender of the emotions to an abiding faith may prove assets in the attainment of enduring recovery

In course of time the patient thus managed begins to see his environment less through the medium of his emotions and more through the calculation of logic. The formerly maladjusted individual is thus assisted toward attainment of emotional stability, which spells resistance to recurrence of Graves' syndrome.

#### Course Under Treatment

The course of clinical events in the average case of Graves' disease under conservative treatment as herein outlined is as follows: tachycardia is the first noticeable symptom to improve, the heart rate becoming normal within two or three months, as a rule, depending upon the severity of the syndrome Paralleling the heart improvement, the weight rises and the basal metabolic rate drops gradually to normal The behavior of the thyroid swelling is that of The typical hyperplasia with bruit gradually changes to the resting stage and the bruit disappears. In course of time, usually a few months, involution is completed ever, the thyroid may not reach normal size until after the individual as a whole has been enjoying normal health for several months of an evident minus metabolic rate, the shrinking of the thyroid may be expedited by the cautious administration of desiccated thyroid tremor usually disappears on the return of the basal metabolic rate to normal. If the exophthalmos' is mild, it disappears with recession of the basal metabolic rate. If severe, the exophthalmos may be the last symptom to go, and may even persist for a year or longer after general recovery, and constitute an embarrassing cosmetic problem during that time But eventually, with few exceptions, the appearance of frozen fright becomes a past event. We have had no incidence of post-therapeutic progressive exophthalmos

#### Duration of Treatment

Early cases require but several weeks of active attention. The individual duration of treatment depends upon the age of the patient, the duration and severity of the syndrome, the presence or absence of complications, and the degree of cooperation obtainable. Sufferers from severe Graves' disease commonly present myocardial fatigue with auricular fibrillation and in some cases circulatory decompensation with anasarca. Occasionally the basal metabolic rate exceeds +80 per cent. The duration of the symptoms varies from a few months to twenty years.

Taking into account the foregoing factors, our patients are discharged from active treatment within two to eighteen months of observation, the average being approximately 74 months

#### The Follow Up Method

Since 1910 we have been able to follow up over 3,000 cases of Graves' disease for periods varying from five to twenty-five years Approximately 78 per cent were females. The youngest patient was 21/2 years old, the oldest 78, both were females. The average age incidence was 32

During active treatment our nationis were observed at intervals of from once a week to once a month. Only 8 per cent were institutionalized. for an average of five weeks, then discharged

for ambulatory or home attention

When recovery was reached the follow-up period began Depending upon the distance from the patient's residence, he or she was requested to appear for examination at intervals of three months to n year, the average examination being once in six months. The patient was checked up subjectively and objectively in detail, with the weight, heart action, basal metabolic rate, thyroid, eyes, sense of well being, and endurance as indices of recovery

Of our series of patients followed up, 88 per cent were normal insofar as exophthalmic goster is concerned. The remaining 12 per cent, almost invariably severe or chronic cases at the beginning of medical attention, presented some sequelae, especially mild to moderate exophthalmos or cardiac manifestations, chiefly objective, which did not materially interfere with social or economic usofulness

#### Conclusions

In conclusion, I would state that under conservative treatment, coupled with fair cooperation of all concerned, the average sufferer from exophthalmic goiter need not remain an invalid. With reasonably prompt attention to individual physical and psychic problems, for a reasonable time, and usually without material curtailment of customary activities, such a patient can be restored to normal health and normal life expectancy without thyroidectomy

#### A METHOD OF GIVING PENICILLIN BY MOUTH

Trisodium citrate, a sodium salt formed from citne acid, has been found effective in the administrario acq, has been found energive in the administra-tion of penicillin by mouth when given simultane-ously with the drug, according to studies reported by Paul György, M.D., H. N. Vandegraft, M.D., William Elias Ph.D., and L. G. Colio, B.A., of Philadelphia, F. M. Barry, M.D., and J. D. Pilchor, M.D., of Cleveland, in The Journal of the American M.D., of Cleveland, in The Journal of the American Medical Association for March 17

Penicillin is sensitive to acid and alkaline reaction and is easily destroyed by the gastric juices of the stomach. It is for this reason that the difficult administration by injection into a muscle or voin is necessary Where penicillin is taken by mouth, trisodium citrate acts as a buffer (any substance which prevents a change of reaction in solution) This maintains a balance between the scid and beso concontration, thus protecting the penicillin from chemical destruction and aiding its absorption in the gastrointestinal tract. The rate and degree of ab-sorption can be measured by the appearance of penicillin in the blood and the amount of penicillin excreted through the kidneys into the urine

"Trisodium citrate" the investigators report, "was found by Charney, Alburn and Bernhart to be a suitable buffer with the proper buffering range. Administration of trisedium d penicillin by mouth given two hours after breakfast resulted in appreciable increase of the urinary excretion of penicillin when compared with control experiments in which no buffer was used.

The figures for urinary excretion of penicillin given by mouth on a fasting stomach were only slightly increased by the simultaneous administration of buffer and were higher than in the experiments in which penicillin was given after breakfast

'Figures of urnary excretion of penicillin are not an accurate yardstick of the therapeutic effect penicillin might exert while passing through the body On the other hand, the fact that penicillin given by mouth appears in the unne proves that it is ab-

sorbed from the gastrointestinal tract.

"Gonorrhea offered the best approach for the therapeutic evaluation of penicillin when given by mouth. The rapid cure of genorrhea by injected peniculin gave a reliable basis of comparison If it is effective at all, rapid therapeutic effects would be expected after oral administration of penicillin. Even an unsuccessful attempt would cause no sig-nificant delay or harm and could be quickly followed by well-established therapeutic procedures.

They report that the majority of the cases of generates in this study was reasont to treatment by the sulforamides "In all these cases," they say, "cure was achieved in one to three days and with doses [by mouth] of penicillin which appear to be comparable to, and not out of line with, the to us comparate to a new to the principle of the construction. It appears, therefore, that penicillin, at least in combination with a huffer such as sodium citrate is an effective therapeutic agent against gonorrhea. even when given by mouth.

## REATMENT OF CHILDREN WITH CEREBRAL PALSY

ERONICA O'BRIEN, M D, New York City

epartment for the Correction of Motor Disabilities, Neurological Institute)

INCE 1932, children with cerebral palsies have been receiving treatment in the Dertment for the Correction of Motor Disabilities the Neurological Institute One group of paents receives intensive treatment—that is, five eatments a week-and has the services of a acher supplied by the Board of Education of This is a carefully selected ew York City oup of children of normal intelligence whose lysical handicap is so severe as to preclude the ssibility of school attendance in any other The enrollment averages 18 hool group 1e other group of patients, averaging 100, is not Patients come for treatments highly selected ace a week, once a week, or less often About new cases are accepted each year Many paents remain under treatment for six to eight

In the development of the treatment program r these patients, we have found that, except r our own interest, we need not concern ourless to any great extent with many of the oblems of classification or the more obscure atomic alterations underlying the disability owever, there are certain basic neurophysiosic concepts without which it is difficult to preciate the objectives of treatment or to an a program to meet the individual handicap a given patient

In our experience, as in that of other workers, sind three predominating types of motor manistations which occur in the cerebral palsies and hich account for nearly all of the interference ith normal development of motor function hese are spasticity, involuntary movements, ind incoordination

Our present concept of spasticity is based on ie work of Hoefer and Putnam on the action stentials of muscles in spastic patients. Of the laracteristic reactions which they point out, the illowing are found particularly helpful in underanding and modifying the disability of the sastic patient.

- 1 There is no sign of innervation at rest
- The threshold for stimulation is low
- 3 The impulse tends to spread to inapproriate muscle groups
- 4 Motor-unit management is synchronous
- 5 The myotatic reflexes are greatly increased

According to these concepts, if the stimuli saching a spastic patient can be reduced suffiiently to permit a state of rest or relaxation, then there is no innervation of his muscles However, even a slight stimulus, eitlier an external stimulus or an internal or psychic one, is sufficient to set up an exaggerated response which spreads to inappropriate or even to all muscle groups. Sudden contraction in a flexor group sets up a myotatic reflex or stimulation of the corresponding extensor group which in turn stimulates the flexor group, with the result that the patient is unable to accomplish any voluntary action.

The extrapyramidal manifestations in our material are almost entirely confined to involuntary movements We have not found that our attempts to classify these involuntary movements have been very important in our program of re-The work of Putnam and Hocfer indicates that the action potentials in both chores and athetosis resemble each other and resemble normal movement They differ from those of normal subjects in that antagonists are in almost constant simultaneous innervation which may be either steady or irregular in either muscle Tonic fixations are produced by simultaneous maximal activation of all antagonist and synergist muscles of a region and not by a specific form of innerva-Periods of relaxation occur in which no activity is recorded

Our concepts of ataxia or incoordination do not differ materially from those commonly accepted

In addition to the motor manifestation, many patients with cerebral palsy have other congenital defects. Most observers have found the incidence of serious mental retardation to be between 20 and 25 per cent. Our case material shows a similar incidence but shows also that there is no correlation between the severity of the physical handicap and the likelihood of intellectual defect. We have had many patients with mild or moderate physical handicaps who were frankly defective and at least one patient so severely handicapped that he can sit erect for only a few seconds without support, whose I Q is above 140.

Congenital hearing defects occur in more than 10 per cent of cases of cerebral palsy. So far we have not been able to devise satisfactory methods of testing the various types of sensation—particularly proprioceptive sensation—in our patients. However, it is apparent that sensation is disturbed in many cases of cerebral palsy and that muscle retraining is infinitely more difficult when proprioceptive sensation is reduced.

The factors which may determine the produc-

tion of a cerebral palsy are still far from completely understood. It is rapidly becoming unfashionable to consider many, if not most, of these disabilities the result of actual physical traumn to the head during birth Analysis of 134 birth histories of our patients shows normal spontaneous deliveries with uneventful neonatal periods in over one half of the cases Of the cases in which forceps were used, an unfavorable presentation (posterior, transverse, or breech) was the indication in 75 per cent of the cases, and uterino inertin was the indication in another 10 per cent. Some degree of asphyma occurred in nearly one third of the cases. Signs indicative of intracranial hemorrhage occurred in 10 per cent of the cases

It is extremely difficult to evaluate these statistics, since we are all aware that some difficulty in delivery and some degree of difficulty in resuscitation occur in hundreds of cases without appreciable damage to the infant It is of some interest in this respect that of these 134 cases, 107 were discharged from obstetrie services at ten to fourteen days without any recognized variation from normal and without comment as to any complication Of the 27 cases in which comment was made in the discharge note, as to complication either of delivery or of noonntal period, definitely favorable prognosis was given in 10 cases, definitely uninvorable in only 6 Except for the cases of icterus gravis neonatorum, we were unable to discover any correlation between the degree of difficulty encountered either in delivery or in the neonatal period and the severity of the resultant disability

Since the inception of our program, we have found that adequate care of children with carebral palsy has called for a constantly widening viewpoint and includes intention to the emotional, social, and educational needs as well as the use of mechanical alds and orthopedic surgery whenever indicated

However, the cluef conservative form of treatment and the basic factor in the treatment program is corrective physical education. The therapists in this department are graduates of accredited schools of physical education and have graduate credit, proferably leading to a master's degree, in the field of romedial exercise. We believe that this educational background, which insures that the therapists are trained as teachers of physical education, have thorough familiarity with the technics of securing active cooperation from young children and of presenting the material in a form acceptable and understandable to children is an important factor in success with the child patient.

Programs of remedial exercise are individual for each patient and depend upon an analysis of the

motor patterns of each patient with determination of the specific manifestations which are present and the degree to which each manifestation interferes with voluntary action

During infinity, passive movement is used to prevent contractures. In treating the spastic patient, caution must always be exercised to perform each movement so slowly and with such steady pressure that the myotatic reflex is not excited. In instructing the mother in the teclinic of passive exercise, this point must be re-empliasized in teach visit.

When the child is old enough to understand instructions and to attempt to follow them, more active treatment is begun

Treatment of spasticity is begun by reduction of external stimuli to a minimum in order to produce a state of rest or relaxation. Every factor that will contribute to the mental or physical comfort of the patient is utilized. In small children, a sense of security from falling is often a prerequisite for relaxation so that we frequently pile pillows around the excress table or place n chair at the side of the tablo merely to reassure the patient. The spastic child may be supported in n small pool of warm water which is kept at a constant temperature. However, if the patient is npprehensive, the procedure will not promote relaxation and should be discontinued.

When the spastic patient has been put at rest or relaxation by external means, he is trained to recognize this state and trained in the technics of ritaining this state voluntarily. Of these technics, visual imagery and alternating contraction and relaxation are found most useful. In using visual imagery, we suggest to the child an appropriate object or situation which connotes softness, quietness, drowsiness, etc.—a rag doll, a pillow, a quiet pool, clouds, etc.

In securing voluntary relaxation of single muscle groups, we train the child first to contract the group strongly and then "let go". We focus attention on the "letting go" until the child is able to recognize and reproduce the relaxation

The spassic patient is next trained to attempt ample voluntary movements of large joints without movement of inapprepriate muscle groups. These simple movements are later combined in sequence to make useful motor patterns.

In reducing the interference of involuntary movements, we begin with the training in relaxation since it is commonly found that many patients with involuntary movements tend to maintain a state of contraction in an effort to suppress the involuntary movements. Association of voluntary movement with a well-defined rhythm is found very helpful in reducing the interference of involuntary movements. Music in 4/4 time may

be required at first, later counting, still later the rhythm may become automatic. Mental and visual concentration on the objective of the movement rather than on the moving extremity greatly increases the efficiency of the movement.

The treatment of ataxia depends largely on the visual orientation in space of the ataxic extremities. Placement exercises are graded with the patient first checking the movement by direct observation, next by observation in a mirror, and then by orientation with a fixed object.

Although these procedures may be described quickly enough, in actual practice, of course, the procedures are stretched out over endless months and years and we rarely come within close range of our objectives. However, to a considerable extent, our measure of success is dependent upon our understanding of these principles and our accuracy in analyzing the disability of an individual patient and planning his program. An important function of physician, therapist, or both is constant advice and guidance of the parent as to what motor functions can reasonably be expected of the patient at a given time

If intelligence is sufficient to permit cooperation, there are very few patients whose functional motor state cannot be improved patients improve so much that their eventual motor development is within the average range Most patients show a residual motor handicap The prognosis in regard to specific acts (in particular, independent walking) is complicated by many extraneous factors such as rate of growth, height, weight, etc Corrective physical education is least effective in reducing involuntary movements, more effective in correcting the functional results of either spasticity or incoordi-There is considerable reason to believe that further work in the field of neurosurgery will offer greater relief from the interference of involuntary movements

The degree to which the residual motor handicap interferes with the life adjustment of the patient depends to such an extent on social and educational factors that really adequate treatment of the cerebral palsy patient requires close cooperation of physician, qualified therapists, psychologist, teacher, and social worker

#### FLYING FOR FUN

For all doctors who would occasionally like "to get away from it all," we suggest flying We have tried about everything, and nothing before has got us quite so far away from medicine as this

One can go fishing, and alone, as one relatively is when fishing, he can still think about patients and stew about medical problems—scientific, economic, political, and all the other aspects. If he plays golf, and if his partners are doctors, as they are likely to be, the conversation is usually about "I had an interesting case the other day." The same is true of bridge parties, and even poker to a less extent Alone in a canyon, stalking the wary deer, or sitting in a duck blind in the cold gray dawn, he wishes he were sure whether Mrs Jones has an ovarian cyst or a tubal pregnancy. The doctor usually eats with doctors, and the conversation is medical. When most doctors write, they write medicine. Even when those about him are not doctors, he is usually engaged in medical questions, answers, and explanations, sometimes in heu of office visits

Flying along at an altitude of three or four thousand feet, relaxed—the modern airplane can fly itself

better than an amateur can fly it—with no telephone (and few patients or hospitals have two-way radios, and the plane need not have one), one can see the forests instead of the trees. Irritations that seemed big at the hospital, in the office or at the medical meeting, fade away in the bird's-eye view of the shades of brown and gray and green in the fields, the geometric patterns of the farms, the right angles of the roads, the long straight lines of the railroads, the winding courses of the rivers, the clouds not far above, or perhaps on a level with the ship, the smoke rising from factory chimneys far below, insignificant dots that are only insignificant people scurrying about on the ground, trains hurrying to get someplace else, the white snow peaks of the mountains, hundreds of miles of them

And for the too blase, those whom even these things would not transport into another world, we suggest some tailspins. We think there are few doctors who, in the process of tailspins, could think of anything else but tailspins. At least we have not been able to—as yet—Rocky Mountain

M J, Dec, 1944

#### PERORAL ENDOSCOPY ITS AID TO CLINICAL DIAGNOSIS

DAVID IDE, M D , F.A C S , New York City

(From the City Hospital)

PERORAL endoscopy is a general torm used when examination of the larynx, trachcobronchial tree, bypopharynx, esophagus, and stomach is made by means of electrically lighted tubes inserted in these regions by way of the mouth Practically all endoscopic tubes are bollow and rigid, with one exception—the enstroscope

The unusual interest in such organs of the larynx, tracheobronchial tree, esophagus, and bypopharynx has stimulated, as Chevaller Jackson' would say, "look and see" No more is the treatment of diseases in such locations a hit-and-miss procedure Of course, there are other clinical methods which are of paramount importance in diagnosis Suffice it to say, peroral endoscopy is not to be used as a substitute, rather as an adjuvant, to our armamentarium of diagnostic facilities. Howard Lillianthal's states, "The scope of bronchoscopy has rapidly widened from the mere extraction of foreign bodies to the diagnosis and therapy of many pulmonary lesions, such as abscess of the lung, tumor of tho lung, bronchial narrowing, bronchial ulceration, mapping of the bronchial tree, or roentgen ray demonstration and localization"

Clerf and Crawford's state, "Bronelioscopy has afforded opportunities for repeated direct observation of growths and for securing ample material for histologic examination, thus adding greatly to our knowledge of the life cycle of many of these tumors" They further state "From the standpoint of the clinician, it is desirable to arrive at fairly definite conclusions early if one is dealing with caraneoms of the bronchus."

A persistent cough, with or without hemoptysia, and a variable roentgen interpretation should be investigated by bronchoscopy Nonmalignant tumor formation, ulcerations, and crossons should be looked for Smears from secretion for organisms should be examined, particularly for the tubercle bacillus.

A word for the anesthesis used in peroral endoscopy. For the proper fulfillment, the three outstanding requirements for the technic are first, the patient's life must not be jeopardized, second, the endoscopic procedure must be performed quickly and expediently, and third, the procedure must be performed with the minimum of pain and discomfort.

In Jackson's Temple University clinic, the following procedure is followed 4

Premedication, as a rule, consists of an appropriate dose of morphine and atropine, and in especially apprehensive patients or in patients known to have a tendency to sensitivity to the local anesthetic drugs, a preliminary dose of nembutal may also be given, but this has not been routine. Sometimes a dose of nembutal is given the night before, and this dose is repeated in the morning. The usual dose of morphine is ½, grain of morphine sulfate for the average adult.

The incidence of malignant disease in the larynx is now a well known fact. Today everyone is on the alert for malignancy of the larynx when a patient past 40 presents himself with a chief complaint of boarseness. This is of special importance to both the patient and the laryngologist because intrinsic laryngeal cancer in its early stage is now curable in about 80 per cent of the cases.

The esophagus has not received the attention of the clinician as much as other organs in the body Perhaps the indefinite subjective sensa tions complained of are usually considered as bysteric or neurotic These patients are usually referred from one physician to another or from one clime to another with a loss of time that allows pathology to increase. When the dysphagm has become complete, then, and then only, would the patient receive conscientious attention. All diseases of the esophagus manifest themselves, sometimes early, in difficulty in swallowing-dysphagia Before this, bowever, there are complaints of indefinite sensations in the neck and these more often cannot be localized. Just such patients should be thoroughly examined by means of esophagoscopy and orcame disease be ruled out.

In the newborn, the occurrence of choking attacks and cyanosis when fluids are taken should suggest atream of the esophagus. Esophagos only is indicated in all conditions of esophageal disease requiring corroboration of the roentgen findings. It is also indicated in those patients with esophageal symptoms in whom there is reasonable belief that disease of the esophagus exists in the presence of roentgen findings.

Patients having a series of endoscopic treatments are generally not given any premedication after the first few times, especially if treated as

Read at the January 1945 Clinical Meeting of the Jewish Memorial Hospital, New York City

outpatients In this connection it is well to mention the "sermon on relaxation" which Dr Chevalier Jackson feels is perhaps more efficacious if not more important than a drug

For direct laryngoscopy and bronchoscopy in adults a 10 per cent cocaine hydrochloride solution is applied in both pyriform spaces Following this, 2 ec of a similar solution is instilled in the larynx by means of the Lukens syringe Subsequent anesthesia during the procedure can be applied by means of spray

For esophagoscopy in adults, a simple spray of a 10 per cent cocaine hydrochloride solution is used in the pharynx The patient is asked to gargle with the excess and then to expectorate it

In children under eight no anesthetic is, as a At this point, teamwork is perhaps of the greatest importance

#### Case Reports

Case 1 — P H, a woman aged 40, was admitted to the City Hospital July 10, 1943, and discharged September 15, 1943 On admission the chief complaints were hoarseness for the past seven months and a cough One year prior to her present illness she had a severe "cold," which was associated with The cough lasted three months and was followed by hoarseness wluch has persisted and has progressively increased

Several weeks before admission to the hospital her cough reappeared This had occasionally been accompanied by homoptysis The patient lost 10

pounds in neight

Examination on July 15, 1943, of the larynx by indirect mirror method revealed a large cushionlike ovoid tumor involving the interarytenoid area and extending down the posterior wall of the laryny By direct laryngoscopy on this date the tumor mass was removed en masse and the specimen sent to the laboratory for pathologic examination

X-ray taken on July 15, 1943, showed moderate dilatation of the ascending aorta and aortic arch There was accentuation of the pulmonary markings. especially in the right upper lobe, with a suggestion of localized infiltration in the subclavian region

On July 23, 1943, the pathologie report on the specimen removed from the laryny was "The epithelium is preserved. The superficial layers are edematous and infiltrated with polymorphonuclear leukocytes The deep layers also are edematous and infiltrated and have some macronuclei and In the underlying layer is extreme engorgement and diffuse mixed-cell reaction In the deep layer are some small focal areas of epithelioid cells, and a rare early grant cell and diffuse mild infiltration with polymorphonuclear cells The surrounding zones are heavily packed with lymphocytes

Diagnosis Chronic tuberculosis of the larynx On September 13, 1943, the sputum examination was reported positive for tubercle bacillus

Summary The case clearly illustrates the presence of an extensive tuberculosis of the larynx asso-

ciated with a lung lesion diagnosed by laryngoscopy

Case 2 -E P, a woman aged 50, was admitted to the City Hospital on March 2, 1943, and discharged August 11, 1943

On admission her complaints of three months' duration were weakness, anorexia, cough, backache, and fever

Examination of her chest revealed sibilant and sonorous rales in both lungs

For the next ten days she ran a subclinical temperature and expectorated a moderate amount of greenish sputum At no time was there any hemop-At this time the left side of the chest revealed moist rales from the clavicle to the fifth nb anteriorly, as well as in the axilla. There was diminished breathing and duliness posteriorly, but no rales

From x-rays taken on March 4, 1943, the report "Left lung—there is extensive mottling with irregular poorly defined confluent densities present from apex to base The heart is obscured by abnormal densities The right lung shows no cvidence of any gross changes"

Conclusions In view of the unilateral involvement of the left lung the possibility of a nontuberculous lesion must be considered Bronchoscopy is advisable for further information

On April 7, 1943, the sputum was positive for On June 10, 1943, a number 8 scope was passed. The traches tuberele bacıllı Jackson bronchoscope was passed and right bronchus appeared normal The mucous membrane of the left bronchus was congested and ırregular A biopsy was taken at a level just below the carma

The pathologic report on the bronchus biopsy "Specimen consists of a mass of granulation tissue with large component of monocytic cells and several grant cells

Diagnosis Chronic tuberculosis of the bronchus Summary A prolonged temperature, cough, and an x-ray report of a unilateral extensive lesion with a positive sputum still presented a problem spite of the x-ray findings, the roentgenologist requested a bronchoscopy Apparently his findings did not seem quite clear even though the sputum was positive Bronchoscopy with the visualization of the processes helped to clear up the diagnosis

Case 3 -W S, a man aged 67, colored, was admitted to the City Hospital April 2, 1943, with the following complaints cough, loss of considerable weight, and weakness of four weeks' duration gave no history of tuberculosis, diabetes, or kidney or heart disease During childhood lie lost an eye through an accident

During his stay in the hospital his temperature fluotuated between 98 and 102 F X-ray examination showed marked cavernous lesions of the right upper lobe and apex. A Wassermann test proved negative A sputum sample was sent to the laboratory but a report was not noted on the chart.

Chinically the case appeared to be one of bronchogenic carcinoma with secondary destruction and infection. Bronchoscopy was performed on April The findings were 8, 1943 the right main bronchus was normal except for a large national of mucopurulent discharge. The left bronchus was normal A smear taken from the right bronchus revealed tuberele bacilli. On April 18, 1943 the patient expired and postmortem examination revealed extensive pulmonary tuberculesis of the right lung.

Summary Here again one would rather lean toward a diagnosis of malignancy than tuberculous because of the age of the patient, no history of tuberculous and the x ray findings. Smear from the concentrated secretion from the bronchus will frequently give a positive sputum for the tubercle bacillus when an ordinary sputum will prove negative.

Case 4—H P, a man aged 65, was admitted to the City Hospital on November 20 1943, and discharged December 27, 1943 On admission the chief complaints were weakness, loss of weight, generalized pains throughout the entire body, and severo headachies.

His appetito had been fair, he denied use of alcohol and presence of any veneral disease. He

coughed occasionally

Physical examination revealed a white eldering man, filrly well neurabled but pale. His lungs showed no dullness but scattered rales were present throughout. The opegrounds on examination revealed bilateral papillederna. An x ray taken on Avamber 30, 1943, showed a triangular shadow in the region of the right hilum. Poorly defined, partly confluent round densities were scattered throughout both lungs, especially in the lower lobes. A cal cified gland was present at the left hilus. On December 3 1943, a bronchoscopy was performed. The larynx appeared normal except for some congestion of the mucous membrane. The trachea was displaced slightly to the right. The mucous membrane of the right main bronchus was congested. A hippey was taken from the right bronchus.

A report hy the pathologic department, subsequently returned was "Primary carcinoma of the bronchus.

monenus.

Summary. The bronchoscope here also helped to make a clinical as well as a pathologic diagnosis. Case  $\delta$ —J. R., a man aged 64 was admitted to the City Hospital August 10 1944, and released

himself Sentember 10, 1944

On admission the chief complaint was a choking sensation in the neck. There was no loss of weight. On August 16 1944, the x-ray report of the esophagus was "There is marked curving of the esophagus, especially in the region of the aortic arch. A diverticulum is noted in the region of the sorte arch."

Esophagoscopy was performed on September 6 1944 with the following findings a large saucer shaped pouch was seen on the poeterior wall of the coophagus about 2 cm. below the cricopharyngeal orifice. There were no ulcerations present The diverticulum was firm and fixed The mouth of the diverticulum was large and open The fundus was shallow and not capable of retaining much residue. The coophagus below this was normal

Summary It is in such a case as this that esophagoscopy is essential in order to study the nature and configuration of the diverticulum, and primarily to determine the future course of treatment. Case  $\theta \sim J$  M, a man agod 77, was admitted to the City Hospital on August 2, 1943 The chief

complaints were vemiting after meals for the past few weeks and difficulty in swallowing

\tag atudes taken August 3, 1943, showed
"There is a marked filling defect of the lower half of
the esophagus extending from the area of the bi
furcation downward Tho upper part of the

ecophagus is dilated"

Diagnosis Obstructive leanon of the midportion of the ecophagus most likely on a neoplastic basis,

On August 19, 1943, under 10 per cent cocaine hydrochloride local anesthesia, the esophagoscope was passed. The upper portion of the esophagus was markedly dilated, approximately four times tho normal lumen. At a distance of 44 cm from the anterior incisors there was found a dark red brittle mass involving the entire esophageal wall. A biopsy was taken from this mass.

On August 20, 1943, the pathologic report on the hiopsy from the esophagus was "There is a marked downgrowth of the rete pegs and the cells vary moderately in size and ahape of the nuclei with a tendency to hyperchromatism. The underlying atroma is heavily inflitrated with lymphoid plasma at the pathologic lesson in the esophagus was so advanced as to be beyond surgical help. A gastrostomy was performed on September 14, 1943. On September 22, 1943, the patient expired from bronchonneumonia.

Summary Peroral endoscopy definitely helped to make a diagnosis and assist the surgeon in deending what further course of treatment be instituted

----

#### Conclusions

In this comprehensive paper the author has uttempted to show the following points. First. peroral endoscopy in the hands of a competent physician can prove to be an able adjuvant and very frequently the only definite method of making a real pathologic diagnosis Second, the surgeon depends greatly on the opinion of the endoscopist for help as to the extent of involvement of a lesion, whether it be in the lung or esophagus, so he may decide just what procedure he must pursue in order to get the patient well Third, to the chincian peroral endoscopy is of great help, particularly in questionable diagnosis or variable roentgen reports. Fourth, typical clinical material is described to illustrate endoscopy as a clinical aid in (1) tuberculous of the larynx associated with tuberculous of the lung, (2) pulmonary tuberculous with pneumothorax, bronchoscopy utilized to rule out carcinoma-(3) pulmonary tuberculosis, diagnosed by hronchoscopy, (4) bronchogenic carcinoma, (5) esophageal diverticulum, and (6) carcinoma of the esophagus.

### LONGEVITY BECOMING COMMON

Longevity is a state desired by virtually everyone for the individuals are few who can view the possibility of their own death with equanimity several generations ago the number of persons reaching the moderately advanced age of 70 were comparatively few and, worse still, the newborn baby's chances of reaching adulthood were not too good. The high infant mortality of those days made the average age at death very low. Then medical science and greatly improved pediatric care began to save our babies, which materially increased the average mortality age, but still men and women were not reaching advanced age as often as they should.

Now the situation is changing. Not only is the average mortality age creeping steadily higher, if we exclude war deaths, but the actual number of men and women who reach 70 and above is increasing markedly. In 1942 we reached a peak year of longevity for the American people and the Statistical Bulletin of the Metropohtan Life Insurance Company has noted it in the following article.

The average length of life of the American people in 1942, corresponding to the mortality conditions then current, was 64 82 years, the highest on record to date. This new figure represents a gain of more than 15½ years since the beginning of the century, when the average length of life was only 49½ years.

In the white population, the average length of life of males increased by 15½ years since 1900, while the gain for females was somewhat greaternamely, 17½ years. Even at age 40 the average after-lifetime increased by 2½ years for white males and 4½ for white females. Among colored persons, too, the advance in average length of life was very appreciable, being 21¾ years for males and 23 years for females. However, there is still substantial room for improvement in this group of our population, for their average length of life in 1942—namely, 54¼ years for males and 58 years for females—was about the level of that for white persons more than two decades earlier. As compared with white persons in 1942, colored persons of each sex had an average length of life shorter by about ten persons.

Because of the high mortality in the first year of life, children who have attained one year of age have an even greater expectation of life than newborn babies

Thus the average for white and colored of

both seves, combined, at age one year in 1942, was 66 65 years, almost two years more than at birth In particular, white girl babies celebrating their first birthday have, on an average, 70 years of his before them. This means that the average age a death for these babies will be 71 years, exceeding the proverbial three score and ten. In fact, according to modern mortality conditions, the average age of death for all white females, once they have passed their first birthday anniversary, is greater than 70 years. Among white males, the average age at death will be greater than 70 only for those who have reached their 40th birthday.

A very large proportion of the persons now at work will live to the usual retirement age. Thus, age 65 will be attained by more than two-thirds of the persons now between 25 and 35, by almost three-quarters of those now 45, and by four-fifths of persons 55 years old. The number of years remaining after 65 is quite appreciable, for the average person it is 13 12 years, while for those in a state of health better than average the outlook is even more favorable.

White females in the first year of life had the exceptionally low death rate of 33 79 pcr 1,000 births, the corresponding figure for white males being 42 99. The rates for the colored were about 75 per cent greater than for the white in the case of females, and 66 per cent greater for males. For each race and sex group the mortality rates in the first year of life were down to less than one-third what they were at the beginning of the century.

Exceptionally low mortality rates, less than one per 1,000, were experienced by white males at each year of age from 7 to 12, by white females from 5 to 17, and by colored females from 8 to 10

Evidence at hand indicates that the record for American longevity established in 1942 was not equalled in 1943, and probably will not be in 1944. The advantages of our high standards of living and of medical care were still available to the general population in the first year of war. However, as the conflict wears on, there are increasing demands upon the civilian economy and upon the personnel devoted to the care of its health. It is to be expected that living and working under wartime conditions exacts its toll on the home front. Nevertheless, the current health and mortality levels are favorable.—

M. World, Oct., 1944.

## PLASTIC SURGERY UPON THE AXILLA IN CERTAIN CASES OF PERSISTENT BROMIDROSIS

KEITH KAHN, M D, New York City

"HE problem of hromidrosis, or "body odor," L due to fetid or offensive perspiration, while important from a social and esthetic viewpoint. has never received the attention that it deserves. Owing to the crowded living and working conditions brought on hy the war, this problem has recently become more than usually prominent It is the purpose of this article to direct serious attention toward the scientific correction of this annoying coodition hy means of the utilisation of plastic surgery The senes of cases observed hy the writer wherein plastic surgery was employed was confined to those patients among whom the hody odor from the axillary region was persistent and offensive and failed to respond to ordinary hygieme measures such as water, perfumed and antiseptle scaps, decodorants, and antisudorifics (astringents used locally whose main active ingredient is usually aluminum chloride)

In the present group, cases only of axillary involvement were considered because such cases are the most injurious to the economic and social life of the patient, and also because this group seemed to be the most amenable to surgical treatment. The milder body odors from the neasmouth, feet, vagina, propues, and in the skin—from the female patients during the period of menstruction—are excluded because they usually, to a greater or lesser degree, respond to normal hydraine measures.

Eller, in discussing body odor, states that normally the body has an odor which depends upon inherent factors in the individual and his race. In addition, certain extraneous factors such as migestion of foods and medicaments may, by physiologic action in the body, impart an odor to the hreath and to the normal secretions of the skin. Other incidental extraneous factors which may give an odor to the body are uncleanliness, poor mouth hygiene, and occupational and other cootacts. We are concerned only with the body odor caused by milodorous axillary perspiration

It has become generally recognized that the axillary odor in hromorous is due to the secretion from a special type of sweat gland known as the apocrine type. The ordinary sweat glands are classified under the heading "ecerine." The apocrine type of gland was first described in 1846 by Horner, who mentioned that these glands are especially noticeable in the Negro, although not peculiar to that race. Von Kollika\* remarked that these glands secrets protein and fat and more

nearly resemble the sebaceous than the sweat glands.

More recently (1922), Schifferdecker4 reemphasized the fact that the sudomparous glands should be divided into the apocrine, or "A," and eccrine, or "B," glands, which may be differentiated by size, development, location, and scoretory activity Way and Memmesheimer regard the apocrine glands as having secondary sex characteristics and stress the fact that they are absent before puberty and atrophy in old age Rahaudi\* found them enlarged in pregnancy and Locsche<sup>†</sup> during menstruction Other writers claim an increased activity during organi-Sutton's states that human beings as well as other animals are odorous io association with sexual stimulation

The appearing glands are found only in certain areas—the axillary region, aredia of the nipples, and the genital and pengenital, perianal, and sometimes abdominal regions.

#### Anatomy of the Sweat Glands

The sweat glands, coil glands, or glandulue sudomicrae, are modified tubular glands occurring in the integument upon all parts of the body except the margin of the lips, the glans, and inner surface of the penis (Sutton) According to Krause, they are most numerous upon the palms and soles, where he found 2,700 to the square inch He counted some 1.300 in like areas of the forehead and neck and 550 on the cheeks Their total number is said to exceed 2,000,000 authorities obtained a different count in definite areas, one giving the axillary count as 400 to 600 per sq cm in women and 500 to 800 in men. As a square inch consists of 10 45 sq. cm., this couot would have to be multiplied by the factor 10 45. giving an axillary count of approximately double the count previously noted for the palms and moles

Anatomically, there are two distinct divisions in these glands a body and an excretory duct. The body, which varies somewhat in size, is globular or flattened and consists of the complicated windings of a single, or rarely, a branched tube having a fairly uniform caliber. The secreting or glandular portion of the tubule is of somewhat larger diameter than the duct and is made up of a single row of rather flat columnar epithelial cells with granular cytoplasm and spherical nuclei. The bases of the secreting cells

rest upon a thin but compact layer of involuntary muscle, the spindle-shaped elements of which are arranged longitudinally Surrounding this layer is the membrana propria, which is supported by an external sheath of dense fibrous and elastic tissue

The glandular portion of the sweat coil is surrounded by a dense vascular network and supplied by nerves consisting of nonmedullated sympathetic fibers forming a plexus upon the membrana propria and supplying the secreting cells and muscle elements The duct has a smaller diameter than the secreting portion and It is lined with is little more than a tube ordinary pavement epithelium arranged in two rows upon a membrana propria resting upon a thick connective-tissue layer. There are no The duct runs upwards through muscular fibers the corrum in a spiral or undulating course, reaching the rete usually at some point between the papillae, where it loses the connective tissue sheath and is surrounded by prickle cells the stratum granulosum it resumes the spirilliform course, opening upon the surface by means of a rounded funnel-shaped aperture

The apocrine glands, modified sweat glands, are said to be twice as numerous in women as in men (Sutton)<sup>8</sup> and differ in their secretion from the ordinary sweat glands. They, together with the sebaceous glands and the hair follicles, are developed from already differentiated epithelium, while the eccrine glands develop from undifferentiated epithelium. The apocrine glands are found only where hair exists or has existed. They differ from other glands of the skin in that they are of reddish tint instead of yellow and extend more deeply, being found within the subcutaneous tissue.

The cells making up these glands are characterized by their great volume and manner of grouping, being united in groups which give a pitted appearance to cross sections of the axillary skin. Their size renders them easily visible to the naked eye (Way and Memmesheimer) <sup>5</sup>

### Pathology of Bromidrosis

According to Sutton, sweat secretion of an offensive odor may be due to functional disturbances or to alteration of the sweat after its excretion. The disorder may be general or local and is usually associated with hyperidrosis. The condition may be symptomatic or idiopathic, it may be due to sudoral excretion of urea Many localized forms of bromidrosis, he claims, are due to decomposition of perspiration after excretion or contamination with Bacillus fecalis. It is probable, he states, that chemical decomposition of the excreted fluid plays an important part, for the odor is most marked when sweat is not

allowed to evaporate promptly He agrees with the generally accepted opinion that odorosity of perspiration is largely due to the apocrine glands and that persons differ with regard to the general development and function of the apocrine apparatus, the odors being of variable strength as well as varying in one person at different times

Sulzberger and Wolf<sup>10</sup> maintain a similar view-point, stating that in bromidrosis the characteristic changes may be due to intrinsic factors as well as the action of micro-organisms (Leptothrix and other fungi) They add that in bromidrosis increases in the quantity of odoriferous substances normally secreted by the apocrine glands undoubtedly play a considerable role

Drake<sup>11</sup> states that the apocrine glands contain fatty substances which are or may become odoriferous due to the release of the lower carbon group of fatty acids such as caproic and caprylic (Others add butyric)

Marchiomm<sup>12</sup> as well as Levin and Silvers<sup>13</sup> have shown that a considerable difference exists between the chemical composition of the eccrine and apocrine perspiration. The former had a pH of 3 8 to 5 6 and the latter from 6 2 to 6 9 in the cases that they had observed

My own observations have lead to the conclusion that the offensive odor of the avillary sweat secretion may be due either to the alteration of the sweat after its excretion or to some functional disturbances of the gland itself which permits excretion of products usually eliminated through other channels. The possible influence of infections of the teeth and gums upon this condition was left to those doing dental research Likewise, the hypothesis of infection of the tonsils and sinuses being contributing factors was not seriously considered

It is the author's opinion that abnormally rapid chemical decomposition of the excreted perspiration is not an important factor in this condition, either where evaporation takes place very slowly or where B fetidum is present

In brief, the following observations have been made

- 1 It seems that the most logical theory is that the axillary sweat glands in certain individuals are in some manner persuaded to perform certain liver functions. The sebaceous glands do not seem to play any part therein nor to influence the condition
- 2 Persistent axillary body odors are far more noticeable and more pungent in the darker than in the lighter races. This is particularly true in Negroes, Syrians, and Armenians. However, this is not true of some of the Asiatic races, which seemingly have fewer sweat glands—this fact being particularly applicable to the Chinese and Japanese. Prevalence of this condition seems

to be about equally distributed between blondes and brunottes among the average American patients

3 Persistent body odor seems to be a condition and not a disease. This is evidenced by the fact that laboratory findings involving analyses of the blood and urine do not show any upprecuablo physiologic variations nor biologic changes

Persistent axillary odor appears to be a localised condition confined to the axillary sweat glands (or possibly the axillary appearing glands) because such patients may be entirely devoid of body odor from aweat glands in other regions of the body

The similarity of axillary body odors is noticeable among members of the same family However, thus is not as true in persistent cases as in milder cases which may be detected as evi-

dences of lack of normal cleanliness

The average offensive axillary body odor which persists regardless of hymenic measures is accentuated and becomes decidedly nausenting nfter intercourse, I e., only nfter the patient has completed an organi

In the series of cases under consideration, only one has been n case of hyperidrosis and that

was a possibly tuberculous patient.

The numberty of patients have been women among whom the number of sweat glands per

so cm has been below the average In one patient, the odor was so offensive that n dress worn five minutes by the patient and then hung up in a well-ventilated room still strongly retained the steach after twenty-four The patient had shaved the arm pits and had a bath an hour before wearing the gar-A complete examination, including laboratory work, was negative

Certain foods and drugs may alter the odor of the perspiration but not to nny appreciable degree (However, this does not hold

true in normal perspiration )

Nervous reactions and drugs which increased the amount of perspiration and thereby diluted its constituents, instead of helping matters, seemed to make the odor worse

The majority of the patients under observation were underweight and only one patient

was found to be decidedly overweight In one patient, a female, exceptionally

clean about her habits and person, the offensive odor was ascertained to be easily detectable over an entire office in which seventy-five other persons were employed

In the colored race, the frequency of this condition may run as high as 40 per cent, depending to some extent upon the climate. On the other hand, among average white patients the frequency varies between 6 and 10 per cent

### Plastic Surgical Operation for Bromidrosis

Inasmuch as all conservative treatment for marked cases of bromidrosis have been a failure and leasmuch as patients afflicted with this disorder suffer social and economic impairments due to this offensive condition, the writer has devised and carried out a plastic surgical resection of the larger axillary sweat glands with gratifying results

Hitherto, the hairy region of the axilla has determined the operative area but recently a more scientific approach has been given consideration That is, nfter shaving the axilla, the patient is given a small dose of potassium lodide (5-10 grains) Following this, the armpits are In five to fifteen minutes. dusted with starch free roding appears in the perspiration to form a blue discoloration The dark-colored area is then outlined on the skin with some dye or stain This area varies in shape among individuals and in the two sexes The prea in men is more in clined to be oblong, and in women, oval. The more limited the nrea, the greater the chance for complete relief, the more diffuse the glands, the more limited the result, for in these cases complete removal of the glands cannot be attained

After having determined the distribution of the axillary sweat glands, it is important to decide upon the method of closure of the operative wound as well as to determine whether it is ndvisable to excise the entire gland-bearing area Two factors must be borne in mind in this preoperative plan It must be possible to close the incision with a sliding akin graft, and this must be done without contracture or deformity of the axillary tissues If the gland bearing area is too diffuse to be excised without deformity, then it is advisable to recognize the operative limitations and remove only as many of the most netive

glands as is possible.

A general nnesthetic is preferable to a local in these cases, because sterilization of this area is difficult and even the mildest infections in the nrea cause extreme discomfort and inconvenience The anesthetic should be preceded by any of the recognized methods omployed to facilitate nneethesia

Any of the accepted methods of asersus and antisepsis used in the various hospitals may be employed Iodine and alcohol, however, seems to be a combination especially adapted to sterilization of the operative field in these regions. The iodine should be swabbed on freely and after it is dry it should be thoroughly removed with lodosla

The operation is begun by an incision previously planned as to scope, shape, and extent, so that it will permit wide and blunt dissection, The affected sweat glands are freed and excised

Care must be taken not to injure any of the many important structures of the axillary fossae, but all the gland-bearing subcutaneous tissue should be removed in order to eliminate the possibility of cystic changes The skin is then freed on all sides, still using blunt dissection in order to permit a precise employment of the "plastic closure pattern" preoperatively agreed upon rupted sutures of nonabsorbable material should be used, heavier material for tension wherever necessary and fine material where there is little or no tension

Subcuticular and mattress sutures contraindicated for closure in this operation because of the constriction and pressure that might separate the coiled portion of some of the sweat glands from their ducts, and thus induce Blunt dissection alone is also cystic formation used in this operation in order to eliminate the possibility of isolating any of the coiled portions of The closed incisions are the sweat glands covered with medium-sized pads wet with 70 per cent alcohol These pads are then covered with a dry dressing which is held in place by means of adhesive strips around the dressing and arm just below the shoulder and other strips traversing the armpits and shoulder The first change of dressing occurs on the fourth or fifth day and subsequent changes are made every other day or every third day until healing is complete small sutures are removed on the eighth to tenth day and the retention sutures on the tenth day

Healing in the avillary regions is usually slow If the entire gland-bearing area is removed, there is little need for postoperative care and treatment, but if only partial excision is performed then the surgeon must depend upon extensive undermining of the sliding skin graft to reduce the activity of the outlying sweat glands because of the surgical interference with their blood supply To diminish the activity of these glands further, it may be advisable to resort to very light dosages of x-ray These exposures should be extremely mild and a specialist should be ever mindful of the serious consequences resulting from x-ray burns in these regions use of the electric needle for the attempted destruction of any remaining offensive glands is contraindicated on account of the tortuous course of the glandular ducts Radium should be used to combat any keloidal tendency which may not be indicated preoperatively

In very severe cases in which total excision of the axillary glands cannot be accomplished by using a slide graft, a free skin graft may be As yet the author's experience has been limited to the use of the sliding graft Free grafts do not take well in the axilla, and pedicle grafts leave extensive scars

In conclusion, it is the opinion of the author that this plastic surgical procedure is a means of escape from social quarantine and economic isolation for a certain group of severely handicapped individuals In patients on whom total excision can be done, the affecting condition may be almost entirely relieved. In cases in which only partial excision is accomplished, the result may be considered satisfactory, especially if the surgical treatment is supplemented by x-ray and hygienic In the most diffuse cases in medicaments which the prognosis preoperatively was considered poor, the improvement was sufficient to justify surgical treatment

### POSTWAR MEDICAL AND SOCIAL PROBLEM

Men returning from combat areas who have been unfortunate enough to contract tuberculosis will not take kindly to hospitalization and other restrictions when their ambition for years has been a return to normal living To provide proper treat-

ment for these men as well as protection for their families will be one of the difficult medical and social problems facing those responsible for tubercu-losis control—A J Chesley, M D, and D A Duke-low, M.D, Minn Dept of Health

### 1,500 CONSECUTIVE DELIVERIES OF VIABLE BABIES AT THE NORTH COUNTRY COMMUNITY HOSPITAL

ROBERT S MILLEN, M.D., Westbury, New York

(From the North Country Community Hospital)

S THE postwar period will undoubtedly A see the huilding of many hospitals and addi tions to present hospitals, it seems advisable at this time to make numerous hrief statistical studies in various types and sixes of hospitals to help in the postwar planning

For this purpose I am presenting a resume of 1.500 consecutive deliveries of viable babies at the North Country Community Hospital, from

August, 1941, to December 15, 1943

The North Country Community Hospital, located in Glen Cove, New York, is a general hospital of one hundred beds and twenty-five bassinets, with an attending staff of fifty nine, a courtesy staff of thirty-two, and a consulting staff of thirty-one physicians The obstetne section consists of five private, four two-bed semiprivate, two four-bed semi private rooms, and an eightbed ward service. There are two labor rooms, two delivery rooms, a large nursery with its subdivisions, and a premature nursery with three Davidsen incubators The operating-room suite is one floor above the delivery room, and therefore very accessible. Anesthesia is given by three nurse ancethotists, one of whom is always on duty The type of analgems used varies with the different men. While a combination of barhiturates, scopolamine, and rectal ether seems to be the type most commonly employed, an analgema of morphine with ecopolamine has been given in a small percentage of cases. A few patients, particularly with premature births, have been delivered with spinal or caudal anesthesia or pudendal block. A rule requiring a consultation on all major obstetric procedures and patients in labor over twenty-four hours is racidly enforced

Fifteen hundred consecutive obstetric cases were studied and are shown in Table 1, in which they have been separated into primiparae and multiparae and subdivided as to the weeks' duration of the pregnancy, the type of delivery, and the outcome as regards mother and baby were no maternal deaths and only twenty-eight fetal deaths

One baby survived of the 6 patients delivered between twenty-four and twenty-eight weeks. gestation. The patients whose pregnancy was between twenty-eight and thirty-two weeks resulted in a survival of five of the nine babies delivered Only one baby was lost out of the thirteen delivered after between thirty-two and

thirty-six weeks' gestation Several factors have helped to get the good results obtained with premature infants, namely, an adequate supply of Davidsen meubators, a special premature nursery that is on the main corridor and constantly passed by nurses, the frequent inspection of the incubators, the outer room for changing the oxygen tanks, etc., and a proper spirit on the part of the nursing staff They have been shown that good results can be obtained among prematurely born infants premature infants are fed by gavage after a fasting period of twenty-four hours. All care is given through the portholes of the incubators

The majority of cases, naturally, fell in the group of patients whose pregnancy lasted over thirty-six weeks. In this section of the chart, as with the previous one, the cases of pre-eclampsla, colampsia, and twins, also having been counted under the type of delivery, are not amin

counted in the grand total

The type of delivery used for toxemic patients is shown only for the eclamptic and severe preeclamptic cases in order to avoid a misrepresentatation It was impossible, from some of the histories, to ascertain whether a patient should be considered mildly pre-eclamptic or not. One prunipara, admitted to the Hospital with severe toxemia and convulsions, was delivered by cesarean section at thirty-two to thirty-mx weeks Both mother and baby did well. One toxemic primipara who was delivered by cesarean section and developed convulsions postpartum was in the thirty-eax plus-weeks' duration group Two primiparas with severe pre-eclampsia in this same duration group were delivered by Two multiparas with marked precesarean eclampata were also delivered by cesarcan. It is interesting to note that of 3 patients near term with convulsions, and one between thirty-two and thirty-six weeks, all mothers survived and only one baby was lost, and that one was delivered spontaneously Another stillbirth was associated with a spontaneous delivery of a pre-eclamptic patient.

The highly satisfactory results with primiparous breech cases at term may be due to the fact that no baby was over 8 pounds. Two weighed between 7 pounds, 9 ounces and 7 pounds, 11 ounces, and 3 between 7 pounds, 6 ounces and pounds, 9 ounces. Most of the babies in breech presentation were extracted after the

<sup>\*</sup> Not counted in grand total as these cases are also counted under type of delivery Cesarean incidence—2 6 per cent. No maternal mortality

presenting part had protruded through the vagina

The increased fetal mortality through midforceps is shown by the four fetal deaths in the twenty-eight primiparas so delivered. The increased fetal mortality and maternal morbidity from version extractions are likewise indicated.

Of the twenty-five morbid cases, the reason for the morbidity arose from the uterus in 17 cases, from the breast in 5, from the upper respiratory tract in 2, and from urmary causes in one A temperature greater than 100 6 F on two successive days was taken as an indication of morbidity. The cesarean sections are not classified as morbid, due to the fact that nearly all of them had a slight operative fever, as expected

intestinal obstruction. The premature bahy lived fourteen hours

In the thirty-two to thirty-six week group there was one classic and one low-flap cecarean for placenta previa and one classic cesarcan for toxemia

There was a definite increase in the group of patients whose pregnancy was over thirty-six weeks' duration, as indicated on the chart. In this group there was one extraperitoneal section upon a multipara whose previous pregnancy had been twenty years before. It was felt by her

obstetrician and the consultant, since she had delivered previously and that her labor was of a poor character, that with rest and sedation and. if necessary, some stimulation, she might again deliver spontaneously However, when she had been in labor for forty-two hours with ruptured membranes for thirty-six hours and was febrile for at least twelve hours, without making any definite progress, it was deemed advisable to do an extraperitoneal cesarean. The indication for one was psychosis. Sterilisation was performed at the same time. It can be seen that some physicians still prefer to do the classic type of cesarean section, in spite of labors of twenty-four hours or more However, these patients were not februle and the membranes were intact.

Table 4 shows the types of delivery utilized to handle persistent posterior positions

The patients who had serious bleeding and questionable diagnoses are handled by x ray studies and by pelvic examination in the operating room, which is set up to proceed with a cesarean if that is indicated

#### PENICILLIN

With the appearance of penicillin on the general civilian market, it will doubtless be widely proscribed for the many infections which it benefits Among its extensive fields may be the veneral discases.

It is remarkably active against the gonoconand apparently also against the spirocheto of early, secondary, and late syphilus, as well as in congenital syphilis and syphilus of pregnancy. A timely article by Blake 1 of New Haven differentiates the activities of the sulfonamides and ponicillin.

The sulfonamides are of value but not penicillin, he says against such infections as those of the colon bacillus, dysentery Homophilus influenzac, Friedlander's bacillus, and Ducrey's bacillus. In syphilis, yaws, and possibly other spirochetal infections and gas gangrene, penicillin is of value but not the sulfonamides. In conditions where both

1 Blake Francis G J.A.M.A. 127: 517 (March 5) 1948.

substances are more or less effective, as agunst the pneumococcus, streptococcus, memngococcus, and gonococcus he feels that the greater case of ad gonococcus he feels that the greater case of ad ministration of the sulfonamides will keep them in the lead. They, of course, may be administered hy mouth while penicillin must be injected at usually throc-hour intervals making any prolonged main tenance of high blood concentration of penicillin somewhat inconvenient. Biske considers penicillin more effective in many staphylococus infections.

More recently Gyorgy<sup>1</sup> and associates have announced that penicillin may be administered by mouth with a buffer sait (trisodium citrato) to prevent its destruction by the acid of the stemach. The effective desage was comparable to those used parenterally

### ELECTROSHOCK THERAPY IN PREGNANT MENTAL PATIENTS

PHILLIP POLATIN, M D, and PAUL HOCH, M D, New York City

(From the Department of Psychiatry, the New York State Psychiatric Institute and Hospital)

electric shock therapy, it nevertheless has found wide application. Comparatively few ill effects have followed its use and the mortality rate is very low. It has been applied to aged individuals and to those suffering from marked hypertension and cardiovascular disturbances. Other complicating organic disturbances have not been deterring factors in the use of electroshock. The question occasionally arises, however, as to whether electroshock can be given to psychiatric patients who are pregnant. We have seen no reports in the literature to answer this question.

Recently we have had the occasion to treat two pregnant psychiatric patients with electroshock therapy. One was three and a half months pregnant and the other seven months when electroshock was initiated

### Case Reports

Case 1—P K, a 33-year-old married white woman, was admitted to the Psychiatric Institute with a diagnosis of manic-depressive psychosis, depressed type. There was a history of repeated attacks of depression beginning nine years prior to admission.

The patient's father was stern and quarrelsome, her mother ill-tempered and quarrelsome. The parents bickered often and the atmosphere at home was one of tension and animosity. A brother died in a mental hospital with a diagnosis of hebephrenic schizophrenia. Another brother required psychiatric care during a depressive episode.

The patient was an unwanted child At the age of 2 she had pneumonia accompanied by convulsions Enurement persisted until the age of 5 Menarche took place at the age of 12 The patient lived in considerable fear of her mother, who frequently spanked her She married at the age of 26, against the strong objections of her mother and sisters, and a month later became pregnant Labor was difficult and was terminated by a version and breech extraction. There was no unusual reaction following the pregnancy During the intervening years she had four depressive episodes, often attempting suicide

Her recent attack of depression occurred three months prior to admission, at which time she was two months pregnant. Physical examination revealed no gross pathology. Laboratory findings were within normal limits. A urine pregnancy test was positive on the Friedman modification. The patient would not cooperate for psychotherapy, insisting upon electric shock therapy. The possible dangers to the fetus of this therapeutic procedure

were discussed with the patient and her family who, nevertheless, insisted on this form of treatment.

With the patient three and a half months pregnant, a course of electroshock therapy was insti-She had six treatments which resulted in five convulsions and two petit mal attacks refused further treatment. Now no longer depressed, she appeared cheerful, amuable, and optimistic as to the future and was said by the family to have returned to her premorbid level There were no complaints referrable to the pregnancy and no signs or symptoms of gestatory dis-She was now in her fourth month of preg-A month later she was discharged from the hospital and was considered as recovered followed in the antepartum clinic of Sloane Hospital and at term she was delivered of a boy baby weighing 3,270 Gm after a nine-hour labor. No abnormalities were detected in the infant and delivery The postpartum course was satiswas uneventful factory and the baby's progress in the hospital was normal

Case 2 -- A L, a 27-year-old married white woman, was admitted to the Psychiatric Institute with a diagnosis of psychoneurosis-conversion There was a large depressive component. hysteria The early years of the patient's life were marked by bitter quarreling between her parents because of her father's infidelity Later the mother took a The patient was aware of all this An older sister had ulcerative colitis and an older brother was single, unhappy, and given to outbursts of temper The patient, the youngest child in the family, stated that as far back as she remembers, she was much concerned with her appearance and often looked at herself in the mirror Menarche occurred at 12 and at the age of 15 she began going with boys, had many dates, and petted freely She completed high school and began working at 171/2 years of age as a typist She married at 21 Her husband was irresponsible, gambled considerably, and was constantly in debt. The patient was frigid in her sexual relations with him At the age of 25 she began an affair with another man who constantly praised her beauty and intelligence With him she experienced orgasm in coitus. She became extremely dependent upon him About eight months prior to the patient's admission, he abruptly left her Following this the patient became depressed and evidenced marked anxiety about a change in her facial appearance. She claimed that she looked older, her skin was coarser, and that she had fine wrinkles about her eyes She peered into the mirror many times daily to confirm this deterioration of her beauty Insomna became marked and she developed anorexia with weight loss

On admission she was found to be about five months pregnant. Physical examination revealed

Laboratory findings were no gross pathology within normal limits X-ray of her abdomen rovealed faint shadows of n fotal skoleton of approximately five months' gestation in cephalic presentation. For a period of two months following admission the patient was given psychotherapy with very little change. She continued to be depressed and complained often of her facial changes. When she was about seven months pregnant, a course of electroshock therapy was instituted. She had ten treatments which resulted in ten convulsions There was no particular change in her mental condition and no signs or symptoms to indicate any effect on the normal progress of her pregnancy. An nn alytic form of psychotherapy followed the electroshock and to this the patient responded fairly well. At term and with the onset of labor sho was transferred to Sloane Hospital. Here after n labor of twenty-one hours, she spontaneously dolivered a live, normal male infant weighing 3,470 Gm abnormalities were detected in the infant and delivery was uneventful. There were no unusual manifestations in the postpartum period and the progress of the baby was normal

#### Comment

It is an interesting phenomenon that olectroshock, which produces such marked muscular contractions in the strinted musculature of the extremities, has very little influence on the heart muscle or on the smooth musculature of the internal organs. The effect of the convulsion on the heart muscle is a surprisingly limited one, which explains why this treatment can be used even in people with some heart involvement. Morhid gastrointestinal manifestations in connection with electroshock are equally rare. Some nausea and occasional vomiting occur, especially

if the treatment is not administered on an empty stomach But usually there are no contractions in the stomach or bowels in any way comparable to the tonic-clonic manifestations in the etriated Incontinence of urine and fecca is also a rare occurrence, indicating that contraction of the ureter and bladder are, again, infrequent They are much less common in these artificially produced convulsions than in cases of epilepsy The uterus apparently behaves in the same way as the above-mentioned smooth muscle organs It does not contract during an electroconvulsion Abortion and premature birth are known to occur in some epileptics, but they are quite rare considering the large number of epileptics who are pregnant and give birth normally to children The circulation is seemingly very little affected in the pelvio organs during electroshock and for that reason the circulation of the child also remains unaffected Theoretically, it would seem possible that anoremia caused by the convulsion would affect the child with subsequent impairment in the nervous system, but apparently no anoxemia was observed in these infants and no manifestations of asphyxia could be seen after delivery

#### Summary and Conclusion

Two pregnant patients with mental illness were treated with electroconvulsive therapy. One was three and a half months pregnant and the other seven months. There was no miscarriage or premature labor and no ovidence of asphyxia of the ohildren. Electroshock does not seem to have any chincal effect on the smooth muscle of the uterus.

#### 'DISCOVERY" IN RESEARCH

The popular idea seems to be that an investigator sets out with the intention of making a particular discovery, such as a new element or a cure for a certain discoase but every scientific worker knows that real discovery, as distinct from invention, is never achieved in this way. A discovery is the process by which an idea of new relationships is revealed. The origin may be a chance observation which suggests a batherto unappreciated relation and leads to the formulation of a hypothesis which if possible, is then deliberately tested by experiment. The his-

tory of the discovery of insulin may be given as an illustration. The fundamental discovery here was

made by chance observation that removal of the

panereas produced diabetes, from that time on ward it was evident that if the missing panereatic function could be roplaced a oure would be possible and it was justifiable deliberately to search for some means of doing this. But the search was in valu until snother new idea came into physiology by reason of the discovery of autacoids. From this point on, all was clear in theory and it is no detraction from the merit of subsequent work to say that the final happy result depended principally upon inventive technic and manipulative skill and only in a leaser degree upon discovery. Discoveries are infrequent, and they mostly come out of the fullness of time.—

### UNUSUAL FOCAL INJURY TO SPINAL CORD

GRISWOLD D NAMMACK, M D, AND SIDNEY HIRSCH, M D, Far Rockaway, New York

(From the Surgical Service of St Joseph's Hospital)

AN UNUSUAL injury to a minute portion of the spinal cord prompts us to report this case. An icepick thrust at the level of the seventh thoracic vertebra in the right paravertebral region resulted in the involvement of only the fibers of the decussated spinothalamic tract with resultant somatic sensory loss.

### Case Report

A single, colored man of 21 years was admitted to St Joseph's Hospital on September 13, 1943

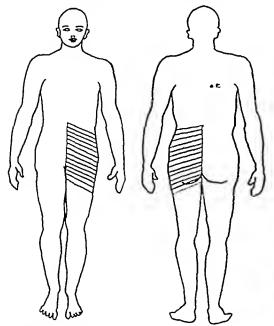

Fig 1 The shaded area indicates the complete loss of affective sensibility (pain and temperature), with retention of discriminative sensibility (tactile, loint, and vibratory sense) There was no involvement of any somatic motor component E shows the site at entry of the icepick

His history stated that he was stabbed in the back with an icepick during a free-for-all. He immediately complained of some numbness in the fingers of his left hand and a heaviness in his left leg with an inability to walk because of this heaviness. He had to be carried to the hospital

The abnormal sensations in his left fingers and left leg disappeared very quickly. About two and a half hours later his only complaint was of heaviness in his left lower abdomen and flank. Neurologic examination then revealed the dissociated type of disturbance in critical sensibilities with no motor disturbance.

X-ray of the lungs was negative X-ray of the dorsal spine for possible bony spicule was negative Lumbar puncture revealed no increased pressure and no gross blood. The chemistry of the spinal fluid showed 1 plus albumin and a faint trace of globulin. The cytology showed many red cells and an occasional polymorphonuclear leukocyte.

The patient was discharged on the eighth hospital day, his condition being the same

### Summary

Report of an unusual case of focal injury to a minute portion of the spinal cord (spinothalamic tract, decussated fibers) resulting in contralateral dissociated disturbance of critical sensibilities

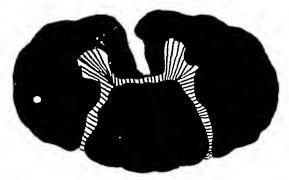

Fig 2 Cross section through seventh thoracic segment showing location of injury to spinal cord

# SULFONAMIDE-RESISTANT GONORRHEA IN PREGNANCY TREATED WITH PENICILLIN

BERNARD L CINBERG, M D, New York City (From the New York Polyclinic Hospital)

Mrs K. F, a 22-year-old nullipara, was first seen by me on November 6, 1943 Her last menstrual period had been April 22, 1943, and she was certain she was pregnant.

Physical examination revealed a healthy, young white woman with no constitutional defects. She was found to be six months' pregnant, the size of her uterus corresponding to the duration of her

A fetal heartbeat was audible in thu amenorrhea

left lower quadrant.

The solo ebnormal finding in her examination was the presence of an extremely profuse vaganal discharge It was greenish in color, foul smolling, and scemed to be typically Noisscrian in character Further questioning elicited the information that this discharge was first noted soon after the meep-tion of the pregnancy A cervical amear and culture were positive for the genococcus. The Wassermann was nemative

On November 16, 1943, she was given a course of 30 Gm. of sulfathiazole. She ingested 5 Gm of the sulfonamide and 10 Gm of sodium blearbonate daily for an days. The only untoward effect was moderate nausea during the first two days of medication. A cervical smear was found positive for the oisserian organism two days after the sulfonamide course had been completed A culture was not taken, since there was no chinical improvement.

A course of 30 Gm of sulfadiasine was started on November 23, 1943 It was given in the same manner as the sulfathingole but it was else clinically Ineffective. The discharge was unchanged in amount color and odor A smear taken on Noamount color and odor vember 20, 1943, was positive for the genococcus.

A third course of the sulfonamides was then given. The patient took 4 Gm. of sulfathlasole and one ounce of area daily for five days without any obvious improvement. A cervical amear taken on December 17 1943 was again positive

During this period of medication end observation the vaginal mucosa presented an unusual pleture. While the entire vaganal canal was diffusely inflamed, the anterior mucous membrane from the nuncocutaneous junction to the cervix projected forward into the vaginal canal, presenting e peculiarly roughened surface. The color was a hight red and is best characterized as "raspberry

Since the patient was nearing her expected date of confinement, it was deemed inadvaable to resort to hyperthornia treatments. We decided instead to employ penicillin in this unusual situation She was hospitalized on December 28, 1043, and a course of penicillin was given intramuscularly every four hours, day and night. Ton doses, each 15,000 Oxford units dissolved in 3 co. of isotonic salino, were given.

Twenty four hours after the peniculin was started. the character of the discharge changed radically It was still profuse but was now creamy white in appearance and no longer had an offensive odor There was no soreness at the sites of injection and the patient experienced no malaise at all. Smears obtained on December 31, 1943 and January 10, 1914, and cultures taken on Jenuary 3, 1944, and

January 10 1944, were negative charge remained profuse.

Mrs. K. F. a pregnancy proceeded normally during the sulfonamide and penicillin therapy, and on January 25 1944, she was delivered of a 0-pound 12-ounce girl by low midforceps under local anesthesa. The child was npparently under local anesthesa. it was noticed that the vulva was swellen although there was no evidence of any discharge Two vul var smears, taken twelve hours epart, were negative for the genecoccus. The vulvar edema disappeared on the aixth day of the infant's life. The mother and baby were discharged on the tenth postpartum

day in excellent condition.

The patient was seen again three weeks and five weeks postpartum On both occasions cerrical smears and cultures were negative for the gonococcus. Hor pelvis was entirely normal, and her vagina was free from any evidence of inflammation. The baby has progressed normally and is without

atlgmata of eny type.

#### AN UNUSUAL ELECTROCARDIOGRAPHIC FINDING IN MYOCARDIAL INFARCTION

HARRY L JAFFE, \* Lt., (MC V-S), USNR, ARTHUR M MASTER, † Capt., (MC V-S), USNR. and HENRY KALTER, Lt (MC), USA

\*From the U.S. Naval Hospital, Bainbridge, Marylahd, and the Cardiographic Department and Medical Ser-(vices, Mt. Sinas Hospital, New York City † and U.S. Naval Hospital St. Albans, New York.)

CORONARY occlusion with myocardial infarction is usually associated with characteristic changes in the electrocardiogram which follow a typical course 12 RS-T elevations and Q waves as a rule oppear soon after the attack and the RS-T alterations progress from day to day into T-wave inversion during several weeks or months. Occasionally the electrocardiogram remains unaltered for several days and then shows progressive When infarction occurs as a result of coronary insufficiency without occlusion RS-T depressions and T-wave abnormalities may appear These may also show progression, but this rarely continues more than several days or weeks, in fact if the initial alterations are definite, they may regress rapidly

The opinions and views set forth in this article are those of the writers and are not to be considered as reflecting the pol-icies of the Navy Department.

A hitherto unrecorded deviation from the ordin ary sequence was observed by us in approximately 2 per cent of 600 cases of coronary occlusion. It consisted of a temporary improvement in the characteristic electrocardiogram between the third and eighth days after the onset 1 e , the T waves became less inverted end the RS-T elevations or depressions less marked. Thereafter the expected progressive changes occurred. In some cases the electrocardiogram lost its specific pattern during the period of improvement. The following two cases are reported because the electrocardiogram reverted actually to normal about the fifth day and the typical progressive changes did not reappear until the tenth day

#### Case Reports

Case 1—L. M \, a 34-year-old Negro, was brought to the Naval Hospital because of the sud-

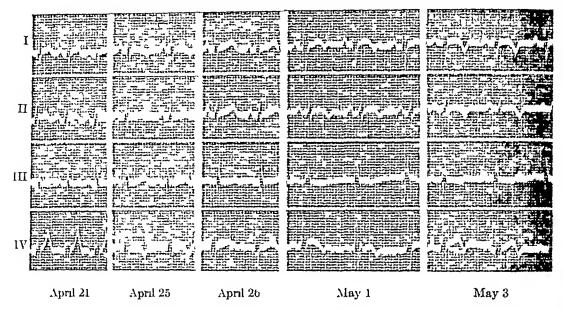

Fig 1 L. M N, male, age 34 April 21, 1944—Sinus tachycardia, rate 140 beats RS-T-I and II slightly elevated April 25, 1944—Rate 95 RS-T no longer elevated T-I and II inverted, T-II diphasic, T-III upright April 26, 1944—Record within normal limits May 1, 1944—RS-T-I, II, and IV slightly elevated, T-I and IV diphasic May 3, 1944—RS-T less elevated, T-I, II, and IV deeply inverted

den onset of pain in the epigastrium and beneath the lower end of the sternum Dyspnea and numb-ness in both arms were present. The patient had had similar attacks of mild nature for several years and he had been told on one occasion that his blood pressure was elevated. Physical examination revealed severe dyspinea. The heart was not enlarged, the cardiac rate was 150, and gallop rhythm was present. There was no precordial friction rub. The temperature was 100 F, and the white blood count was 23,000 with 84 per cent polymorphonuclears. The Kahn test was negative. The patient was placed in an oxygen tent. The following day the temperature rose to 102 F. There were numerous rales in both lungs. The teleoroent-generating gave evidence of convestion or bronchoand he had been told on one occasion that his blood genogram gave evidence of congestion or broncho-pneumonia. The cardiac rate was still 150. On the third day the patient was much improved, the lungs were much clearer, and the cardiac rate was lungs were much clearer, and the cardiac rate was below 100 The cardiac sounds were distant The sedimentation rate was accelerated Four days after admission the patient became stuporous and palsy of the right side of the face and of the right arm appeared. This was followed by paralysis of several of the extraocular muscles of both eyes.

The temperature returned to normal on the sixth day and the general condition of the extract.

day and the general condition of the patient rapidly improved. The cardiac rate remained normal, the cardiac sounds regained normal intensity Fluoroscopic examination after four weeks showed the heart to be normal in size and the pulsations to be normal. There was gradual regression of the

neurologic signs

The first electrocardiogram, taken soon after admission (Fig 1, April 21, 1944), showed slight elevation of the RS-T segment in leads 1 and 2 There were no Q waves or T-wave abnormalities record thus suggested the presence of acute per-carditis, but the following day T-I, -II, and -IV were inverted. Such a rapid change was in favor of myo-

cardial infarction. Three days later the RS-T elevations had disappeared and there was a reciprocal relationship between leads I and III, 1 e, T-I was inverted and T-III upright (Fig. 1, April 25, 1944) This indicated coronary occlusion with infarction of the anterior surface of the left ventricle very next day, the fifth day after the attack, the electrocardiogram was normal (Fig. 1, April 26, 1944). The S wave in lead I was larger than before, raising the question of pulmonary embolism, but this could be excluded clinically. A record taken three days later was also normal. On the eleventh day the sleeters eleventh day the electrocardiogram again showed RS-T elevation in leads I and II and semi-inverted T waves in leads I, II, and IV (Fig. 1, May 1, 1944) Thereafter, the RS-T segments returned to normal and the T waves became deeply inverted (Fig. 1, May 3, 1944)

Case 2 -R. E (400980), a gymnastic instructor aged 37, was admitted to the Mt Sinai Hospital three days after an attack of precordial pain lasting two hours On admission he was not acutely ill and did not complain of pain Retinal examination showed increased tortuosity of the arteries with exaggerated light reflex. The lungs were clear The heart was not enlarged, the first apical sound was split, the rate was 70 beats per minute, the rhythm was regular. The blood pressure was 130/ 90 The radial arteries were moderately thickened. The liver was not palpable The temperature was 101 F, the leukocyte count was 14,850 The circulation time and venous pressure were

normal The patient remained in the hospital five weeks and during this time his course was uneventful. The blood pressure fell to 104/64 and then regained

its former level

In view of the mild nature of the precordial pain and the quick recovery of the patient the exact nature of the coronary episode was not certain on

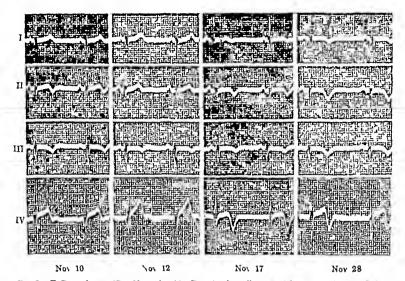

Fig 2 F. R. male, age 37 November 10—Sinus bradycardia, rate 60 beats per minute. Left axis deviation. T-II diphasic, T III loverted November 12—T II now upright, T-III only alightly inverted November 17—T I diphasic, T II T-III and T IV inverted. November 28—T-waves definitely inverted in all leads indicating myocardial infarction.

admission. However, the presence of tover and leukocytosis indicated myocardial infarction rather than a simple anginal attack, and this seemed to be confirmed by the electrocardiogram, which showed diphasic T-II and loveried T-III (Fig. 2 November 10) three days after the attack. Two days later the record was normal, for T-II had become upright and T-III was only alightly inverted (Fig. 2, November 12). Yet on the tenth day and thereafter the electrocardiogram (Fig. 2, November 17 and 28), showed marked inversion of the T waves in all leads, particularly in II, III, and IV. These progressive changes are typical of myocardial infarotron. Pericarditis also produces T-wave inversion in all leads, but there was no clinical evidence of this condition to this case.

#### Comment

These cases emphasize the importance of taking serial records wheo myocardial infarction is suspected. If only one electrocardiogram had been taken, about the fifth day after the attack, a normal record would have been found and the correct diagnosis of myocardial infarction might have been discarded. When such a diagnosis is made climeally and the first electrocardiogram is normal, it is essential to cootinue taking records every few days during the first two weeks. If no change has occurred during that period the diagnosis may be excluded. We believe the exceptions to this rule are very rare if multiple chest leads are taken.

As a rule, infarction due to coronary occlusion can be differentiated electrocardiographically from that following coronary insufficiency. In coronary occlusion RS-T elevation and/or Q waves are usually present and there is a receptocal relationship between leads I and III. Coronary insufficiency, on the cootrary, is usually associated with RS-T depression or T-wave inversion in one or more leads.

Therefore, the infarction was produced hy coronary occlusion in the first case, in which the RS-T segment in lead I was elevated. Since the lofarctico involved the anterior surface of the left ventricle, the absence of Q-IV is unusual, it is present in over 80 per cent of such cases. The occurrence of cerebral embolism is commoo to coronary occlusion, we have not observed it in corooary rosufficiency second case would seem to fall into the group of infarction following corenary insufficiency rather than occlusion since only T-wave loversions were present and RS-T elevation and Q waves were absent. Wo have found that myocardial infarction associated only with T-wave changes usually has a good prognosis and therefore our postmortem experience with this type of case is limited Io the cases examined the infarction was almost always on the basis of coronary insufficiency Although the presence of marked inversion of the T waves after eighteen days. as occurred in this case is more common in infarction following occlusion, it may occasionally be seen

in coronary insufficiency

The explanation of the temporary return to normal of the electrocardiogram in the cases reported and of the transient improvement observed in other cases of coronary occlusion may only be surmised. It is possible that in these cases much of the initial circulatory derangement is due to collateral spasm which becomes less severe after several days, resulting in a reduced degree of anovemia of the involved myocardium. Later, the progressive changes of the several stages of infarction appear.

### Summary

Attention is drawn to a transitory improvement in the electrocardiogram in occasional cases of myocardial infarction. It occurs three to eight days after the attack. In the two cases reported the electrocardiogram temporarily returned to normal

### OLIGURIA AND RENAL CALCULUS RESULTING FROM THE ADMINISTRATION OF SULFAMERAZINE

HARRY MANDELBAUM, MD, and HARVEY J AMSTERDAM, MD, Brooklyn, New York (From the Jewish Hospital)

BECAUSE of the increased solubility of sulfamerazine in the urinc and the slow rate of its excretion, it was hoped that the occurrence of renal complications would be eliminated by the use of sulfamerazine in place of sulfadiazine

Welch and his coworkers' showed that sulfamerazine was more rapidly and more completely absorbed from the gastrointestinal tract than sulfadiazine. In comparison with sulfadiazine, sulfamerazine was more slowly excreted in the urine and therefore appeared in lower concentration. Given in toxic doses to monkeys and dogs, the toxic effects were dependent on the precipitation of the sulfamerazine in the renal tubules, pelves, and ureters

Hall and Spink's reported favorably their experience with sulfamerazine in 116 cases were but two instances of renal complications, one after receiving 24 Gm, the other after receiving 17 However, Dowling and his associates' were not favorably impressed in their 428 cases that reccived sulfamerazine They reported no significant difference in the incidence of any individual toxic reactions in the cases treated by either sulfamerazine or sulfadiazine, with the exception that renal calculi were more frequent following the administration of They considered renal calcula as sulfamerazine present if there was pain in the region of the kidneys. gross hematuria, definite anuria, or oliguria, or any combination of these Renal calculi resulting from sulfamerazine administration occurred in 35 per cent of the patients receiving that drug as compared with an incidence of 1 3 per cent in the patients receiving sulfadiazine

In the case herein reported oliguria, hematuria, and a renal calculus developed in a patient who had received a total of 8 Gm of sulfamerazine

### Case Report

Case 1—S W (274685), a 44-year-old white man, entered the Jewish Hospital on May 10, 1944 He had never been ill previously Ten days before admission, he complained of difficulty in swallowing,

feeling as if "a lump was in his throat" On May 4, the pharyngeal symptoms became worse and he began to run a fever of 101-102 F rectally He consulted his doctor on May 7 and 10 grains of sulfamerazine with 20 grains of sodium bicarbonate This dose was taken every five were prescribed The following day an otolaryngologist diagnosed the condition as a pharyngeal abscess He ordered the drugs to be given at two-hour intervals. After the sixth dose the patient became nauseous and vomited all food and medication In all, he had taken a total of 8 Gm of sulfamerazine consumed a large volume of fluids up to the time he During the early morning hours started to vomit of May 10 he noted that he was voiding scarcely any urine in spite of a constant desire to do so Prin of a dull character appeared in the right flank. It In the twelve soon became intense and colicky hours preceding admission he passed about 1 ounce Cystoscopy Was of urine that was frankly bloody A number 20 performed on the day of admission cystoscope was passed without difficulty Many small cc of bloody urine was obtained Many small crystals were noted at the ureteral orifices A number 6 ureteral catheter was passed into the left renal pelvis and 12 cc of bloody urine was obtained by aspiration No obstruction was revealed and lavage of the pelvis was done A similar catheter An impassable ob was passed up the right ureter struction was met 3 cm above the ureterovesical

On admission the urea nitrogen of the blood was 191 mg per cent. The sulfamerazine level of the blood was 56 mg per cent. Urinalysis revealed a specific gravity of 1 022, 2 plus albumin, and gross blood. His temperature was 100 F. He was immediately started on 2,000 cc of 5 per cent glucose in physiologic saline intravenously, to which was added two ampules of sixth-molar sodium lactate.

The following day he continued to complain of the severe right lumbar pain. There were frequent episodes of colic. The temperature rose to 102 F. Fluids were forced (3,000 cc per day) and 20 grains of sodium bicarbouate were given every four hours. He secreted 600 cc of urine. On the third day, he passed a small calculus. Following this, the temperature returned to normal and the

pain and soreness of the right flank quickly subsided. His throat felt better The unnary output on the feurth day was 1,200 ce Microscopic red blood cells were found in the unne until the ninth day The ures nitrogen was normal after the fourth day

#### Summary

This case represents an instance of ronal calculus developing in a patient who had received aufin meranne. Obguria, frank hemituria and characteristic ureteral colo developed after a total of 8 Gm had been taken. Cystoscopic ureteral briga.

tion was possible only on the left sade because the right treter was blocked by a calculus Intravenous fluds with sodium lactate and 5 per cent glucose in physiologic saline helped re-establish urman, flew but complete relief was obtained only infer the calculus was passed

#### MEDICAL ASPECTS OF COMPULSORY MILITARY TRAINING

A year's training in patriotism conducted by the Army or the Navy may be beneficial to our country in ways other than national defense. There was a time, not so many years ago when the bringing together of great numbers of people was not without danger. Until the present century, nrmies had more reason to fear disease than the enemy. This is no longer so. The "camp decises" typhoid fever typhus fever and the dysonteries have been conquered. Modern santintion and immunelogy have made army camps as safe as health rosoits. Bo we may check off health hazards as an argument against compilisory military training.

against compulsory military training
What are the benefits that may be expected?
In the first place, there will be a complete physical
examination of each trained as he reaches the ago
for training, something that is worth while in itself
There should be no rejectoes in this examination,
but rather a classification. The remedial defects
would, of course, be corrected. Those with physical
defects that cannot be corrected could be put in
special classes. Sumpt be provided to rediction, just as
backward children in the public schools are put in
special classes. During the period of training, health

education could be taught in a very practical manner. At the end of the course the graduates would have a better idea of the value of a balanced diet, to mention only one item. They certainly would make a better showing physically than the freshman in college made before the war.

From a medical point of view there can be only ene argument against compulsory medical training. Already the medical student, and presumedly the same applies to other branches of technical training, reaches the period of usefulness to the public too late in life

Unless some steps are taken to telescope some of the necessary pretechnical training into the year of military training, the plan will make the doctor (or engineer) one year older when he begins practice

Whether the training should be extended to girls is more debatable. All changes that modern civilization has influeted upon women have had a tendency to minimize the influence of home. If girls are to be included, we hope that demestic science will have a prominent place in the curriculum—Virginia M. Monthly, March. 1945.

#### SCREEN TESTS

As a method of tuberculous case-finding the screening of large groups of apparently healthy individuals by means of chest x-rays is here to stay

It should not replace the recognized routine methods of case-finding by means el examination of individuals who have been in close association with

tuberculous patients or who have symptoms referrable to the lungs. Rather, it should serve as an excellent auxiliary method for the discovery of new cases and in that way provide to health departments many additional opportunities for the promotion of their tuberculous's control programs.—William Stepal M.D., "Health News," Nov 13, 1944

# PEPTIC ULCER MANAGEMENT

Knox Golatine is successfully used in the frequent between meal feedings that are often desirable in the management of peptic ulcer

Given at hourly intervals, Knox Gelatine has provided a satisfactory control of the gastric secretions and gives relief from the painful symptoms

A Special Ulcer Diet described in the Knox booklet, "Peptic Ulcer Dietary," has been prescribed by many physicians It is a complete diet biand and liberal in calories and protein We will be happy to send you as many copies of it as you wish

FOR THE FREE Special Ulcer Diet 'Peptie Ulcer Dietary" leaflet and other special diet booklets, clip and send this coupon.

# Postgraduate Medical Education

Programs arranged by the Council Committee on Public Health and Education of the Medical Society of the State of New York are published in this Section of the Journal The members of the committee are Oliver W H Mitchell, M D, Chairman (428 Greenwood Place, Syracuse), George Baehr, M D, and Charles D Post, M D

### Hematologic Disorders

A GENERAL résumé of hematologic disorders including the anemias was given by Dr Ellery G Allen, associate professor of clinical medicino and clinical pathology, Syracuse University Collège of Medicine, at a meeting of the St Lawrence County Medical Society at 12 15 PM on June 14 at the Massena Country Club, Massena

Dr Allen's postgraduate instruction was a presentation of the Council Committee on Public Health and Education of the State Medical Society

### SUDDEN ASPHYXIAL DEATH

Asphysial death is usually sudden. A boy goes out to swim too soon after a big meal, is seized with "cramps," drowns alone, or if pulled ashore fails to rally Firemen or police come with a "resuscitator," but resuscitation is not accomplished. One sometimes wonders why a physician is not called Has the public lost confidence in our ability to revive an asphyxiated person? Of course, the glamor of the police or fire wagon is appealing and spectacular, while the physician must work quietly, without fanfare. The mechanical contrivance has saved an occasional life, but it is common medical opinion that it may do more harm than good, be-cause its use is not based on an understanding of the causes of asphyxia, such as a blocking of the lower airways by a foreign body, or failure of the respiratory center in poliomyelitis In any case, immediate action is called for, but this must be based on a thorough knowledge of the art of resuscitation How many physicians are prepared to carry out all the intricate details of this art?

In 1933 an article was published in the American Journal of Surgery entitled "Asphysial Death a Professional Disgrace" Out of the interest it aroused the Society for the Prevention of Asphyxial Ddath was incorporated, with its founder, Dr Paluel J Flagg, as president-director The necessity for research and for the dissemination of knowledge to all physicians, nurses, hospitals, and public health agencies was promptly recognized by most county, state, and other medical societies The American Medical Association appointed a Committee on Asphyxia in 1937 and every professor of obstetrics who could be found was circularized Some sixtythree medical schools replied, but little came of the new movement In 1939 it was revived by Surgeon General McIntire when he opened a department of pneumatology at the World's Fair, but the impetus again soon died out chiefly because instructors were lacking, or could not give the time demanded with-out remuneration "No funds" was the phrase heard in most hospitals

The Children's Bureau, in Washington, and the director of maternal and child welfare responded, but again there seemed to have been no funds which could be allotted to this great enterprise

All forty-eight states were informed of the need, fifteen responded. Even today, after ten years of effort, many physicians and institutions seem to know little or nothing of either the need or the methods of reviving the asphyxiated. Dr. Flagg is asking some pertinent questions. Of the general practitioner he is inquiring, What treatment do you advocate for the various stages of asphyxia? Of the nurse, How would you treat a case of asphyxia if left entirely alone with such a problem? Of the hospitals, Whom of your staff would you callasan "expert" in a case of asphyxia in the operating room or in the accident room? What is your routine in carbon monoxide poisoning, electric shock, ehemical gas poisoning, shock from total submersion, asphyxia neonatorum, acute respiratory failure in poliomyelitis?

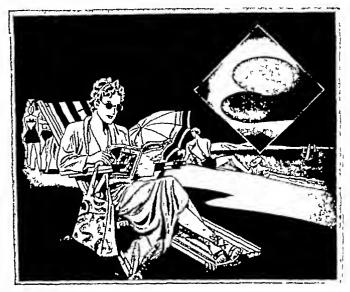

What routine is followed in an ear and throat postoperative patient who shows signs of asphyxis after being put back to bed? Of medical school officers he would like to know what instruction is given to students if they were called on to revive an asphyxiated person, other than the Schafer or the Silvester method? How many can use an electrically lighted laryngoscopo or remove a foreign body by direct vision? of firemen and policemen What stages or degrees of asphyxia can you mon recognize? Give the treatment you would apply other than mechanical Impending death from asphyxia is of immense importance. Why then is so little known about it among "general men?" Answer They have never heen taught

In order to raise money to do just this, Dr Flage has a plan wherehy anyhody who lost a son in this War may huy a twenty-five dollar bond, and offer it or its equivalent to the Society for the Prevention of Asphyxial Death to develop a fund, the proceeds from which may be used to instruct doctors, nurses, and other medical personnel in the art of resuscitation Certainly the need is great, we hope the "plan" will work enormous good to a great host of unfortunate persons about to die from asphyxia of whatever kind They can he saved, they must be saved The method is at hand Only wide distribution of the method is needed, but it will take money to do it —M Rec. Dec. 1944

### The Problem of Rents for Physicians' Offices Under the OPA

IN RESPONSE to a communication from a physician who maintains an office and residence at the same address and was to be subjected to an increase in rents, Mr William F. Martin, Counsel to the Medical Society of the State of New York, submits the following information from the Chief Branch Attorney of the O P.A

This is to advise you as to the rights, under the Rent Regulation, of physicians in this State who reside and maintain their professional offices in the same apartment or in the same dwelling house

Where the physician maintains one apartment in a given building for his residence and another in the same building for his office, there is no problem since the former is governed by the Rent Regulation for Housing and the latter is exempt therefrom. Where, however, only one apartment is involved in which there is a combined use by the physician, two tests are to be used to determine the extent, if any, to which the Rent Regulation controls the unit First, are the professional and dwelling portions separable? Second, if they are not, what is the predominant use?

If the professional and dwelling portions are separable, only the dwelling portion is subject to the Rent Regulation. If they are not separable, then either both portions are subject to the Rent Regulation or neither is controlled. Separability exists if the physician characteristics of the property are such that it is feasible for the tenant to remain in occupancy of the dwelling portion while some other person is using the business portion. The portions are separable where there are separate means of access, the dwelling portion is usable as a dwelling without the need for access to the business portion, the business portion does not require access to the dwelling portion, and the dwelling portion is, or can readily be, completely shut off from the business portion.

Assuming the lack of separability as above described, there remains to be determined only whether the predominant use of the whole unit is dwelling or professional. The initial test of predominant use is to be made on a space basis so that if a predominant part of the space is used for professional purposes the whole unit is exempt from the Regulation, and vice versa Where less than a predominant part of the space is used for business purposes (and also where the space test cannot be used because there is no physical segregation of the space used for business purposes and of that used for dwelling purposes), a second test of predominant use in terms of rental value is to be applied. If the rental value of the business portion (or of the business use where the two uses are not physically segregated) is clearly in excess of the rental value of the dwelling portion, the property is not subject to the Regulation, otherwise it is

Thus, the property as a unit is free of control by the Regulation where either (1) the predominant use, on a space basis, is for business purposes, or (2) the rental value of the business portion is clearly in excess of the rental value of the dwelling por-

If neither of these tests is satisfied, the property as a unit is subject to the Regulation

Where, by the application of the foregoing criteria, it is established that the unit is subject to the Regulation, no exaction of rent in excess of the maximum rent is permissible

IRA A. SCHILLER

#### HEALTH PROGRAMS IN INDUSTRY

Hospitals in general are reluctant to adopt the modern methods of tuberculosis control because of the expense involved. A similar stand was taken by industry not many years ago in reference to industrial hygiene and medicine. Experience, how-

ever, has convinced industry, large and small, as Dr Victor G Heiser puts it, that, "in war or in peace, no plant is too small to profit from a health program."—Maxim Pollah, M.D., Hospitals, Sept., 1944

The coil spring in the rim of the "RAMSES" Diaphragm is flexible in all planes permitting adjustment to muscular action.

The spring used has sufficient tension to insure close contact with the vaginal walls during use,

The spring is covered with soft rubber tubing which serves to protect the patient against Madre spring pressure. Also provides a wide unindented grea of contact.

### Dr Korns Appointed Acting Assistant Director of Communicable Diseases Division

DR ROBERT F KORNS, former epidemiologist in the Division of Communicable Diseases, has been appointed acting assistant director of the Division for the duration of the war, succeeding Dr Herman F Senftner, who recently retired. He assumed the duties of his new position May 1

Dr Korns, a Dartmouth College alumnus, studied medicine and public health at Johns Hopkins University, from which he was graduated with the degrees of M D (1937) and Dr P H (1939) He has been associated with the New York State Department of Health since 1939, serving first as epi-

demiologist-in-training and later as assistant district health officer. For more than a year he was acting district health officer in charge of the Amsterdam district.

In addition to carrying on the duties of the position of epidemiologist in the central office at Albany since 1941, he has been instructor in preventive medicine and public health on the staff of the Albany Medical College, assisting in both the undergraduate public health courses and the Extension Course in Public Health which qualifies for Grade II health officers

### Service Rules Eased for Doctors in Army

MAJ GEN GEORGE F LULL, deputy general of the Army, announced on June 11 that under a new War Department program, medical officers released from service overseas can decide for themselves whether they wish to accept continuing assignments with the Veterans Administration in this country

The new rule, he said, would replace present regulations under which officers returned home from the battlefronts have been compelled to accept transfer to veterans' hospitals even though many have protested that such assignments violated the terms of their enlistment for military service only

While the new regulations go into effect immediately, they would not change the status of officers

now serving with veterans' facilities in this country until some time in August or September, General Lull said

It would require at least until then for replacements to supplant officers who have been drafted for service with such hospital units, and not many could expect releases at least for a year or more, he said. The only way by which such officers could be mustered out would be for them to await replacement on the basis of military necessity and adjusted service records.

The new regulation, however, provides for the return to veterans' hospitals of all officers who before active military assignments had been associated with the administration, General Lull said

### National Advisory Health Council Meets

THE first meeting of the National Advisory Health Council since the passage of the Public Health Service Act of 1944 was held June 19 and 20 in Wilson Hall, National Institute of Health, Bethesda, Maryland, Surg Gen Thomas Parran, of the Public Health Service, Federal Security Agency, announced on June 18

The Council, which serves in an advisory capacity to the Surgeon General, reviewed present and postwar plans of various Public Health Service Divisions and offered recommendations for meeting existing conditions resulting from the war

The National Institute of Health presented problems pertaining to the extension of grants-in-aid for additional research and methods of assistance to young scientists by means of fellowships, and gave a summary of the work of the institute and laboratories The Bureau of Medical Services presented statements from the Division of Mental Higgene, the Foreign Quarantine Division, the Inter-Service Committee for the Control of Exotic Diseases, and the International Health Relations Section A report was also heard from the Bureau of State Services encompassing the State Relations Division, Venereal Disease Division, Tuberculosis Control Division, and Public Health Nursing

The Office of the Surgeon General explained the work of the Engineering Division and discussed the preparation of adequately trained public health personnel for the nation, the development of a modern training center for Public Health Service officers and others, and the loan of Public Health Service personnel to schools of public health and commissioning and periodic calling to duty of personnel of the schools of public health for practical experience

### County News

### Albany County

Approximately forty physicians of the state, who are qualifying for Grade Two health officers, attended a public-health extension course conference in the DcWitt Clinton Hotel on June 6 The course is conducted by Albany Medical College and the State Health Department Dr Henry E Meleney, professor of preventive medicine at New York University, discussed malaria in the armed forces and its relation to postwar malaria in New York State Dr James E Perkins, director of the Divi-

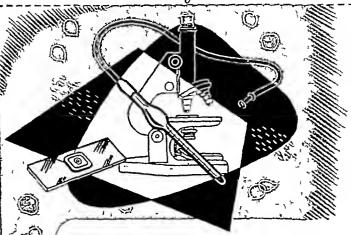

sion of Communicable Diseases of the Health department, presided \*

### Bronx County

present status of malpractice defense and insurance in the State medical society Dr Moses H Krakow then delivered the president's report

### Clinton County

The county society held its semiannual meeting at the Cumberland Hotel on May 22 The business meeting at 5 30 P M was followed by dinner at 6 30

Maj Norman Levy and Maj Anthony D'Alfonso of the A.A.F. Convalescent Hospital,

Plattsburgh Barracks, were the principal speakers
Major Levy discussed "Emotional Problems of
Returnees" Major D'Alfonso spoke on "A Flight Surgeon's Experience in the South Pacific."

Medical officers from Plattsburgh Barracks were invited to attend the meeting \*

### Dutchess County

The annual outing of the county society was held at the Harlem Valley State Hospital, Wingdale, on June 13 Golf was played in the afternoon and dinner was held at 7 00 r m Dr James Rooney, of Albany, was the guest speaker

### Greene County

A living memorial to two of Catskill's outstanding citizens and well-beloved physicians will shortly he presented to St Luke's parish The Memorialshrubbery to be planted on the William street side of St Luke's rectory—will be given by Mrs Dean W Jennings in memory of her late husband, Dr Dean W Jennings and his brother-in-law and former associate, Dr Lyle B Honeyford.

The shrubs will not be already with T.

The shrubs will not be placed until Fall Dr Jennings and Dr Honeyford were leaders in the field of medicine and the promotion of better health in the village and county in which they lived and served. It was largely through Dr Honey-ford's untiring efforts and "missionary work" that the Memorial Hospital of Greene County was built \*

### Jefferson County

The annual outing of the county society was held on June 14 at Lake View House at 5 00 PM Fol-lowing games dinner was served Three movies were then shown

#### Kings County

Capt George Rosen, (MC), Brooklyn, has been awarded the Grant Squires Prize for his book, "The History of Miners' Diseases A Medical and Social Interpretation." The prize is given every five years to a graduate of Columbia University for original investigation of a sociologic nature. The presentation was made at Columbia's commencement exercises on June 5

### New York County

Capt Gottlieh Helpern, (MC), AUS, spoke before the Sydenham Clinical Society meeting on his personal observations made in the Italian theater of operations at an Army General Hospital. His subject was "Acute Infectious Hepatitis With and Without Jaundice."

The new officers of the New York Society for Clinical Ophthalmology for 1945-1946 are president, Dr Maurice L Wieselthier, vice-president, Lt. Comdr Benjamin Friedman, Recording Secretary, Dr Leon Ehrlich, Corresponding Secretary, Dr Benjamin Esterman, and treasurer, Dr Daniel

Meetings will be held on the first Monday of each month from October through May at the New York Academy of Medicine

The Board of Health of the city of New York amended on June 12 Section 118 of the city's Sanitary Code to prohibit the sale of sulfa drugs or sulfa-containing products for internal or external use without a prescription The han becomes effective without a prescription

October 1

The board's action followed a recommendation by the public health relations committee of the New York Academy of Medicine and other health groups that pointed out that sulfa drugs in any form could he used safely only under expert supervision and at a physician's direction

Acting Health Commissioner Frank A Calderone explained that sulfa drugs were "a two-edged

sword."
"In the hands of a physician they are one of our most valuable weapons against certain dangerous diseases," he added "Used indiscriminately, howdiseases," he added ever, they do a great deal of harm, even when employed in small concentrations"\*

The Health Department has taken another step to make it easier for women eligible for care under the Emergency Matermty and Infant Care plan to receive assistance, according to a statement issued by Acting Health Commissioner Frank A Calderone on June 15 "Beginning today," said Dr Calder-one, "in each of the city's twenty-one Health Department district health centers, a nurse especially trained for the job will be on hand to personally interview applicants and to aid them in securing the best possible care"

#### Ontario County

Dr Albert Kaiser, Rochester physician, was guest speaker for Dr J W Howard at the May meeting of the Canandaigua Medical Society in the Canandaigua Hotel His topic was "Insurance and the Practice of Medicine

Dr Gustav Selbach was host Dinner at 6 15 PM preceded the business meeting and program

Dr Selhach was host to the Canandiagua Medical Society on June 1, when Dr J Wendall Howard, of East Bloomfield, was reader His topic was also "Insurance and the Practice of Medicine"\*

#### Steuben County

The summer meeting of the county society was held on June 14 at the Veterans Administration Facility in Bath Following luncheon at 1 00 P.M. and a business meeting at 2 00 P.M. Dr. Samuel R. Kates, of the Veterans Facility, spoke on "Rickettsia Diseases and Virus Infection"

### Ulster County

The regular meeting of the county society was held on June 6 in the Library of Kingston City Laboratory, at 9 00 PM Dr George W Ross was chairman of the countries essent, which consisted of a lecture on the countries can be considered. a lecture entitled "Relation of Ohstetrics to Gyneco logical Lesions" by Dr William T Kennedy, of Woman's Hospital, New York City, followed by

[Continued on page 1580]

Notwithstanding wartime handicaps, G E,'s Periodic Inspection and Adjustment Service continues its role of expert electrical and mechanical mainten ance of x-ray and electomedical equipment

Fifteen years ago, we announced to all users and prospective users of G E x ray and electromedical apparatus that henceforth there would always be conveniently available to them a corps of factory trained experts on whom they could rely to Leep their equipment at its highest operating efficiency

Today throughout the United States and Canada, this Periodic Inspection and Adjustment Service is acknowledged to be a prune consideration in any evaluation of G Hequipment—a consensus which obviously is based on gratifying experiences.

Thus P I and A, has stood the test of time—yes even through these war years when pre-war promises have at times seemed impossible of fulfillment.

The long established high standard of efficiency of P I and A service is still adhered to and

while the cost of providing it has obviously increased, those who contract for it are enjoying the same rates as prevailed before the war.

It is facilities such as this, readily available through our nationwide field organization, which justify and enhance every investment in G E equipment.

For helpful information and suggestions, you can rely on your nearby G E representative. Write today for his address.

JUST OUR HITTETH YEAR OF SERVICE THAT

### Improvements

Construction of two new buildings at Rhoads General Hospital-the Post Library and the central

surgical supply building—was announced on May 28 by Col A J Canning, commanding officer

The two buildings are both of concrete block construction The library, 76 by 30 feet, cost \$17,000 and the supply building, 67 by 26 feet, cost \$19,000

The surgical supply building was recently completed and already is filled with surgical equipment for issue

The library building consists of a main library room and a smaller room which will house the hospital's medical library In addition, there will be an office and workroom

Plans for the buildings were made by the New York district engineer and Capt Joseph R Matullo,

post engineer at Rhoads \*

Patients in the Alice Hyde Memorial Hospital, Vialone, suffering respiratory ailments, such as pneumonia and asthma, and cardiac maladies, will now receive oxygen therapy through a new machine of the latest improved model, recently purchased by the hospital

The machine is a complete portable air-conditioning unit that provides the patient with comfortable conditions of temporature and relative humidity while he is breathing the prescribed concentration The refrigerating unit cools and cleans the air and removes excess humidity, forcing circulation changes into the tent enclosure four times a minute \*

A modern iron lung has been received at Highland Hospital, in Beacon, hospital officials announced on May 22 The "lung" was received from the Dutchess County chapter of the National Foundation for Infantile Paralysis

The respirator is the first to be located in Beacon and will enable the staff of the local hospital to render a more efficient service in cases requiring artificial respiration

The "lung" is one of the few to be located in the county, Vassar and St Francis hospitals in Poughkeepsie also having them It was secured through Thomas Mylod, chairman of the county Infantile Paralysis Fund

Dr Newton J T Bigelow, new director of Marcy State Hospital, has been appointed a member of the State Salary Standardization Board by Governor

Four other appointees to the board were T Har-

low Andrews, Loudonville, division of placement

and unemployment insurance, Dr Arthur Sullivan, chief psychiatrist in the Harlem Valley State Hos-

pital, Wingdale, department of mental hygiene, and Everett N Mulvey, Albany, division of the budget, and Milton Musicus, Albany, department

Dr Bigelow, acting deputy commissioner of

The law required the Civil Service Commission and the budget director to refer to the board all new job titles which the board must allocate to an ap-

mental hygiene, is chairman of the temporary salary standardization board, created in 1937 A 1945 law, recommended by Dewey, established a permanent board

### **Newsy Notes**

The tuberculosis sanatorium maintained since 1913 at Mount McGregor by the Metropolitan Life Insurance Company for the treatment of its employees will be closed on September 1 because of recent reductions in the number of patients and the period of treatment for tuberculosis, it was announced on May 31

The announcement, made by Frederick H Ecker, chairman of the board, and Leroy A Lincoln, president of the company, said patients now at the sanatorium would be treated at the company's expense in comparable sanatoriums nearer their homes Facilities near the patients' homes and families also will be used in continuing the company's efforts to combat tuberculosis among its employees

The Mount McGregor Sanatorium, located in the foothills of the Adirondack Mountains near Saratoga, occupies 1,600 acres Since it was opened, 3,507 employees have received treatment there \*

Members of the board of the Genesee Memorial Hospital, Rochester, entertained the members of the Genesee County Medical Society and their wives at dinner on May 22 at the Stafford Country Club

at dinner on May 22 at the Stafford Country Club Dr Raymond L Warn, of the hospital board, introduced the doctors in the medical society and

their wives

The committee in charge of the event was made up of Mrs Homer A Harvey, chairman, Anthony H Garnish, of Elba, T A. Buhl, William R Walls, and Dr Warn, of Oakfield \*

A Dr Ludwig B Goldhorn Memorial Library, to be founded through funds contributed by the medical staff of Mount Vernon Hospital and members of the Mount Vernon Medical Society and friends, will be established at Mount Vernon Hospital, it was announced on May 23 by the Hospital board of trustees

The library will honor Dr Goldhorn, who died on November 16, 1944, after serving the hospital for thirty-six years as roentgenologist, establishing the first x-ray laboratories at Mount Vernon Hospital

In addition to many books, the library will be the repository for some of Dr Goldhorn's mementos, including his first x-ray tube, which will be contributed by Mrs Goldhorn This tube was one of the first ever used in America

The names of sixteen candidates for membership on the hospital board of trustees were presented at a meeting on May 21 by a nominating committee consisting of Norman D Ellison, as chairman, Harry R Marshall, Irving Reynolds, J O M Van Tassel, and Myron Walker

James H Cavanaugh and A F Maxwell were nominated members of the class of 1946, and Albert L Farr and William L Frager, the class of 1947

L Farr and William L Fraser, the class of 1947
The retirement of Dr Frank A. M Bryant, who recently moved to California after being a member of the courtesy staff for many years, was accepted with regret, as was the resignation of Mrs Ralph S Hall from the board of trustees

Peter Pappas was elected to the board, class of 1947, to fill the vacancy caused by the recent resignation of Mrs Pappas, and several appointments to the hospital medical staff were approved upon recommendation of the medical board and joint advisory committee

The annual meeting of the Mount Vernon Hospital Association was held on June 18 in the Nurses' Home Arthur L Zerbey, president of the board of trustees, was in charge of the meeting \*

Mr Max H Rhulen, president of the Monticello Hospital, has announced the appointment and acceptance of Mayor Luis de Hoyos as general chairman of the campaign for the Monticello Hospital for Thompson Township, and Earl A Stratton, of South Fallsburgh, as general chairman for Fallsburgh Township Mr Morris Feldberg heads the Team Organization, and Mr Morris Turetzky is chairman of the Men's Division Mr Don R. Hammond has accepted the chairmanship of the Special Gifts Committee for Thompson Township, and Messrs Samuel Roffman and H. J Stern will be chairmen of the Special Gifts Committee for Fallsburgh Township Mr Bernard Keiles, Postmaster of South Fallsburgh, has accepted the chairmanship of the Team Organization for Fallsburgh Township

Mrs Emiliano Gonzalez and Mrs Rose Newman have accepted the cochairmanship of the Women's

Division for Thompson Township

Roslyn Park Hospital, which has been under preparation for the past three years, will finally become a reality for Roslyn and the neighborhood. The hospital site is located on the corner opposite to the Roslyn railroad station

The fifty-bed general hospital, which will be privately owned, and operated by the director, Louis S Bardoly, M D, formerly of Cleveland, Ohio, will be staffed by the neighborhood physicians A board of prominent local citizens with the cooperation of the doctors will govern the hospital

Tentative opening of the hospital is set for the

later part of October, 1945 \*

In a report made by William Blumstein, president of Bronx Hospital, at the recent annual meeting of the institution it was disclosed that a mental hygiene climic will be established as soon as possible, in a broad program based on the development of preventative medicine

A program for the hospital's expansion included a new outpatient department building and the establishment of a diagnostic clinic for people will

moderate incomes

The new departments will all be housed in a no clinic building, to be erected as soon as funds a available and conditions make construction possible. Other departments to be housed in the propose new building will be a nutrition clinic, an auditoring for health lectures, illustrated by demonstration slides, and motion pictures, a rehabilitation clinic with special arrangements for veterans, and facilitie for minor surgical work. The new building would replace the present clinic building, opened in 191 before the hospital itself began service.\*

in Hudson, it was announced on June 5 at a meeting of the building fund committee in Hotel General

Worth, Hudson

Of this amount, \$201,250 has been pledged by the board of trustees and the medical staff of Hudson City Hospital, according to Herman F Zorn, committee chairman

Principal speaker at the meeting was Raymond P Sloan, editor of Modern Hospital William Graves, president of the board of trustees of Hudson City Hospital, presided and the Rev John A McCarthy, of St Mary's Church, gave the invocation
The committee envisions the construction of a

million-dollar hospital as a postwar project
Serving on the committee with Mr Zorn are Dr
John L Edwards, Dr Caldwell B Esselstyn, William H Graves, Dr Rosslyn P Harris, L Proseus
Hover, Mrs George C Inman, James E Leath, J
Wessel TenBroeck, and Mrs John S Williams \*

After inspection last year by Dr J M Westmoreland, of the American Medical Association, and later by Dr Charles Sprague, of the American College of Surgeons, the Wyoming County Community Hospital was fully approved and permission was granted for the employment of resident physicians and Navy needs have taken all available residents up to the present time

In May, however, the War Production Board allotted three young men who have completed internships, for residencies at the hospital, each to have three months in each of the three services of surgery, general medicine, and obstetrics These men are Dr Lyman James Strong, of Emergency Hospital, Buffalo, Dr Rowley, of City Hospital, Syracuse, and Dr Healey, of Charity Hospital, Cleveland. They began on July 1 \*

Buffalo Niagara Electric Corporation and Niagara, Lockport, and Ontario Power Company have jointly subscribed \$24,000 to the \$4,000,000 fund for the enlargement and improvement of Buffalo General Hospital, it was reported on May 27 by Henry W Wendt, chairman of the committee on corporation subscriptions

The subscription of the companies will provide the nose and throat clinic in the enlarged and reconstructed hospital, and is made "in the interest of the companies' employees and their families".\*

Buffalo General Hospital's proposed \$4,000,000 postwar expansion program will provide adequate space, staff, and equipment for the continued study, diagnosis, and treatment of one of the major medical problems of this area, glandular disturbances

Dr Arthur J Reissig, of the hospital's outpatient endocrine clinic, on May 16 emphasized the need for an institution where study of the diseases of the endocrine glands can be carried on. Buffalo, lying in the "goiter belt," has many cases of thyroid disorder, he noted

"At the endocrine clinic all types of endocrine diseases are sought," Dr Reissig explained "Many tests, chemical studies, and x-ray investigations are required to differentiate thyroid, pituitary, parathyroid, and adrenal disorders from each other and from nervous or other diseases resembling them When the correct diagnosis has been made, striking improvement can be obtained in some instances"

Members of the Buffalo General Hospital Medical Staff have pledged \$400,000, the first contribution announced in the \$4,000,000 campaign to enlarge and improve the institution, General Chairman Carlton P Cooke announced on May 17

Agreeing to pool their subscriptions, individual staff members already have subscribed a substantial part of the goal, according to Dr Earl D Osborne,

committee chairman in clinrge of the project

"It can hardly be denied that physicians who are members of the staff, and those whose patients rely largely on General Hospital for their care, are best equipped to understand the need for additional hospital protection in this area," declared Chairman Cooke

"Their decision to assume such a large share of the fund is characteristic of their goodwill, which has long been manifest through the professional care of patients at Buffalo General and as members of the faculty of the medical school of the University of Buffalo"\*

Three of Ossining's banking institutions have given a total of \$10,500 in memorial subscriptions for the construction of units in the enlarged Ossining Hospital, Walter L Johnson, hospital president and chairman of the \$300,000 building fund campaign, announced on May 22

"The committee is greatly pleased to tell the i dents of this area about these subscriptions,"

Johnson said "Our banks are an integral par Johnson said community living, and in responding so readily help solve our community hospital problem, t once again demonstrate how well placed is the trust in which they are held "

Two nurses' stations and one of the two nurse on the maternity floor of the new wing will be m possible by the banks' action The Ossining Ti Company and the First National Bank each scribed \$1,500 for nurses' stations The Bank Savings subscribed \$7,500, the cost of a gl enclosed nursery for newborn citizens of the Ossir area

Other subscriptions amounting to \$6,700 h been received from Ossiming residents, Mr John also revealed. Mr and Mrs Pierpont V Da who subscribed \$2,500, have not as yet designs the special unit of the hospital they wish to me

rialize.

Another gift, totalling \$1,500, has been made Mr and Mrs William Cecil for the examinal room in the expanded nursery department and Mrs Wilham J Yates have subscribed \$1, for an isolation ward on the first floor of the i

## for MATERIAL DIFFERENCE

Supple—but tough! Supple to yield where shoes would otherwise plach, tough to stand up where shoes would otherwise lose shepe and weaken in the support they should provide. That is the "material difference in Pediforms footwear."

Like the strength of the proverbial chain—a shoe is only as strong as it s weakest stitch. While some restrictions have been placed on the manufacturing of shoes—there is no ban on quality or workmanship. Doctors can still rely on Pediforms a strict obsarvance of what the medical profession expects of the footwear they prescribe And that's the 'material difference tool

# Woman's Auxiliary

## To the Medical Society of the State of New York

### Letter from the President

Dear Auxiliary Members,

At the Spring Board meeting of the Woman's Auxiliary to the Medical Society of the State of New York I became your President

It is with a serious feeling of responsibility that I greet you, and hope that I may in some small way be able to follow the glorious example left to me by Mrs Carlton E Wertz, better known to us as "Betty"

Do you realize that in the Spring of 1946 we shall have reached the mature age of ten years-I hope V-J day shall have come and as we gather to cut the cake and talk over past achievements we will be ready for any or all tasks which the State Medical Society may have in store for us

I shall be most happy to hear from you at any time, to help you, always mindful of our parent body, the Medical Society of the State of New York, advising us upon all our activities

May I wish you all a very happy Summer, 1

hope to see you all early in the Fall

Sincerely,

MRS EDWIN A GRIFFIN

### County News

Broome County The May meeting of the Woman's Auxiliary to the Broome County Medical Society was held in Endicott at the home of Mrs Frank G Moore.

Mrs Manual M Monserrate, president of the auxiliary, presided at the business meeting, after which Mrs John H Robertson reviewed the book, "Chedworth," by R C Sherriff

Refreshments were served from a table with a center arrangement of pink and white sweet peas flanked by pink and white tapers Mrs Mark Welch and Mrs Monserrate presided at the tea table

Nassau County. The Woman's Auxiliary to the Nassau County Medical Society elected the follow-ing officers at its annual meeting held on May 22 in the Nassau Hospital auditorium president, Mrs Louis A Van Kleeck, president-elect, Mrs Nathaniel H Robbin, vice-presidents, Mrs E Freeman Miller and Mrs John Neubert, treasurer, Mrs George E Christmann, assistant treasurer, Mrs Austin Johnson, corresponding secretary, Mrs William Bartells, recording secretary, Mrs H S McCartney, and assistant recording secretary, Mrs Thomas Evers

As a result of a dessert bridge held on June 12 at the Engineers' Club in Roslyn the Auxiliary has contributed a substantial sum to the Physician's Home fund. This fund, state-sponsored, is designed to provide suitable living accommodations to ciderly physicians or their widows, whom circumstances deprive of personal resources. The auxiliary has

made an annual contribution to this project

Mrs John L Neubert, chairm an of the bridge,
was assisted by Mrs Louis A Van Kleeck and a
committee composed of Mrs R R Galione, Mrs
Arthur C Martin, Mrs George E Christmann, Mrs William G Burke, Mrs Thomas C Evers, and Mrs Michael J Dunne Table prizes were handkerchiefs, and there were many special awards

Mrs Van Kleeck entertained the executive board at a luncheon on June 20 when plans for the ten

which will close the season's activities were made
Oneida County The Woman's Auxiliary to the
Medical Society of the County of Oneida lield its
annual meeting on May 8 at the Yahnundasis Golf Club, New Hartford, with thirty-five members at-

Following the annual luncheon the business meeting, presided over by Mrs Bradford Golly, of Rome, was held, and officers for the coming year

were elected

Mrs Bradford Golly was re-elected president. The other officers are vice-president, Mrs Philip Turner, second vice-president, Mrs William Mernman, secretary, Mrs F Valone, recording secretary, Mrs R Hurd, treasurer, Mrs H Webb, historian, Mrs R C Hall, and directors for three years, Miss Helen Mellen and Mrs H M Mitchell It was also verted upon to purchase a \$50 war

It was also voted upon to purchase a \$50 war bond and to donate \$25 to the Red Cross During the year, twenty-nine members enrolled to make hospital supplies every Thursday afternoon at Rhoads Hospital, Utica From February 15 to May I, inclusive, six hundred hours have been devoted to that project

The next meeting will be held in October
Warren County The Woman's Auxiliary to the
Medical Society of the County of Warren held its
only meeting of the 1944-1945 senson on May 24 at
the Queensbury Hotel, Glens Falls A lumcheon preceded the meeting and election of officers folloned the reading of the annual reports

Mrs Lyman I Thayer was elected president for the coming year Other new officers are vice-president, Mrs John M Griffin, treasurer, Mrs John A Bannon, recording secretaries, Mrs Hilton H Dier and Mrs Leonard A Hulsebosch

Mrs Burke Diefendorf, president during the past

year, presided at the meeting

in our State, with no law at all to license chiropractors, the reverse proportion holds true and that

there are 7,000 chiropractors

Again, in '1937, Michigan passed a law similar to Washingtons, at that time Michigan had licensed more than 1,300 chiropractors Now, in New York State with a population approximately three times greater than Michigan, we might conclude that there are at least three times as many, or 5,000, chiropractors The exact figure is not known, but 5,000 is the lowest possible number that we should consider, this being exclusive of other cults

The Medical Practice Act in our State, after thirty years, has failed to curb their growth erally, to prosecute illegal practitioners meets with failure, the causes for this are several—the main being the obtaining of evidence, and second, the fact that no injunction can be obtained against

t.hem

Chiropractic as legalized in forty-four states claims for its dogma of the art of healing that disease is caused by some displacement of vertebra, resulting in nerve interference. It rejects all the sulting in nerve interference known facts of modern medical science, including As men of science, the medical probacteriology fession considers this cult a fraud and as nothing but the remnants of the charlatans of the nineteenth century Evidence of this is to be found in the fact that seventeen states plus the District of Columbia, states where chiropractors were already licensed, have passed similar laws which demand of this group as well as other systems of healing, such as M D 's, osteopaths, and dentists, the fundamental knowledge necessary to understand the human body The result of these laws is that chiropractic will be extinct in those states by 1960

In the interest of public health no system of healing should be licensed unless its practitioners possess that knowledge of the human body fundamental to any system of healing Those subjects are anatomy, physiology, pathology, bacteriology, physiologic chemistry, hygiene, and diagnosis. In view of the experience of the eighteen states and in the light of modern medical knowledge it is evident that chiropractic lacks scientific truth and therefore should not now or ever be licensed in New York

State

The proponents of chiropractic make the statement that when the Medical Practice Act was passed many undesirables were licensed as physicians, and therefore all chiropractors should be licensed now while in the future their standards should be so raised as to include the basic sciences

This argument does not hold and has no parallel

to the present, for

At the time there were no standards established by law which regulated the practice of medicine

The art of healing was not the exact science then that it is today

Medical science at that time could show positive progress based on scientific facts and was not based on the say-so of lay individuals, as is the case today for chiropractors

The fact that in eighteen states the Basic Science Law has existed since 1925, and that chiropractic will not exist there by 1960 shows that this group lacks scientific basis or truth for its existence and whatever good they may occasionally do is acci-

The fact remains that New York State is the dumping ground of many illegal practitioners and

in the interest of public health a new law is neces-

sary to eliminate this menace A basic Science Law somewhat like those passed by these eighteen states is the solution. This provides that those systems of healing whose practitioners are now licensed and any others who may be licensed in the future must possess as a prerequisite before seeking licensure from their respective boards a knowledge of anatomy, pathology, bacterology, physiology, chemistry, hygiene, and diagnosis Such a law would introduce a new term on the statute books, "practicing healing," or the "art of healing" and would include medicine, osteopathy, dentistry, and any other system of healing whose practitioners may be licensed in the future. This term is so defined that it lends itself to a greater interpretation than does the term 'Practice of Medicine' The preliminary requirements to study the basic sciences could be made similar to those demanded by our present laws, as it would apply only to those already licensed quently, a Basic Science Law in New York State would be superior to what it has been possible to have in forty-four other states where such a law must require low standards so as not to be declared unconstitutional on the grounds that it was discriminatory against a group (chiropractors) whose educational attainments are known to be low There would also be established a Basic Science Board composed of five men, not in active practice and engaged in teaching the basic sciences in the universities of our State, whose duty it would be to examine applicants and to issue a Certificate of Proficiency in the basic sciences which would be a prerequisite for further study and for appearing before any particular board for examination prior to being licensed

Such a law would shift the burden of proof from the law-enforcement agent to the person who holds himself qualified to treat the sick and would make possible the issue of injunctions, a thing that is not

possible today

The experience of the eighteen states in which a Basic Science law exists has been excellent. A report submitted to us by the Minnesota State Medical Society dated 1938 shows that "Before the advent of this law the number of chiropractors yearly licensed averaged forty Since the passage of the law (1927) the number licensed has averaged two Since the passage of the At the time the Basic Science Law was passed there were 400 odd chiropractors licensed to practice. After ten years this number has dropped to approximately 250"

I am sure that we, as physicians, will appreciate the value of such a law, and we hope that we, in our State, will close the barn door before the horse 18 stolen and that we do not do as other States have done, and as three other states are now contemplating doing, of closing the barn door after the horse is stolen

We trust that in view of the above, and in the public interest, we will have initiated a measure as outlined above to eliminate this menace to public

> CHARLES GULLO, M.D 24 Murray Street Mt Morris, New York March 27, 1945

Note —Attention is called to the fact that the House of Delegates, at the 1944 Session, after a full discussion of the matter, specifically disapproved the principle of a babic science law —Edilor

#### REVIEWED

The Sick African A Clinical Study By M Gelfand, M B Octavo of 373 pages, illustrated Cape Town, S A, Stewart Printing Co, 1944 Cloth, 25/-

The Sick African is not likely to be much read by Americans, yet all of it is interesting and some of it valuable

The body of the volume is devoted to a study which seems to be sketchy but which is, no doubt, adequate of the most common illnesses found among natives in Africa. The discussions are brief but practical and intelligent, and the photographs are noteworthy

The chapter on "The Patient" is easily the most valuable for Americans, especially those who are called upon to treat the medically backward peoples. There are invaluable suggestions on history taking and routine management of disease among such peoples. There are important notes on the incidence and distribution of disease in Africa, and one learns, with some surprise, that illnesses such as rheumatic fever are not at all uncommon in the jungle.

MILTON PLOTZ

Malaria Its Diagnosis, Treatment and Prophylaxis By Col William N Bispham, M D, USA, Retired Octavo of 197 pages, illustrated Baltimore, Williams & Wilkins Co., 1944 Cloth, \$3 50

Designed as a clinical treatise, this book presents a timely discussion of a subject in which all doctors, regardless of locality, will be interested. Its greatest value will be to those stationed in areas in which malaria abounds. However, with the shift in population and the return of members of the armed forces all physicians will have to consider malaria to a greater or lesser extent in their work.

Symptomatology, complications, diagnosis, pathology, and treatment are dealt with in detail with a special chapter devoted to blackwater fever. The preventive aspects are especially well-handled, and there is an excellent chapter on the prevention and treatment of malaria in West Africa which can serve as a model for those stationed in endemic areas.

The author does not hestate to give his own opinion of various conflicting ideas. This helps make the book very readable even if a reader does not always agree with all the theoretic aspects

This is essentially a practical book. Reflecting experience gained in the field of malaria, it is valuable for its detailed evaluation of treatment and prevention

VICTOR GROVER

Rebel Without a Cause The Hypnoanalysis of a Criminal Psychopath. By Robert M Lindner, Ph.D Octavo of 296 pages New York, Grune & Stratton, Inc., 1944 Cloth, \$4.00

[Continued on page 1594]

# Your Ulcer Patients Have Headaches Too

Have you hesitated to prescribe a salicylate for your ulcer patients? A new, superior analgasic will do much to make salicylate therapy practical for them PRO DOL widely used as a general analgesic, is especially preferred for patients who cannot tolerate ordinary aspirin

PRO-DOL's wider range is due to incorporation of 5 grains of acetylsalicylic acid with 71/2 grains of dried aluminum hydroxide gel in each full dosa Irritating acids, which split off ordinary aspirin, are neutralized and adsorbed as they form in the stomach. A unique process insulates salicylate from gal within each tablet until used, prevanting decomposition

DOSAGE: 1 or 2 tablets repeated as required. Boxes of 24 and 60 flavored tablets.

FREDERICK W SEWARD, M. D., Director FREDERICK T SEWARD, M. D., Resident Physician CLARENCE A. POTTER, M. D., Ruident Physician

[Continued from page 1592]

The importance of psychiatry has recently been stressed because of the many neuropsychotic casualties in the war Considerable progress has been made in the understanding and treatment of psychoses as well as neuroses However, constitutional psychopathic inferiority has received but relatively little attention This behavior disorder is socially more serious than either the psychoses or the neuroses, for it has a strong social implication. The psychopath is really excommunicated from socially acceptable goals and in his lack of inhibitions he not infrequently causes a good deal of harm to many with whom he comes into contact Many of these psychopaths will be found in the various groups comprising the different isms, such as the Nazis and the Fascists The horrible crimes committed by the Nazis on their conquered subjects can best be explained by the plans and deeds of their psycho-pathic leaders. Many of the seditious groups which have recently held the attention of our own people are led by psychopaths. Relatively little has been done to evaluate the physiologic and biologic implications of the psychopathic behavior of these groups Therefore, this book is a very timely and important contribution, for it deals with the analysis of the mechanisms of a psychopath who has been thoroughly studied by Dr Lindner and surveyed under the most favorable circumstances. The author has taken that which he felt was best in psychoanalysis and hypnosis and has employed a technic of his own which he calls "hypnoanalysis"

This book is a positive and valuable contribution to psychiatry and should have a very wide circulation among not only psychiatrists but all intelligent

people It is highly recommended

IRVING J SANDS

A Laboratory Manual of Physiological Chemistry By D Wright Wilson Fifth edition Octavo of 269 pages Baltimore, Williams & Wilkins Co, 1944 Cloth, \$2 50

The fifth edition of this laboratory manual of physiologic chemistry has been carefully revised and numerous changes made throughout. It consists of two parts. The first part deals with qualitative and quantitative analysis of inorganic constituents such as phosphorus, calcium, magnesium, sulfur, carbon, and nitrogen. There are also chapters on electrolytic dissociation, colloids, alcohols, carbohydrates, proteins, and fats. The second part describes experiments which furnish knowledge and experience in biochemical technic on such material as saliva, gastric and duodenal juices, milk, blood, bone, muscle, bile, and urine. Experiments on the cell nucleus, metabolism, and dietary deficiencies are included in the text. On the whole, the subject is presented in a clear and concise manner.

EDWARD N NIDISHO

Foster Home Care for Mental Patients By Hester B Crutcher Octavo of 199 pages New York, The Commonwealth Fund, 1944 Cloth, \$2.00

This form of treatment, which has been accepted in European countries for many years, was officially put into operation in New York State in 1935. It provides for the care of carefully selected patients outside the hospital by families other than their own. It is contended that this form of treatment would release space in state hospitals for other patients, it provides care for the patient at lower

cost than hospital maintenance, and a large proportion of patients so placed make a relatively perma-

nent and satisfactory adjustment

Miss Crutcher, who has had a great deal of experence in the state liospitals of New York, made an exhaustive study of this method of treatment before the war. She is convinced that the mental casualties of this war will more than tax the available facilities and that serious consideration must be given to the foster care of mental patients.

The book is well-written and the facts which are

presented are easily assimilated

JOSEPH L ABRAMSON

The Art of Anaesthesia By Paluel J Flagg, M D Seventh edition Octavo of 519 pages, illustrated Philadelphia, J B Lippincott Co., 1944 Cloth, \$6.00

This is a valuable book for all first-aid services in military, industrial, and medical fields. It discusses the physiology of the vital functions of respiration and circulation, describes the pathologic effects of asphyxia, and shows how to prevent and relieve its

disastrous presence

The whole secret in the control of asphyxia is the patency of the upper air passages. The author stresses artificial respiration by the two commonly accepted methods and with this the introduction of an intratracheal tube through the larynx. Suction through the tube is required in cases in which fluids have collected in the air passages. Circulatory stimulation is secondary, the primary consideration is always restitution of the respiration with satisfactory oxygen intake.

All first-aid workers in any calling which involves the danger of suffocation should study this book or at least have it handy for reference in case of emer-

gency

G W Tong

History of Gynecology By Richard A Leonardo, M D Octavo of 434 pages, illustrated New York, Froben Press, 1944 Cloth, \$3 00

A compilation of data on the progress of gynecology throughout the ages, the discussion in this book is, for the most part, concerned with concepts, treatments, and operative procedures. The bibliography is fairly large and twenty-five illustrations are grouped at the end of the book.

Neither the selection of material intended to show the progress made in the modern era nor the method of its presentation meets with the approval of the

reviewer

CHARLES A GORDON,

The Diagnosis and Treatment of Acute Medical Disorders By Francis D Murphy, M D Octavo of 503 pages, illustrated Philadelphia, F A Davis Co, 1944 Cloth, \$6 00

The author has called upon his experiences to set down the essentials of diagnosis and treatment of acute medical disorders in a simple, terse manner. The acute complications of a largo number of chronic diseases have been included. There are no references or bibliography

It is unfortunate that publication was not delayed until the author's experience with penicillin could have been included. It is mentioned only once Many internists will question the preference given sulfamiliamide and sulfapyridine over other sulfon-

amides

# OCAL

Current literature continues to report on the use of Procaine Hydrochloride as a local anesthetic.

In the removal of moles, ordinary seborrheica and senile keratoses from the body, the area is first anesthetized with procaine hydrochloride (A Benson Cannon, N Y S J M, Vol 40, No 21, p 1569)

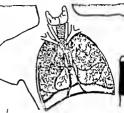

As less toxic than most cocaine substitutes it is especially safe for the production of spinal anesthesia lts continued use for infiltration anesthesia, conduction anesthesia, for topical use in ophthalmology, in rhino-laryngology and for urethral anesthesia finds it still indispensable to the doctor

> Supplied in 2 per cent solution in ampules of 2 cc. and 30 cc.

#### In the Pneumonias

DURING the recent past, numerous investigations have shown that penicillin is the treatment of choice in the pneumonias (pneumococcic, streptococcic, staphylococcic). Penicillin is virtually nontoric, even in the massive dosages at times required. Its efficacy apparently is the same against sulfonamide-resistant and nonresistant organisms of the groups named. Even in advanced stages of the disease, in the presence of serious complications, penicillin usually proves a life saving measure.

Since penicillin has become available in quantities that may well be adequate for all needs, it ments being the physician s first thought with every pneumonia patient

\*Stainsby W J Foss H L., and Drumheller J F Clinical Experiences with Pealcillin Pennsylvania M J 48 119 (Nov.) 1944

Larsen, N.P. Observations with Penicil In Hawaii M. J. 3 272 (July Aug.) 1944.

#### PENICILLIN-C. S. C.

Peniciliin-C.S C deserves the physician's preference not only in the pneumonias, but whenever penicillin therapy is indicated Rigid laboratory control in its manufacture, and bacteriologic and biologic assays, safeguard its potency, sterility, nontoxicity, and freedom from pyrogens. The state of purification reached in Penicillin-C.S.C. is indicated by the notably small amount of substance required to present 100,000 Oxford Units. Because of this purity, incidence of the undesirable reactions, attributed by many investigators to inadequate purification, is greatly reduced.

### In Congestive Heart Failure

Theobromine-calcium salicylate

Council Accepted

Diuretic and Myocardial Stimulant 71/2 grain tablets and powder Dose 1 to 3 tablets, repeated

### ...FROM NATURE'S STOREHOUSE

Until all members of the B-complex have been isolated, their exact functions ascertained, and human requirements for them determined a product of natural source material which contains all B-factors is the best protective dietary supplement.

HEXA HARRIS is prepared from dried, specially cultured yeast (brewers strain) and extract of corn processed with clostridium aceto-butylicium. No synthetics are added *Tuvo* tablets daily supply more than the minimum daily requirement for thiamine and riboflavin plus all other factors of the B-complex group both the known and those as yet unidentified as they exist in the natural source material.

Triple coating not only assures good taste and ease of swallowing but also protects the vitamin potencies. HEXA HARRIS Natural B-Complex Tablets are easily and effectively assimilated

HARRIS VITAMINS ARE NEVER PROMOTED TO THE PUBLIC

The potentiation of the central action of phenobarbital by the belladonna alkaloids (Friedberg, Arch f exp P & P CLX, 276) renders possible attainment of desired effects with relatively small doses, thus avoiding hang over' and other unpleasant side-actions. In contrast to galenical preparations of belladonna, such as the tincture, Belbarb bas always the same proportion of the alkaloids.

Indications Neuroses, migraine, functional digestive and circulatory disturbances, vomiting of pregnancy, menopausal disturbances, hypertension, etc

Formula Each tablet contains 1/2 grain phenobarbital and the three chief alkaloids, equivalent approximately to 8 minims of tincture of belladonna

Belbarb No 2 has the same alkaloidal content but 1/2 grain phenobarbital per tablet

# Effective Convenient Economical

THE effectiveness of Mercurochrome has been demonstrated by more than twenty years of extensive clinical use For professional convenience Mercurochrome is supplied in four forms—Aqueous Solution in Applicator Bottles for the treatment of minor wounds, Surgical Solution for preoperative skin disinfection, Tablets and Powder from which solutions of any desired concentration may readily be prepared

# Mercurochrome

(H W & D brand of merbromm, dibromoxymercurifluorescein-sodium)

is economical because stock solutions may be dispensed quickly and at low cost. Stock solutions keep indefinitely

Mercurochrome is antiseptic and relatively non-irritating and non-toxic in wounds

Complete literature will be furnished on request.

#### A NEW TYPE OF TABLET FORMATION

# **Assuring Better Absorption**

#### Each PANOVEM contains

Vitamin A	5000 U.S.P	Units
Vitamin D	1000 U S.P	Units
Thiamine Hydrochloride		5 mg
Riboflavin		3 mg.
Pyridoxine Hydrochloride		1 mg
Calcium Pantothenate		î mg
Madnamide		25 mg.
Ascorbic Acid		75 mg
Natural Mixed Tocopherol	ls	15 mg.

PANOVEMS present adequate potencies of nine important vitamins in an advantageous new type of tablet. The fat soluble vitamins are contained in an enteric-coated inner core, over which the water soluble vitamins are arranged in gelatin-coated layers. The water soluble vitamins are released in the stomach—the fat-soluble vitamins are not released until they reach the small intestine, thus effectively eliminating their tendency to cause regurgitation.

PANOVEMS are fully protected against potency-loss from oxidation, are easily swallowed, and do not give rise to "after taste." One PANOVEM daily is adequate for prophylaxis or for correction of subclinical deficiencies. In frank deficiency states, dosage may be increased in proportion to severity of symptoms. Available in bottles of 100 tablets

#### THE PAUL PLESSNER COMPANY 35 Years of Ethical Service

OPTIMAL SUPPLEMENTATION WITH NINE VITAMINS

# Results with

Response to Ertronization, evidenced by increased motion and muscle strength, decreased swelling, and a generalized systemic improvement, is typical of the findings in large series of reported cases

The results reported are not of a temporary nature, as they are based on observations over a ten-year period

The relief obtained from Ertron, both subjective and objective, is a systemic response—not confined to the joint spaces. Since arthritis has been defined over and over again as a systemic disease, this approach is more than amelioratory. It is treatment of arthritis rather than the patient with arthritis. This latter factor, however, must not be lost

sight of, and when analgesia, psychotherapy and physical therapy measures are indicated, they may and should be employed in conjunction with Ertron therapy

Ertron alone—and no other product—contains electrically activated vaporized ergosterol (Whittier Process)

#### ERTRONIZE THE ARTHRITIC

Ertronize Means Employ Ertron in an adequate daily dosage over a sufficiently long period to produce optimal results Gradually increase the dosage to that recommended or to the toleration level Maintain this dosage until maximum improvement occurs

Supplied in bottles of 50, 100 and 500 capsules Parenteral for Supplementary Intramuscular Injection

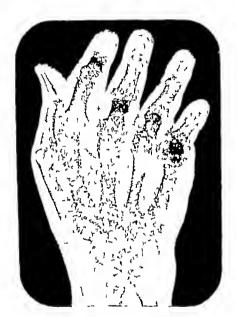

ETHICALLY PROMOTED

#### NUTRITION RESEARCH LABORATORIES . CHICAGO

# **INTERTRON** in Arthritis

Views of the right hand of a male, aged 42 years; illustrating typical atrophic or rheumatoid arthritis duration of disease, 7 years; accupation, laborer

Photographs Illustrate an advanced case of atrophic (rheumatoid) arthritis showing typical spindle or furifarm shoped fingers with blush red discolare thous. The fingers show a marked subluxation involving especially the second interpholangeal joints with posterior dislocation. The characteristic flexion deformities are fixed due to fibrosis and bony ankylosis. The earlier morked soft tissue swelling has largely disappeared at this stage of the disease General involvement cervical spine, and bilateral involvement of the feet ankles knees, elbows and shoulders X-ray of the hand reveals a destructive arthritis of the metacarpals with flexion deformity and ankylosis loss of joint spaces particularly in the distal interpholongeal joints and partial ankylosis.

# A POTENT MEMOSTATI

FOR LOCAL USE

surgeons, highly purified thrombin, nature's own hemostatic, is now available in sufficient quantity to permit us to introduce

# THROMBIN TOPICAL

Acting directly on the fibrinogen of the blood virtually independent of other clothing factors, such as calcium ions, thromboplastin, prothrombin, and viramin K. THROMBIN, TOPICAL (Bovine origin) produces hemostasis in a matter of seconds in the control of capillary bleeding it is applied in solution in isotonic saline, sprayed or flooded over the bleeding surface

As its name indicates, THROMBIN, TOPICAL must not be injected

Parke, Davis & Company
Detroit 32, MICHIGAN

# Indicated therapy in Sequelae of Epidemic Encephalitis

# Pills Stramonium (Davies, Rose)

2½ grains

Physicians in private practice as well as in neurological clinics have widely prescribed these pills since 1929, and their continued interest in and use of them point to the service-ability of this therapy

Stramonium Pills (Davies, Rose) exhibit in each pill 2½ grains of alkaloidally standardized Stramonium (powdered dried leaf and flowering top of Datura Stramonium, USP), equivalent to 25 minims (154 cc) of Tincture USP

As a reassurance of the activity of the finished pills, they, too, are alkaloidally assayed, thus establishing as far as possible uniformity and dependability

A package for clinical trial and literature mailed free of charge upon request

# SODA-BICARBONATE SODA-BICARBONATE NECESSARY IN SALICYLATE THERAPY

Tabless 5 grams, bottles of 50, 250, 1000

To be effective the treatment of acute theumatic fever must maintain a high salitylate level in the blood. When massive doses of sodium salitylate are given by mouth an undestrable stide effect—gastne distress—is frequently encountered. To relieve this effect equal amounts of sodium blearbonate are given. Unfortunately a decided depression of the blood salitylate level results.

Gastric distress and its required relief by sodium bicarbonate are avoided when Salysal is given for Salysal is not soluble in the acid medium of the aconach Furthermore, 100 parts of Salysal provide 124 equivalent parts of sodium salexylate. Thus smaller doses accomplish the same effect.

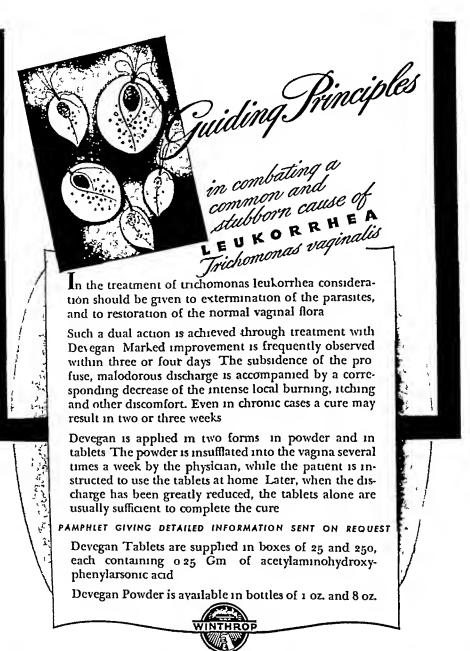

Literature and sample on request

Digitaline Nativelle, the chief ac tive glycoside of digitalis purpures in pure crystilline form fulfills every point demanded by the Couocil on Pharmacy and Chem istry\* for an effective digitalis principle

A potent pure principle which is completely absorbed from the exattrointestinal tract would make it possible to digitalize rapidly by oral administration without the danger of local initaot action of the large amount of nonabsorbable glycosides

NOTE THESE ADVANTAGES

POTENCY Given orally Digitaline Nativelle is 1000 times as potent as USP XII digitalis 1 mg Digitaline Nativelle exerts the ac tion of I Gm digitalis leaf Since it is in pure crystalline form its po tency is uniform. Hence it permits of precise dosage, the same dosage always exerung the same action.

ABSORPTION. It is completely and speedily absorbed probably directly from the stomach. Thus it digitalizes with practically the same speed, whether given orally or by vein.

FEWER SIDE-ACTIONS. Because the average digitalizing dose is so small (1.2 mg) and is so com pietely absorbed oauses and vomiting from local unitant action are almost never encountered

RAPID SINGLE-DOSE DIGITALIZATION. The average digitalizing dose as demonstrated in a series oow ex ceeding 1000 unselected cases, is 12 mg When rapid action is oeeded and in fact whenever de sired this full digitalizing dose may be given at one time and reaches its full effect in 3 to 6 hours. The average daily main tenance dose is 0.2 mg

ADVANTAGES: One tablet of White's Sulfathiazole Gum chewed for one half to one hour

1 promptly provides a high salivary concentration of locally active (dissolved) sulfathiazole

2. that is sustained throughout the chewing period in immediate contact with infected orophary ngeal mucosal surfaces.

3 yet even with maximal dosage, resulting blood levels remain so low as to be virtually negligible. INDICATIONS: Local treatment of sulfonamide susceptible infections of oropharyngeal areas acute tonsillitis and pharyngitis, septic sore throat, m fectious gingivitis and stomatitis, acute Vincent's discaso.

DOSAGE: One tablet chewed for one holf to one hour at intervals of one to four hours depending upon the severity of the condition

If preferred, several tablets—rather than a sin gle tablet-may be chewed SUCCESSIVELY during each dosage period without significantly increas ing the amount of sulfathiazole systemically absorbed

Available in packages of 24 tablets, sanitaped, in slip-sleeve prescription boxes.

IMPORTANT: Please note that your patient requires your prescription to abtain this product from the pharmacist

#### SOVIET GRAMICIDIN

Penicillium notatum and other fungi are not the only kind of microorganism producing a substance highly lethal to other species and capable of use as an It is now nearly ten years since Dubos extracted such a substance from cultures of an aerobic sporogenous bacillus, Bacillus brevis, and called it gramicidin, from its remarkable lethal action on the gram-positive pyogenic cocci stance was later found to contain two elements one to which this action was mainly due, and another, tyrocidine, which also killed gram-negative bacteria and was more toxic to mammalian cells—It is now thought that the two should be used in combination, and such a product is now available commercially under the name of tyrothricin There have been favorable reports on its use as a local antiseptic for a variety of purposes Meanwhile, GF Gause and MG Brazhnikova, of the Institute of Tropical Medicine, Moscow, have examined several hundred strains of aerobic sporogenous bacilli cultivated from Russian soils, and discovered one which produces an antibacterial substance, to be named "gramicidin S" (Soviet gramicidin), which differs from tyrothricin, though it is of similar composition and action. The properties of this substance and its clinical use have now been described in both the American<sup>1</sup> and English<sup>2</sup> medical press Extraction from cultures is a simple process furnishing a high yield of a single readily crystallisable substance, having a much higher melting point (268-270 C) than either constituent of tyrothricin, like these substances it is a polypeptide, but differs in the number and proportion of its amino acids contains a high proportion of leucine—a fact of some interest in that S W Fox, et al \* have been studying isomers of leucine with a view to determining the nature of the action of antibacterial polypeptides. They find that d-leucine inhibits Lactobacillus arabinosus, whereas l-leucine is a factor required for the growth of this organism—a relationship strongly suggestive of the sulfonamide type of effect

Gramicidin S acts on a wide range of bacteria, including gram-negative species, and is very highly active—more so than tyrothricin—against staphylo-Experimentally it has been shown to have a prophylactic action against gas gangrene, it would have been interesting if some other antiscptics had been employed in these tests for comparison Clinically it has been used successfully in both the prophylaxis and treatment of wound infections, and in treating ostcomyelitis, empyema, and certain skin infections. Its toxicity is about equal to that of tyrothricin, which means that it is suitable only for local application, though the injection of a fairly large quantity into a closed cavity, such as an empyema, has evidently no ill effects. Has this kind of biogenic antiseptic any future, assuming that penicillin, which vastly excels it in some of its properties, will soon be freely available? The answer seems to be that it has one certain and one possible advantage over penicillin. The former is its action on gram-negative bacilli (Proteus and Bact coli, no data mentioned for Ps pyocyanea), since against these penicillin is powerless possible advantage is greater local persistence owing to its high degree of insolubility, whether this in fact occurs cannot be deduced from the available information—Brit M J, March 3, 1945

#### Rabies Control

Rabies, one of the most highly fatal discases known to animal and man, has again appeared in New York State Thirteen counties have been certified by the Commissioner of Health to have rables existing among dogs The appearance of this disease in many areas, quiescent for years, raises anew the question of mothods of con-The disease is transmitted almost wholly by carmy orous animals, especially the dog, because these animals naturally attack by means of thoir bite. The dog appears to be the natural host of the rabies While other species contract the disease, the dog appears to be, directly or indirectly, the main disseminator of the virus. Interruption of the cycle of rabies. therefore, involves control of the disease in dogs. It is desirable at this time for all physicians to be familiar with the methods of control and with the importance of the efficient discharge of these mothods, for man, while not highly susceptible to the rables virus, does occasionally develop the disease and is frequently exposed through bite wounds which require vigorous preventive treatment.

How rables may be eradicated has long been known The question which always presents itself is how to apply what we know Here controvers; has led to confusion and lack of cooperation on the part of the public. Most studies of the effectiveness of rabies vaccine in the field have combined impounding or destroying the stray, homeless dogs of the area.1 Which of these procedures coninbuted most to the reduction in incidence of rabies among dogs remains obscure 1939 Webster? found that many phenoltreated vaccines did not protect laboratory anımals Habel\* 4 found wide variability in the protective action of commercial vac-Ho developed what is now known

\* Habel L.: ibid 50 041 (1941)

Johnson Harald: Proc U.S. Live Stock San Assoc 130 (Dec.) 1043.

\* Websier L. T: J Exper Med 70, 87 (1039)

\* Habel L. Pub Health Rep. 55: 1610 (1940)

\* Habel K. fbd. 55: 1473 (1940)

as the "Habel Test" of potency of rabies This test has been adopted as a necessary prerequisite before offering any commercial vaccine for sale in the United Vaccine immunization thus has It becomes clear, received a fresh impetus therefore, that judgment as to the effectiveness of prophylactic vaccine for dogs should take into consideration whether the series reported was before or after the advent of the compulsory Habel Test of potency for commercial vaccines as adopted by the United States Department of Agriculture Vaccines composed of killed virus are now used in preventive treatment for humans, replacing the dried rabbit-cord preparation advocated by Pasteur

Recently Habel, working on the theory that with virus diseases the effectiveness of immune serum ceases once the virus has entered the susceptible cell, has restudied the possibilities of seroprophylaxis through the use of immune serum. A new and improved method for the production and concentration of rabies-immune rabbit serum has been found The protective effects found with laboratory animals warrant a trial, as soon as it becomes available, of immune serum either alone or combined with vaccine, in the prophylaxis of rabies in

Outbreaks of rabies at the turn of the century both in Europe<sup>7</sup> and in this country were effectively stopped by dog-control measures only It seems logical to assume that if both dog-control measures and vaccination of dogs were brought about, the present outbreak would abate promptly

Article 3 of the Public Health Law, with the amendment which became effective April 2, 1945,8 clearly outlines the responsibility of both doctor and layman in the prevention of the spread of rabies in counties certified as having rabies by the Health Commissioner What about the counties not certified, but in the direct path of the infection? Here the physician can be of great help to the cause Because sounder

and other preventable infections? Physicians should be familiar with diagn tic and treatment procedures plans of control are possible before the disserved and observed for symptoms 4 Habel, K Pub Health Rep 60 545 (1945) A New York State J Med 9 41 (Feb.)

ease strikes, it is advisable that communit now free, but near infested areas, set control measures early 9 These will met with resistance by the dog-owner pi lic, however, history has shown that co trol is absolutely essential Modern vi cines will no doubt decrease the susceptif ity of the dogs vaccinated, but the stra homeless dog does not receive vaccine a becomes a focal point of danger to be animals and children because of the ter ency of the rabid dog to travel many mi before death ends the struggle Therefore voluntary community council at cour level for rabies control, set up well ahe of the actual time when the Local Board Health takes over by law, seems desirah Such a council could consist of a vetern ian, a local health officer, the district sta health officer, a dog owner enjoying put confidence, and a representative of t board of supervisors This council shor be responsible for public education regain ing measures of control and immunization should provide for vaccine prophylaxis dogs through the veternarians of the cour at a nominal fee, should instruct the pub concerning their responsibility in reporti immediately all animal-bite wounds to th physician or health officer so that wour may be promptly treated, and should: struct the public to confine under compete veterinary supervision every suspected de especially those known to have bitt animal or man If such a council exist and functioned in each county, perior outbreaks in neighboring counties would i spread Waiting until the first case ! pears before alerting an area results in 1 necessary emotional activity on the part the public—yet the law cannot take he until the area is "certified" How would we have gone if the same formula h been applied to the control of typhoid fer

should be thoroughly cleaned and caut ized immediately The dog should be p has been demonstrated that the virus m be in the saliva a few days before sympton

<sup>7</sup> Moore, V A I Laws of New York, Chap 414, Public Health Law, 1945

<sup>&</sup>lt;sup>9</sup> Zeissig, A Veterinary News 8 3, 6 (April) 1945

dovclop 10 Negri bodies are demonstrated more frequently in the brain cells of animals late in the disease. If the bite is around the head, it is well to proceed with prophylactic treatment immediately. If superficial or in an extremity, one is justified in waiting for diagnosis. But, here again, reports may be confusing. The diagnostic laboratory to which the head is sent may be able to report positive lieads immediately

<sup>10</sup> Schoening H W Nearbook of Agriculture Washing ton D C. Oovt Printing Office 1942 p. 1113. If Negri bodies are found in the impression smear. If these are negative, fixed sections are made. If the sections are negative, injection of susceptible mice may require two weeks before a definite opinion can be had. The decision for prophylactic treatment of a person bitten on the face or under susplicious circumstances cannot wait for a positive laboratory diagnosis. Experimental morbidity curves show the danger of deliay and therefore the physician may be called upon to make a decision on circumstances plane.

#### That Bill Is In Again

The power to tax is the power to destroy Messers Wagner, Murray, and Dingell bave once again introduced into the Congress of the United States, where it has been referred to the Committee on Finance, S 1050, a bill to "provide for the national security, health, and public welfare" This bill seems to be as good an example of Justice Taney's axiom as any we have yet seen, and far more expensive than last year's comparatively tunid attempt by the same authors to extend social security benefits

We think it is time to examine what can be destroyed by the power to tax. Primarly, the initiative of private enterprise is undermined by fear of the unbridled and reckless exercise of the power to tax, secondarily, the sources of tax revenues are dried up when profits cease to exist. Of the bill the New York Times says in part

"The measures would establish a national social insurance system consisting of prepaid personal health service, unemployment and temporary disability insurance benefits up to \$30 a week on a uniform national basis, and retirement, survivors, and total disability insurance with more liberal benefits than in existing law. They would provide grants to States for expansion of health services, maternity and child health and welfare services. They would in augurate a program of Federal grants and loans for construction and expansion of beepitals and bealth centers. They would extend the coverage of the social insurance system to an esti-

1 May 26, 1945.

nated 15,000,000 additional persons—farm and domestic workers, employes of nonprofit institutions, independent farmers, professional persons, and small business men

"It is a central aim of social progress to mitigate the hazards of unemployment, need, sickness, disability, and old age for the individual Every stop is to be welcomed by which this can be done without itself introducing equal or greater hazard. This indicates the questions to be asked of a proposal like the Wagner-Murray-Dingell bill Will it provide relief where it is not needed? Will it mitigate the penalties for failure or misfortune without weakening the incentives to production and success? Will it provide aid to individuals without making them politically dependent and without dangerously extending the power of the central Government?

"Under the bill as it stands it is more than doubtful whether these questions can be answered satisfactorily. Even under the present social security program we face problems for which we have not yet produced adequate answers. You under the new bill wast new programs would be undertaken and existing programs would be tremendously liberalised.

"The Federal government would pay un omployment benefits for twenty-ax weeks (far beyond the average length of time for which such benefits are now paid by the States), and it is oven provided that the duration of benefits may be extended to a maximum total of fifty-two weeks. A schedule is provided, also, under which a worker making when employed an average of \$40 a week could draw as high as \$30 a week unemployment benefit. This schedule is also far above the average of what the States

now pay Would not such payments tempt the creation of the very unemployment they are designed to meet? If a man who can get \$40 a week for working can draw \$30 a week for not working, then so long as he is entitled to draw benefits he is in effect working for only \$10 a week that is the way many will naturally look at the matter when they are asked to take a job, or when they consider giving themselves a vacation at Government expense

No one can accuse the New York Times of holding a brief for reaction to real social progress. Nor does this Journal oppose rational liberalization of existing medical and social theory and practice, but to us there seems to be more than a little reminiscent of the Mississippi Bubble psychology in this most recent promotion of Messers Wagner, Murray, and Dingell Says the Times further

"A question must be raised about the total costs of this bill, which its sponsors seem to treat so lightly. An 8 per cent tax on payrolls (4 per cent to be paid by workers and 4 per cent by employers) is in itself an extremely high tax. It is a direct tax on employment. Hence it tends to discourage employment, the very thing upon which our whole welfare and prosperity, including the success of social security plans, must depend. Yet there are strong reasons for thinking that the sponsors of this bill have

greatly underestimated the cost of their measure, and that this 8 per cent tax would not be nearly adequate, after a few years, for what they propose

"The tremendous financial commitment involved in the Wagner-Murray-Dingell bill ought to involve the most careful study, even in a period when the budget is balanced and on a relatively manageable level. To undertake it lightly at the present time, when the budget is already unbalanced to an unparalleled extent by war, and when the path back to balance and manageability is already far from clear, would be an assumption of obligations without considering how they are to be paid."

We recommend to the authors of this legislation the perusal of Mr Aesop's fable of the "Goose that Laid the Golden Egg". It seems to have more than a little applicability in the piemises

Exhaustive examination and debate of this bill in the light of the unsolved problems of the present social security program will probably disclose its potentially inflationary character in view of the fact that no effective ceilings have been placed on wages for political reasons. Ten years is a long way to look ahead. And whether for one year, five, or ten, the unwise use of the power to tax, from whatever motives, is still the power to destroy.

#### Current Editorial Comment

#### Of This and That

HR 1391, a bill to establish a Department of National Health, was introduced on January 11, 1945, in the House of Representatives by the Hon A L Miller of the Fourth District, Nebraska

The bill provides for a secretary of Cabinet rank

It appears that there are now in the national government some thirty-two federal agencies dealing with various phases of health

Dr Miller is of the opinion that a Secretary of National Health might consolidate

some and eliminate others of the overlap-

ping activities of these agencies

The idea appears to be sound Some such action was first called for about thirty-seven years ago by the AMA, if memory serves us correctly The present bill has been referred to the Committee on Expenditures in the Executive Departments We should like to see it reported favorably. It would doubtless be of assistance to Dr Miller to have those physicians who approve the bill write to him saying so. It is a move in the right direction.

#### THIOURACIL A REVIEW OF ITS CLINICAL INDICATIONS

GROSVENOR W BISSELL, M D Buffalo, New York

(From the Department of Medicine University of Buffalo School of Medicine and the Edward J Meyer Memorial Hospital)

R ECENTLY, several observers reported the production of gotters, accompanied by hypometabolism, in animals treated with certain sulfonamides and dorivatives of thiourea 1-1 These substances were found to interfere with the synthesis of thyroid bormono Thoy had no effect on the action of preformed thyrold hormone, however The goltrogenic notion was believed due to pituitury overstimulation, for pituitectomy abelished the effect. The gortrogenie and hypometabolic action could likewise be presented by the concomitant administration of thyroun but not by rodino or duodotyrosine 1.8 Thiouracil (2-thio, 0-oxypyrimidine) was found to be the most active drug in producing these effects. Astwood applied this drug clinically in the treatment of human thyrotoxicosis and observed a lowering of the basal heat production, gain in weight, and restoration of the patient to clinical normalcy, following its use 16 These observations were confirmed by Williams and his coworkers, who found also that the pretein-bound indine level of the blood was restored to normal 11 Since then the efficiency of thlouracil in controlling the symptoms of hyperthyroldism has been abundantly confirmed.12-29 The effect of thiouracil seems preferable to rodine in that its action is sustained and progressive. The drug has been used successfully both as n preoperative agent16-16 and as an entirely medical therapy for thyrotoricosis 13-15 Thiouracil has proved successful in controlling cases in which iodino failed to alleviate the symptoms

Notwithstanding the brilliant results attending the use of thiournal, it has proved a somewhat toxic agent Agranulocytosis and leukopenia have followed its use 18-13-14 Occasionally the former complication has been fatal 22-25 Febrile reactions, skin makes, cervical adonopathy, urticaria, arthralgia, hematuria, and transient edema are known to occur 12 Because of this knowledge, some discretion must attend the use of the drug

It is the primary purpose of this paper to consider the indications in which we believe thiournel to be the best available agent for the centrel of thyrotoxicosis. We do not wish to imply that these indications necessarily constitute a basis for the general substitution of thiournell for sur-

gery Wo shall also indicate certain general precautions to be observed in the use of this powerful infitthyroid drug. The opinions which we express are based on our personal experience with the drug, which started in 1943 in Dr. Robert II Williams' laboratory at the Thoradako Memorial Laboratory. This experience is continuing at present in our own clinic.

#### Inducations for the Use of Thiougacil

1 Uncomplicated Hyperthyroidism—Mild thyrotoxicosis is easily controlled with thlouracil, but since such cases usually respond equally well to todine, thiouracil probably offers little advantage in their treatment. The possibility of a toxic reaction to thiouracil may even constitute an indication for the use of todine in such cases

It is our considered opinion that severe hyperthyroidism, whother necompanying a nodular or a diffuse hyperplastic gotter, is best treated with thiouracil This judgment is based on sayeral facts (a) The action of thiouracil is predictable and sustained If the treatment is con tinued for sufficient time the clinical state of the patient and the basal expres consumption will become normal There is no chance of a refractory state developing comparable to loding fest-(b) The response to thlouracil is rapid in severe cases.10 \*\* Within three to five weeks one may expect the patient's return to clinical normalcy accompanied by weight gain and a normal basal metabolle rate. The adenomatous golter may be expected to be slower than the diffuse byperplastic gland in its response to therapy (c) Thiouracil is a more dependable preoperative medication than loding. When thiournell is being used as a preoperative agent, the surgeon may safely wait until the patient's clinical status and basal metabolic rate are normal before attempting the operation. Often, with the use of iodino, the surgeon is compelled to operate nt such time as ho believes the patient has the hencfit of the full lodino effect, even if the clinical state and basal heat production are still abnormal (d) Thiouracil insures a smooth postoperative course. Since thiournal interferes with the production of thyroid hormone, we believe that its preoperative use probably safeguards against thyroid "storm," the most serious postoperative complication of thyroidectomy Tho operative

Paper prepared for presentation before the Annual Meeting of the Medical Society of the State of New York scheduled for Buffalo, May 1946.

and postoperative course of patients prepared for surgery with thiouracil has been shown to be more satisfactory than those prepared with iodine <sup>22</sup> (e) Thiouracil allows the patient to remain ambulatory Except in the cases of extieme weakness or heart failure, it is not necessary to confine the patient to bed while he is receiving thiouracil. We have allowed many of our cooperative patients to continue their usual occupations (which were often quite strenuous) during therapy, without noting any loss of the drug's therapeutic efficiency. This advantage is often of considerable economic importance to the patient.

- Recurrent Thyrotoxicosis -The exacerba-2 tion of thyrotoxicosis at varying intervals after subtotal thyroidectomy is well recognized Often in such cases both the surgeon and patient are wary of another operation which may likewise prove unsuccessful In such cases thiouracil offers a new and promising form of therapy Should it be decided that a second operation is best avoided the patient may be maintained successfully on thouracil After six to twelve months the drug may be stopped and the permanence of the remission evaluated If not sustained the patient may again be controlled on thiouracil for a further period of time
- 3 Thyrotoxicosis Which Has Not Responded to Iodine—Not infrequently adequate iodine therapy fails to control the hyperthyroid state, or the patient becomes iodine fast, with exacerbation of his symptoms in spite of continued iodine administration. Thiouracil is definitely indicated in such cases. It should be appreciated, however, that such patients will respond more slowly and less dramatically to thiouracil than patients who have had no previous iodine treatment. If thiouracil is administered for a sufficient time the symptoms of the disease will remit in the anticipated manner.
- Thyrocardiacs, Thyroid Cachexia -In certain cases of thyrotoxicosis the metabolic effects have been so severe and uncontrollable that the patient is left a physical and emotional wreck In others, cardiac disease has accompanied the process, resulting in severe and virtually uncontrollable heart failure Heretofore, such cases were probably the most difficult medical-surgical problems in thyroid disease Thiouracil has achieved brilliant results in such instances have seen several patients in whom the use of the drug was life-saving In our opinion the thyrocardiac and the thyrocachectic patient indicate the use of thiournal in preference to other forms of therapy Whether surgery 13 eventually employed in these cases is a matter of consideration and judgment for the physician in view of the circumstances involved

- Thyrotoxicosis Associated with Severe Oculopathy - Certain cases of hyperthyroidism (usually somewhat mild), associated with marked ophthalmoplegia, show marked increase in the eye signs following surgery In such cases we believe that thiournal offers a better type of therapy than does surgery It should be recalled that the eye signs in these cases are probably due to pituitary overstimulation28 which is further increased by thyroidectomy Thiouracil therapy is also accompanied by pituitary overstimulation (supra vide) However, by the appropriate control of the dosage of thiouracil, often accompanied by the use of thyroid extract,30 the oculorathy may be controlled successfully at the same time that the toxicity is being corrected. Since postoperatively these cases may proceed to a state of malignant exophthalmos, we believe that in these selected cases thiournel is a preferable substitute for surgery as the treatment of choice
- 6 Thyrotoxicosis Accompanying Infections, Especially Tuberculosis—Often thyrotoxicosis is precipitated by an acute infection, or develops during a long-standing one. In such instances, especially in tuberculosis, thiouracil offers a successful means of controlling the thyrotoxicosis at a time when surgery may be impossible or inadvisable.
- 7 Thyrotoxicosis Accompanying Pregnancy—
  The avoidance of surgery during pregnancy whenever possible is generally practiced. This would seem to apply especially in those cases of a major surgical manipulation such as thyroidectomy. We'll have successfully treated thyrotoxicosis accompanying pregnancy and are inclined to nominate this therapy as the one of choice. There are no deleterious effects on the infant.
- 8 Thyrotoxicosis in Children—When thyrotoxicosis occurs in children, often it begins around the time of puberty. This may be associated with the increased thyroid activity and mental instability of the period. It has always seemed to us that if the disease were controlled during the period without surgery, it might well remain is remussion with the establishment of the more stable period of adulthood. In mild cases, iodin may successfully achieve this. In more sever cases thiourach may be used effectively in an attempt to avoid surgery at this time.

#### Contraindications to the Use of Thiouraci

1 Nontoxic Goiters—It cannot be empha sized too strongly that thiouracil is of use only in thyrotoxicosis. It has no place in the therap, of any other thyroid condition. It might even make a nontoxic goiter enlarge in size (due to pituitary overstimulation).

2 Cases in Which the Diagnosis Is in Doub! -

Often we are asked to see nationts who exhibit golters and in whom there are some signs indicative of mild hyperthyroidism Often there is accompanying hypertension, menopausal syndrome, or organic heart disease, etc. the exact contribution of which to the patients' symptoms is indeterminato In such cases it is often impossible to tell accurately whether all of the clinical findings are not due to the underlying disease Basal metabolic rate determinations are of little value since they are often somewhat elevated in uncomplicated hypertension, cardiae decomponsation, and anxiety states per se Estimations of the protein-bound iodine might aid in establishing the diagnosis, but these determinations are not generally available

In such instances it is our policy to avoid the use of thiouracil, since we have found that the thyrotoxicosis, if present at all, is adequately controlled with lodine. In these cases in which the existence of thyrotoxicosis is in doubt or is very mild we should rather avoid the use of a drug which may have toxic implications. For the same reason we also disfavor the use of thiouracil as a therapoutto test of hyperthyroidism.

- 3 Other Diseases—Thiouracil has no place in the treatment of those diseases sometimes associated with elevated metabolic rates such as essential hyportension and loukemia. We heartily condemn its use to produce myxedema in cases of heart disease in which the lowering of the basel metabolism is supposed to be of benefit.
- 4 Uncooperative Patients—We refuse to treat uncooperative or Ignorant patients except under strict hospital supervision. We consider such patients poor risks and we have found that their treatment as outpatients often results in the development of a complication of therapy, which we have suspected was due at times to unadmitted overdosage, concomitant use of other toxic drugs, faulty food habits, and the like Even in the hospital we are liesitant to treat individuals who have unbalanced or uncooperative personalities.

#### Precautions in the Use of Thiourscil

Since thiouracil is somewhat toxic, patients receiving the drug must be observed frequently. It is important that the patient understand the necessity of informing his doctor immediately of may unusual symptom not present before therapy. Especially should patients be seen if they complain of sore throats, weakness, or cervical tenderness, which may be the first symptoms of agranulocytosis. White and differential blood cell counts ought be done at frequent intervals

The design originally employed in the chemotherapy of hyperthyroidism was too large. Initially, we now employ 0 4 to 0 6 Gm. in divided doses daily, and reduce this amount progressively as the clinical status of the patient improves. It is felt that there will probably be fower complications with this reduced dosage. We feel also that the maintenance of an indequate dietary high in protein and carbohydrate, and supplemented by the vitamin B complex in some form is of importance in avoiding the complications of therapy.

Frequently the thyroid enlarges to an appreciable degree under theories therapy, and pattents with very large or substernal gotters ought to be watched carefully for obstructive symptoms. In my own experience this has caused no difficulty but should be fully recognized as a possibility. Reduction of desage would probably be adequate to correct the condition

It must be appreciated, also, that exophthalmos may increase somewhat during thiournal ad ministration. Although we believe that certain selected cases with prominent eye signs are best treated with thiournal (aupra ride) every case should be observed for increasing eye signs during therapy. Concomitant administration of thyroid extract\* is usually adequate to control the condition.

#### Discussion

Thiourneal successfully controls the symptoms of thyrotoxicosis. It is superior to lodine in its predictable, reproducible, progressive type of notion. It will control effectively cases in which iodine has had little effect. It is inferior to iodine in that it has a higher incidence of toxic reactions.

The drug has been used for too short n period to allow an adequate evaluation of its final place in therapeutas. However, the hilliant reports attending its use, when all other antithyroid therapy has failed, would seem to assure the permanence of this type of antithyroid drug in the therapy of town gouter.

We wish it understood clearly that we do not atpresent offer this and associated antithyroid drugs as n substitute for surgery in all cases. The toxic nodular golter, whether controlled with thiouracil or iodine, is presumed to be an indication for surgery largely because of the potentiality of pathologic changes. The toxic diffuse golter may be controlled offectively with thiouracil Whether such a gland is removed or antithyrold chemotherapy substituted must be decided by the doctor with the full knowledge of the patient of the slight but recognized possibility of a toxic reaction Numerous patients treated medically have stopped therapy after ax months to one year and have remained in remission. Others have had to resume therapy for longer periods of

We agree with Shorr29 that the completeness

of remission following any form of therapy will depend largely on the continuance or remedy of an unfortunate neuropsychiatric environment in many cases

In certain selected cases we believe that thiouracıl may and ought to be substituted for a sur-These instances are patients gical procedure with thyrocardiac disease, thyroid cachexia, and thyrotoxicosis associated with marked oculopathy. with pregnancy, with infectious disease, and with childhood

Patients receiving thiouracil should have frequent observation by a physician both for the signs of any toxic manifestations, and for evidence of clinical improvement allowing profitable reduction of drug dosage

Thiouracil is a valuable adjunct in the therapy It appears to have certain of thyrotoxicosis definite advantages over iodine as an antithyroid

Should an antithyroid compound be developed which possesses the potency of thiouracil plus the extremely low toxicity of iodine, the day may well be at hand when iodine and surgery may be supplanted in the treatment of thyrotoxicosis except perhaps in the case of the nodular or the Should thiouracil remain as very large gorter the most effective agent, we believe that its place in the treatment of selected cases of hyperthyroidism is assured

#### Conclusions and Summary

Thiouracil is a new antithyroid drug which can effectively control the symptoms of thyro-

Its action appears preferable to iodine, but the toxicity of the drug is considerably higher than iodine Thiouracil may be used as an excellent preoperative agent In certain selected cases it is a preferable substitute for surgery in the treatment of thyrotoxicosis

#### THE BROTHERHOOD OF MEDICAL MEN

In striking contrast to the hundreds of atrocity stones which have come out of the war is an item carried by the United Press during the German Similar stories have grown out of break-through almost every war within the memory of man, and to the credit of medical men everywhere, it is highly probable that they are all true

The UP dispatch tells how an American medical unit, captured by the Germans, worked for two days side by side with German medical men "The story began when a force of German troops who had infiltrated American lines on the confused Hardt Mountain front overran Wingen, site of an American battalion headquarters The Germans, who had only a few medical men and almost no equipment, separated the American aidmen

from combat troops as soon as Wingen was in their The Americans rescued some of their equipment from their battalion aid post and both sides set up shop in a schoolhouse with a German doctor in command." The American medical unit included one doctor, Lt Joseph W Reynolds, of As patients were brought in, they were treated "according to how badly they were wounded rather than by nationality The Germans used rather than by nationality Red Cross flags from American jeeps, and combined German-American litter bearer teams went out together in search of wounded"

This strange group practice was continued until the town was retaken by the Americans nishes another illustration of the brotherhood of medical men -North Carolina M J, March, 1945

#### CARDIAC REFLEXES ORIGINATING IN THE RESPIRATORY TRACT

DAVID SCHERF, M D , F A C P , New York City

(From the Department of Medicine, New York Medical College)

NESTHETICS alter cardiac activity in different ways. Many damage the myocardium by causing dilatation and impaired Some, like chloroform and cyclocontractility propane, provoko arrhythmias which may assume grave proportions, particularly when epinophrino is administered in addition thetics also influence cardino action by changing the blood pressure and vagus tonus Thus, ether narcosis may induce a complete paralysis of the vagus in cats 1 During inhalation anesthesia mechanical or chemical irritation of the respiratory tract by reflex action may produce cardiac inhibition and oven standstill Although studied widely in the experimental animal and in man these reflexes are rarely reviewed and they are usually ignored in textbooks

Roffexes may originate in the unsopharynx and larynx, in the trachea, in the larger bronchi, and finally in the intrapulmentary brenchi, and

intrapulmonary blood vessels

As early as 1880 it was discovered in the rabbit that irritation of the nasal mucosa by chloroform vapors may cause slowing and temporary standstill of the heart.2 Mechanical irritation had the same effect. The afferent pathway of this reflex seems to be formed by the sensory hranches of the trigeminal nerve but there is some evidence that the olfactory nerves also play a part.34 In man, mechanical irritation of a circumscribed area of the nasal septum, opposite the posterior end of the middle turbinate, has a similar effect on the heart Electrolysis of this area abolishes the reflex. Cardiac standstill and heart block appeared after the instillation of cold water into the nostrals of rabbits this reflex disappears after cocamisation of the nasal mucoea or during deep general anesthesia.

All these results were repeatedly confirmed in different experimental animals, moreover, it was abown that, in addition to an increase of vagal tonus, a decrease of sympathetic tonus is responsible for the slowing of the heart and the appearance of certain arrhythmuss. Stimulation of the nasal mucosa in a decerebrate dog decreases the coronary blood flow even if the

vagi are severed \*

Under certain experimental conditions pressure on the larynx causes cardiac mhibition and standstill. The centripetal stimuli are con-

ducted over the superior laryngeal nerve Charcot was among the first to point out that death may occur through these reflexes If foreign bodies stimulate the laryngeal nerves Sudden drown lag of expert swimmers is sometimes caused by these reflexes

Of interest in this connection is the case of a 64-year-old man who suffered from attacks of the Stokes-Adams syndrome on swallowing. It was demonstrated that his attacks were caused by ventricular standstill following irritation of a certain area in the laryux. Cocainization of this area hrought immediate relief. If Remarkablo effects on cardine action with bridycardin, aunculoventricular block, and extrasystolic arrhythmas are observed in man, when an intracheal tube is inserted in anosthesia with cyclopropano. The mechanical irritation of the trachea during the passage of the tube or on inflation of the attached cult produced disturbances in 10 out of 35 patients.

Slowing and temporary standstill of the heart can be obtained by mechanical standation of the smaller bronch during pulmonary surgery Slowiar phenomena have been observed in experiments and receptors similar to those in the carotid sinus have been found in the mucosa <sup>13</sup>

While irritation of the nasal mucosa arrests the beart immediately, mechanical stimulation of the laryngeal mucous membrano is only a little less effective Electrical, mechanical, or chemical stimulation of the alveolar nerves has the same effect as stimulation of the laryngeal nerves.

Cardiac arrbythmias are often influenced by the respiration. Extrasystoles can appear or disappear in a certain phase of respiration, and not rarely paroxymmal tacby cardia is abolished

by deep inspiration

Fig 1 was obtained from a patient with a supraventricular tacbycardia. Deep inspiration with bolding the hreath brought the tacbycardia to an end temporarily. In many patients this procedure or maximal expiratory effort with a closed glottis (Valsalva experiment) stops the tachycardia completely. On the other hand, cases have been published in which deep breathing regularly elicits a short attack of paroxysmal auricular flutter or fibrillation. 11-17 The experience that the same reflex may cause or abolish nirhythmias is not contradictory, even simple electrolytes and all substances acting on the heart, including digitalis and quindine, may cause

Prepared for the Section on Anesthesiology, 1945 Annual Meeting Medical Society of the State of New York Buffalo.

Fig 1 A supraventricular tachycardia is arrested temporarily by deep inspiration

or abolish extrasystoles, depending on the dosage and the metabolic status of the myocardial fibers

Reflex effects on the heart can also originate from the intrapulmonary blood vessels. Irritation of the intrapulmonary arteries may cause a fall in the systemic blood pressure, 18\_20 a phenomenon which may explain the appearance of a shock-like syndrome in patients with a small peripheral pulmonary embolism

Reflexes seem also responsible for the changes often seen in the electrocardiograms of patients with pulmonary embolism These changes, described in 1935 21 22 were explained by the rise of blood pressure in the lesser circuit in patients with massive pulmonary embolism 21 Marked changes in the electrocardiogram were observed, however, even after small peripheral pulmonary embolism and in patients in whom clinical observation and postmortem examination provided no evidence of increased pressure in the lesser circuit Since many of these patients suffer from anginal pain, since the electrocardiographic changes are quite different from those observed in right ventricular strain and may last too long to be attributed to this mechanism, it was suggested that a reflex contraction of the coronary arteries, a pulmocoronary reflex, might explain the clinical and the electrocardiographic findings 22 This reflex action would also explain the sudden death which occasionally occurs in patients with an embolism into a small pulmonary artery Furthermore, the appearance of necrosis in the subendocardial layers of the ventricles, particularly of the right ventricle, in those patients who had anatomically normal coronary arteries,25 supports the assumption that a relative myocardial ischemia causes the anginal pain and the electrocardiographic alterations

All these refleves are not active in every person. They are very pronounced in a few and are absent in most others. A certain sensitivity of the receptors, certain favorable conditions in the whole reflex arc, and a certain status of the effector organ, the heart, are necessary for their appearance.

The importance of the last-mentioned factor may be best illustrated by reference to the carotid sinus reflexes and their effect on the heart because they are generally known

In some patients pressure on the carotid sinus causes prolonged cardiac standstill fect is often ascribed to an increased sensitivity of the receptors in the carotid sinus which may play a role in certain conditions, other factors. however, also deserve consideration It has been known for many years that a damaged heart responds more strongly to vagal stimuli than the normal heart Since vagal stimulation causes a release of choline compounds it must be expected that these substances will have a stronger effect on a myocardium which is already damaged Even this factor, however, cannot explain the prolonged ventricular standstill during carotid pressure in some cases because there are no vagal fibers and no direct vagal influences on the ventricle of the mam-Vagal stimulation inhibits the malian heart auricles in the normal mammalian heart and the automatic centers of the ventricles immediately develop their own stimulus formation and prevent cardiac standstill. If the myocardium is damaged, however, the automaticity of the deeper centers is diminished and they are less alert If the auricular centers are inlubited the deeper centers do not resume their activity with sufficient speed and a long preautomatic standstill appears

Accordingly, in some patients with a very pronounced carotid-sinus syndrome the vagal inhibition of the heart need not be prominent, but if the deeper centers are damaged they do not avert cardiac standstill as readily as in a normal heart

Study of the cases described by Weiss and his coworkers in their papers on the carotid sinus syndrome24 and of other reported cases which showed a prolonged standstill of the ventricles by reflex vagal action reveals that these patients had damaged hearts, often they were at an age at which coronary sclerosis can be suspected The normal mammalian heart is excellently protected against vagal inhibition when the condition of the ventricular centers is optimal point is usually neglected in the discussions of Actually, the electhe carotid-sinus reflexes trocardiogram obtained during carotid-sinus pressure in a healthy individual may reveal the same inhibitory effect on the auricles as in a patient with the so-called carotid-sinus syndrome, in the healthy individual, however, the deeper centers escape immediately and therefore auscultation alone reveals no change anesthesia the heart is always somewhat damaged and therefore the danger of a prolonged reflex standstill of the ventricles is greater

One of the best known and most common disturbances of the heart action connected with and caused by the respiration is the periodic change of cardiac rhythm known as respiratory arrivythmia. Various explanations have been offered for this arrivythmia which is so common, particularly in healthy young people. According to some, the respiratory arrivthmia is due to reflexes caused by the distention of the lung, while others assume a purely central mechanism. It is believed that stimuli radiate directly from the respiratory center to the vagal centers, thus causing a rhythmic increase and decrease of vagal inhibition. Investigations by Annep and his associates roved that the mechanism is very complex and that both factors may play a role.

The direct influence of the respiratory centers on the vagal centers is illustrated by the following unusual observation

Case 1—A 59-year-old patient was hospitalized for angina on effort due to coronary sclerosis Examination revealed that whenever the patient held his hreath prolonged cardiac standstill occurred.

It made no difference on the degree of the cardiac inhibition whether the patient held his hreath in the inspiratory or expiratory phase. Attropice abolished the phenomenon.

Fig 2A B and C represents one tracing which was cut into three parts for publication purposes Holding the breath caused an immediate cardino standstill lasting more than 45 seconds until the first idioventricular automatic best appeared Extrasystoles are visible at the end of the inhibition. During an observation period lasting more than one month, it was always found that the cardiac standstill occurred immediately when respiration stopped and without any latent period The duration of the cardine arrest was greater with longer arrest of the respiration Carotid pressure did not induce cardiac standstill, nor did the latter ever appear spontaneously The fact that this phenomenon was present during the whole period of observation during normal breathing in any phase of the respiration speaks in favor of the presence of an irradiation of stimuli from the respiratory centers to the vagal centers. Such stimuli may be represented by the rhythmic potential changes which have been observed in the isolated brain stem of the goldfish." Presumably they are caused by the activity of the respiratory centers.

Reflexes originating in the respiratory tract do not influence cardina activity alone. They modify respiration itself and that tonus of intestinal organs. Cases of pulmonary embolism and of pneumonia which minuse the clinical picture of appendicities or cholecystitis or even paralytic deus are known. To the other hand, cardiac activity may be influenced from the skin or from various parts of the gastrointestinal tract by reflex action.

These reflexes may use different pathways Vagal fibers may be employed on the afferent and the efferent path Sometimes axon re-

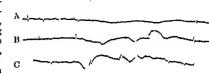

Fig. 2, Λ, B and C. The illustrations of Fig. actually represent a single tracing which was cut into three parts. Arrest of the respiration leads to immediate cardiac standstill interrupted by a fer automatic ventricular contractions. Cardiac arrespersats for the duration of respiratory standstill.

flexes may play n role. Reflexes may use the vagus for the afferent path while various pathways are used for the efferent path, in this way a tonus change in wide areas of the autonomic nervous system takes place at a great distance from the place of irritation (uradiation of autonomic reflexes)<sup>17</sup>

The available time has permitted only the discussion of a few of the known alterations of cardiac netwity by reflexes from the respiratory tract. It is certain that these phenomena occur more often than one would expect from the number of published observations. The appearnace of cardiac arrhythmias or bradycardia is, however, often overlooked if no particular search is made for it, and loss of consciousness due to cardiac standstill is usually attributed to simple syncope

The notivity of viscerovisceral reflexes in particular is easily studied on the heart because alteration of the activity of one cell or small group of cells in this organ causes changes of rate and rhythm which are readily observed and registered

Many somewhat mysterious accidents, such as "fainting spells" during nasal, pharyngeal, or haryngeal examinations, and similar episodes occurring during bronchoscopy, thoracic surgery, or on the occasion of aspiration of foreign bodies, are sometimes caused by the activity of these reflexes.

#### Summary

Some of the more important experimental and clinical data demonstrating changes of cardiac nctivity by reflex action from the respiratory tract are discussed, in the hope that this reference may stimulate the report of additional effects.

Evidence is submitted to show how important the status of the idioventricular centers is for the degree of vigal inhibition of the heart

An observation is described in which arrest of

(1926)

breathing in any phase of the respiration was always accompanied by immediate temporary cardiac standstill

#### CAUSE OF DEATH IN DIABETES

"A search through the literature for an answer to the question of the causes of death in diabetic patients reveals a large amount of available material, with surprisingly little of it based on pathologic confirmation through autopsy examination Analyses based on chincal findings alone and on diagnoses found on death certificates are filled with patent The example of a cerebral inaccuracies hemorrhage found at autopsy as a cause of death in a case clinically diagnosed as a diabetic coma is a not infrequent occurrence. This report therefore represents an attempt to determine the causes of death in a series of diabetic patients from a strictly anatomic approach It is believed that such statistical analyses based on anatomic findings givo more accurate information regarding causes of death than do analyses based solely on clinical ob-

Thus do Robbins and Tucker<sup>1</sup> open their discussion of this very timely subject. Their report is based upon an analysis of the cause of death in 307 diabetic patients upon whom autopsy was performed at the Mallory Institute of Pathology between 1932 and 1942 "For purposes of comparison, the autopsies on approximately 2,800 consecutive nondiabetic patients were reviewed." The diabetics who came to autopsy ranged from 13 to

84 years of age
The authors tell us that "perhaps worthy of emphasis is the finding of a relatively similar incidence of cerebrovascular accidents as a cause of death in

the diabetic and nondiabetic groups—52 per cent and 75 per cent, respectively "

In regard to the current debate as to the relativo frequency of carcinoma among diabetics we read that "there was a lower incidence of death from carcinoma in the diabetic group (8 4 per cent) than in the control group (14.7 per cent) It is particularly noteworthy in view of the present interest in the

relation of cholesterol and of hypercholesterolemic

states to the production of neoplasia"

The Boston observers found that coronary occlusion was two and one-half times as frequent in the diabetic group as in the control group And "pcripheral vascular disease, although a rarity among nondiabetic patients, accounted for 45 per cent of the deaths among diabetic patients, which confirms a well-known fact previously emphasized Finally, renal infection, which for many years has been considered a minor complication, is seen to be a relatively important cause of death in the diabetic Acute pyelonephritis was four and a half times as frequent a cause of death in the diabetic group as in the control group, and moreover ranks sixth among the causes of death in the former group "

In conclusion the authors tell us that "from the study, several clinical impressions were confirmed. The diabetic patient lives as long as the nondiabetic. There are, however, certain hazards that he is seemingly more likely to encounter, namely, coronary occlusion, peripheral vascular disease, infections of the extremities, and acute pyclonephritis"

Robbins and Tucker have covered their subject well and it is through studies such as theirs that our knowledge of diabetes is extended and clarified and, consequently, our efforts to combat it are becoming more effective Their figures showing that cerebral hemorrhage is but slightly more common in the diabetic will probably come as a surprise to many, as most certainly will their demonstration that acute pyclonephratis is four and a half times more preva-And it will be interesting to lent among diabetics learn what subsequent studies reveal as to the incidence of carcinoma among the diabetic -J M A Alabama, April, 1945

#### PSYCHIATRY IN WARTIME—SOME RECENT DEVELOPMENTS

JOSEPH WORTIS, M D, Senior Assistant Surgeon (R), USPHS

(From U.S. Marine Hospital, Ellis Island New York)

A CCORDING to n recent report1 of tlin A Committee on Psychiatric Needs in Rehabilitation, 135,500 men have been rejected by induction boards or discharged from the Army on neuropsychiatric grounds in the New York City area alone, long before entering combat About n million and n half men in this area are in the armed forces. This means that oven in this relatively young and vigorous segment of our population, one man is rejected on neuropsychiatric grounds for every eleven mon kept in the services The proportion of neuropsychiatric problems among our casualties nhroad is also said to be lugh. In the Canadian overseas army (n volunteer army) the extremely large number of neuroses which developed is described as "unexpected and disturbing "12 Thus picture is relieved by the fact that most psychiatric disorders - even the psychoses-encountered in military life nppear to be acute and benign 24. In splto of the large number of psychiatric rejections, it cannot be said that the screening process instituted early in the war has effectively provented a high merdence of neuropsychiatric illness. For all these reasons there has been some criticism from both lay and nonpsychiatric medical circles of the excessive diagnostle neumen and prognostic can tion of psychiatrists. In England under the stress of an acute manpower shortage, it has usually been possible to successfully substitute vocational placement in military service for sum mary discharge

#### Traumatic War Neurosis

Lattle that is new has been published in 1944 in the theory or treatment of traumatic war neuroses, but it is valuable and interesting to see how experiences are accumulating, what theories are prevailing, and what practical arrangements and policies are emerging for the most effective management of this problem

There are meas of agreement among all schools, but important differences of emphasis can be noted. These differing attitudes can be classified as follows.

- 1 The common-sense view that war neurotics are frightened or exhausted, and should be treated with reassurance and rest. Primary emphasis is placed on the immediate war experience. Relinform duty is the antidete.
- 2 The psychoanalytic view that there are intricate intrapsychic forces at play and that

enthersis of a repressed affect (anxioty or hostility) is essential to recovery. Considerable implains is placed on the basic personality structure

- 3 Emphasis on the physiologic features of traumatic war neurosis—sleeplessness, restlessness, startle reaction loss of appetite and weight with corresponding emphasis on physiologic treatment, prolonged narcosis, insulin, ergotamine tartrate.
- 4 Emphasis on the general conditions or setting in which neuroses occur, neuroses are regarded as a reflection of broken morale <sup>11</sup>

Grinker's writings and addresses have served to stimulate considerable discussion and controversy, and deserve to be closely and critically examined. The formulations and practices he describes have not won any acceptance in Eng land and are scarcely even mentioned in the Russian literature (2 English treatment is oriented around sedution,15 counselling, and practical placement in a suitable 10b Systematic routine use of prolonged sleep treatment and subshock insulin treatment is a prominent feature in the British regimen for traumatic war neurosis Limphasis is placed on the loss of weight in certain states of irritable exhaustion encountered in soldiers niter combat, a roborant course of treatment reminiscent of the old rest cure of the Weir Mitchell days is used in Britain Grinker found that after prolonged narcoss his "patients awak-oned queter and less anxious" (p 225, War Neuroses in North Africa), but he was not otherwise impressed with this treatment been netively advocating a combination of parcosis and psychotherapy in which the patient is encouraged to talk about his fears and fearful ex-The British employ the sleep, but periences avoid the talk, and uppear to be well satisfied with the results. In the Soviet Union similarly good results are reported with the use of brief ether narcosis in the treatment of hysteric mutiam 14 Frankly physiologic methods of treatment have their own claim to nttention which by no means need imply any neglect of the psychologic, situational, and morale factors in volved in war neuroses According to Penfield14 war neuroses are rare in the Soviet Union, only 0 2 per cent of the forward hospital beds are used for psychiatric cases, and only 0 1 per cent of the beds in the rear—the same number as for gynecologic cases Penfield attributes this low incidence to the high morale Grinker has taken

sharp exception to this emphasis on morale, though he himself has written, "Identification with his group is the most powerfully protective device for the soldier and overcomes the individual's feeling of being isolated, alone, and doomed in the midst of powerful agents of destruction. Such identification plus the drive toward a fixed, well-known, easily understood, and completely accepted goal is a defensive against neuroses." The exchange of letters between Grinker and Penfield makes instructive reading

Among the larger works published last year the Manual of Military Neuropsychiatry 16 is especially worthy of note Dollard and Horton 17 have done an excellent job in presenting a sound, simple, and very readable account of the psychologic reactions of men in battle

#### War Neurosis and Morale

The usefulness of certain physiologic measures in the treatment of war neuroses has kept the psychiatrist from becoming too exclusively concerned with the psychologic attitudes of his individual patient But if the mental function of the individual patient is dependent on good physiologic function, it is also dependent on influences arising out of the patient's working and social re-Penfield<sup>11</sup> has correctly stated lationships too that the creation of the kind of high morale that counteracts neuroses is not primarily a psychi-It arises from a great number of atric problem different sources, not the least of which is a strong incentive for the endurance of hardship and suffering that war entails. The close integration of psychiatric work with the tasks of orientation, education, and recreation18 is emerging as an important new development in this war Group discussions, 19 group therapy, and an understanding of the need of common work for common ends may all prove to be valuable psychiatric tools in peacetime as well as war

#### Rehabilitation Problems

Correct vocational placement of individuals with neurotic problems has proved to be useful and practicable in England under a planned war economy 5 It is expected that postwar conditions will make it possible to continue to place neurotic individuals in jobs that will help them and help society as well 20 Large industries21 in this country are already showing an exemplary insight into the possibility of using the skills and talents of some neuropsychiatric casualties According to a statement of policy of a big division of the General Motors Corporation, "We owe them a job which fits them as they now are, not just as they once were" Needless to say, these sensible and sincere principles cannot be maintained in the face of widespread unemployment Full production in the postwar period is a basic necessity if we are to rehabilitate and save our neuropsychiatric casualties

#### Physiologic Treatment of Psychoses

In the field of physiologic treatment the most important developments in the past year involve the use of physiologic methods of treatment in certain nervous disorders of wartime, <sup>8</sup> <sup>13</sup>, <sup>22</sup> the experimentation with electronarcosis in man, <sup>23</sup> <sup>24</sup> the more extensive use of ambulatory insulin treatment, <sup>25</sup> and the more precise elaboration of indications and procedure for the estrogen treatment of involutional melancholia <sup>26</sup> Shock treatment appears to be a valuable adjunct to the malarial therapy and chemotherapy of paresis, <sup>27</sup>, <sup>28</sup> and evidence has accumulated to indicate that prefrontal leukotomy is of value in some intractable cases of schizophrenia <sup>29</sup>

In addition, data continue to accumulate on some long-term therapeutic follow-up studies, so on various special aspects of the pathophysiology of psychoses, and a few new technical tips on the management of shock therapies have appeared

Electronarcosis and Insulin Therapy—Van Harreveld, Wiersma, and their associates have successfully taken up the work of Leduc, who induced electrical narcosis in man over forty years ago, and have presented a well-documented account of the induction of electronarcosis in fifty schizophrenic subjects for periods up to half an hour. The prompt reversibility and apparent safety of this type of narcosis suggest interesting possibilities. The authors claim an efficacy equal to insulin

A valuable report of follow-up studies of over a thousand patients treated with insulin at the Brooklyn State Hospital has been published by the Temporary Commission on State Hospital Problems of New York—The report concludes with the statement that insulin-shock therapy produces substantially better results in the treatment of dementia praecox than when insulin is not administered (with the highest immediate and long-range percentage of improvements in cases of short duration) and recommends the general introduction of this treatment in all state hospitals

Bond and Rivers continue their valuable follow-up of insulin-treated schizophrenia. Only a portion of their much improved or recovered patients could be followed for five years, and of these only 41 per cent maintained their improvement. Since only about half of their patients originally responded to treatment, and less than half maintained their improvement, the final result does not appear much better than the recovery rate of their control series, which they estimate at 16 per cent after five years. In terms

of useful years of health, however, these insulintreated patients did seven times as well as the controls, and the quality of the remissions was regarded as superior. Several different considerations (especially the chronicity of the cases) must be kept in mind in interpreting these figures. When the possibility of repeated treatment is taken into account these results cannot be regarded as discouraging.

The nursing shortage and the apparent success of convulsive treatment have both served to discourage the use of insulin treatment in wartime At the same time ambulators treatment with subshock doses continues in use. In spito of the fact that these are physiologic treatments they have a certain applicability to neurotic problems that involve prominent depressive features and serve to relieve these specifically depressive Both Kalmowsky and Myerson 32 23 symptoms have some sensible suggestions on the scope of these treatments in the psychoneuroses other hand, even some successful therapists contime to inlimize the physiologic aspects of these treatments and omphasize the psychologic factors, Insisting, like the character in Pickwick, that it was not the beer but the salmon that made him feel so good

#### Endocrine Treatment

Danziger is continuing his study of estrogen therapy in involutional melancholia He believes that diethylstilbestrol in doses of 1 to 5 mg a day by mouth is practically specific for involutional melancholia, provided that the diagnostic criteria are satisfied by a reasonably close association of the psychosis with irregularity or cessation of the menses and by the presence of hot flashes or other typical menopausal symptoms His suggestion that the term "estrogen deficiency psychosis" be substituted for involutional melancholia is premature, however, for it is by no means certain that the psychosis is due primarily to estrogen deficiency Other endocrine changes take place with the menopause too-pituitary preponderance, for example, which is also affected by estrogenic substances Bennett and Wilburss report successful results with convulsive treatment after estrogen treatment has failed

Pollak<sup>18</sup> found a high incidence of endocrine pathology in a large series of paranoid patients, mainly hyperplastic changes of the pituitary, parathyrold, adrenals, and thyrold, with a high incidence of timors

#### Experimental Work

A number of studies on the pathophysiology of psychoses have appeared in the past year Chesler and Himwich<sup>14</sup> have confirmed the find ing of Kerr, Hampel, and Ghantus that brain glycogen is reduced by Insulin hypoglycemia According to these authors, the caudate nucleus is first to lose its glycogen, the cerebral gray matter soon after, end the medulla and cord last and least of nll Bdhg and Hesser found n marked Increase in blood histamine during insulin shock. Proctor, Dewan, and McNeel found a general tendency toward improved glucose tolerance in cases of scluzophrenia that responded to insulin They have confirmed the tendency toward impaired glucose tolerance in schizophrenin already noted by several others use of biousy technics29 for historiathologic studies of the brain of schizophrenics is again reviving the old controversy on the organic basis of schizophrenia, this time on a higher and more productive scientific level

From the field of experimental theraps, the abolition of bulbocapaine catalepsy in the cat with AC-tetrahydro-B-naphthylamino\* is worthy of note

Pfeffer and Pescor<sup>41</sup> have again tried the experiment (done several trues before) of wholesale blood transfusion on a series of schizophrenic patients. One patient that developed a febrile reaction recovered from his psychosis Cohen, Thalo, and Tissenbaum<sup>41</sup> had no success with the acctyleholine convulsant treatment, but it is important to note that one patient who was almost moribund after collapse made a dramatic recovery

In surveying these various reports and experi onces one cannot escape the impression that no unifying principle of therapy for schizophrenia has yet emerged, and that much unnecessary confusion is due to the fact that different types of cases-acute and chronic, excited and apathetic, deteriorated andl ucid—are all included in the category of schizophrenia, though different and distinct disease processes might well be in volved Mention should be made of a valuable discussion 43 (with case reports and bibliography) of sulfadiazine psychoses, which are by no means rare complications of sulfa medication pictures generally consisted of acute delirium. or of less florid schizophrenia like pictures, with persecutory delusions Recovery was generally prompt upon withdrawal of the drug but symptoms occasionally persisted for six weeks or more

Medical as well as general social considerations continue to narrow the separating gap between psychiatry and medicano, more and more general loopitals<sup>44</sup> are opening up ambulatory and word services for the newer active physiologic treatment of the psychoses

#### A NATIONAL PROBLEM

If the reports on psychiatric casualties from the various theatres of war are correct then the business of psychiatry is iii for a big boom in the near future The comparatively minor stresses and strains of civilian wartime existence are also exacting their toll from noncombatants so that bigger, better, and more numerous institutions for their care are in the offing

It seems that the number of mental patients is increasing every year, war or no war, and the federal, state, county, and city budgets are allocating more and more funds for the housing and care of these individuals At the present rate of admissions it won't be many years before there are more people in institutions and asylums than there are out—and

that isn't good There is no source available giving statistics of the mental effects of war upon civilians, but it is generally conceded that the number of psychoses The effect on greatly increase during this period the serviceman is already evidenced by the widespread demand for neuropsychiatric assistance for

our discharged veterans The greatest difficulty at present is the shortage of psychiatrists and this situation cannot be remedied for a number of years About one half of the total number of psychiatrists are employed by hospitals and institutions where they are quite unavailable to the average patient At present there is approximately one psychiatrist for every 60,000 of the population and this is one of the reasons why over 60 per cent of first admissions to mental hospitals have never been seen by a psychiatrist

All physicians in practice, regardless of their particular specialty, come in daily contact with borderline psychopathic patients. The general practitioner and the various specialty groups should become better acquainted with the early diagnostic patterns of mental disease so that incipient patients will not learn the hard way. Any program of "refresher" courses for presentation during or after the war should include a generous amount of neuropsychiatry
The general public is still under the impression

that psychiatrists are consulted mostly by aberrant characters, but it is now time that an attempt be made to re-educate the public so that when a person states he is going to a psychiatrist he is not pre-

sumed to be a fugitive from a nut house

Some diseases such as poliomyelitis, tuberculosis and caneer have great national campaigns dedicated to raising money for their study and certainly the mental health of the nation is equally as important as any of these, so we believe a national program in the realm of prophylaxis of mental disease should be Any program toward this end should instituted (1) improve training in psychiatry for interns and residents, (2) include a department of psychiatry in every large hospital with beds available for cases needing hospitalization, (3) stimulate the general practitioner's interest in psychiatry, (4) promote greater coordination between courts of law and psychatry regarding problems of alcohol and juvenile delinquency, and (5) promote study of mental hygiene in schools, colleges, and industry — J J L, in Detroit Medical News, March 26, 1946

#### THE CAUSE OF UVEITIS

DANIEL B LIRBY, M D , F A C S , New York City

(From the Departments of Ophthalmology, College of Medicine, New 1 ork University and Bellevie Hospital)

VEITIS may be defined as inflammation of the uven or uveal tract, which comprises the plamented vascular layers of the eye, the iris, elliary body, and choroid There may he predominantly an involvement of a single portion of the uveal tract, so that the condition may be known as lutis, cyclitis, or choroiditis Two of the structures, the iris and the ciliary body, or the ciliary body and the chorold or all three parts of the uvea, may be involved. The physician consulted by the ophthalmologist, or the family physician to whom the patient has been referred or the ophthalmologist lumself must accept the duty of thoroughly investigating the cause of the lesion so that the condition may be treated as rationally as possible, and hy elimination of the cause, if possible, recurrences of the condition may be prevented

#### Investigation of the Cause

It is true that many investigations into the cause of individual cases of uveitis end fruitlessly Nevertheless, only by thoroughness and in genuity will the percentage of conditions which were formerly called Idlopathic be reduced. Di agnostic sheets detailing all of the possible avenues of diagnostic search seem worthwhile We must, however, come to the conclusion in certain cases that we simply do not have enough acuity or proper knowledge and that there is need for illuminating research in this field No attempt will be made to quote from the literature, as the source of certain information is usually evident It is hardly necessary to call the attention of the consultants to the nature of the condition and the possible causes, nevertheless, it may be worthwhile for an opthalmologist to state the conclusions gathered from his own train ing and experience

#### Methods of Investigation

Certain patients with a serious eye disease such as uveltis may demand a survey by a whole corps of specialists, each of whom will go over a particular field and then have a coordinating diagnostican sum up the data. Such a method is quite expensive if done by private physicians and not always satisfactory if carried out in a diagnostic clime. The responsibility may well be placed on a single medical consultant or family physician who is interested enough to go into the history and physical examination thoroughly, cover all

the needed points personally, order and interpret the indicated laboratory work, call in special examiners when indicated, and then have a con sultation with the ophthalmologist time, however, allould not be lost in applying treatment as indicated pending the completion of the thorough investigation. It may be possible to go too far in examinations which prove negative, but more frequently too little is done before it is decided that the results are negative and that a general systemic cause cannot be demonstrated In some cases more than one potent source may be uncovered. Then it may be assumed that one of them was the source of the inflammation or that both noted together and that it was only when the toxing from focal infection reached a certain level that the patient's reserve resistance was exhausted and that he succumbed to the cumulative effects of the multiple infections

#### The Sources of Uveius

The most promising fields of investigation in the general system are (1) a source for direct infection reaching the uveal tissues via the blood stream, (2) focal or general infection, (3) allergy, (4) trauma, (5) vascular changes which produce ischemic necrosis and asoptic inflammatory changes, (6) metabolic and nutritional disorders, and (7) neoplasm

1 Direct Infection of the Uven—An infection, an open or punctured wound, deep or superficial, an abscess in any part of the body, a condition such as a postpartum infection of the uterus, with or without septicemia, may be the source of the bacterenia and the direct involvement of the uvea by the organisms transported by the blood. The bacteria are more apt to get into the blood stream before the infection is walled off and surrounded by a pyogenic membrane, or if the pyogenic membrane is ruptured. Blood cultures, except in extremis are usually negative, but the nature of the infection and its metastatic source are evident in cases of direct infection of the uvea.

Direct Invasion of the uvea hy parasites and their larvae is known The question of the direct effect of viruses is difficult to settle How ever, it is quite possible that different types of virus may be responsible for some of the cases of uveftis.

2 Pocal and General Infections -- Focal or general infection may be of a parasitic, bacterial.

It may be of all grades of or virus nature In many instances we cannot decide whether the foci have produced a direct infection of the uveal tissues or whether there has been developed a special sensitivity or allergy of the uvea by which it may react to the distant focus of infection It is true that the uveal tissue is peculiar and reacts in a characteristic manner In the cases in which there is purulent endophthalmitis or panophthalmitis or a massive reaction there may have been a local invasion by the organisms, but when the inflammation is plastic or exudative in nature, then the reaction may well have been set up at a distance or there may have been a transfer of an attenuated strain of organisms

The family, the past personal history, and the development of any recent focal or general infection are very important. The very nature of the condition leading to the inflammation of the eye may be learned by the physician who will take the time to listen to and to question the patient, relatives, and friends. The occurrence of what was said to be a "common cold" may be of particular significance, since the organisms may have entered the body at that time

The history and careful survey will point the way to necessary investigations. Some of the structures that should be looked over very carefully are the teeth, tonsils, membranes of the nose, pharynx, the respiratory system, the sinuses, the lymph glands and the glands of internal secretion, the skin, the digestive system from mouth to anus, the genitourinary tract, the skeletal system, muscles, bones, joints, the blood and its reactions, or to put it more briefly, the entire body

#### The Granulomata

Syphilis —Formerly, syphilis was considered the most frequent cause of uvertis and even though serologic tests were negative, the patient was nearly always treated expectantly or on a provocative plan. The role of syphilis must not be underestimated, but it is not wise to pursue the antiluetic treatment very far in a negative case when the effort could better be directed to the other means of study and treatment. A spinal tap for tests on the spinal fluid may be indicated, but usually if syphilis is responsible for the uvertis, the blood tests should be positive. This is true also of congenital cases of lues.

Tuberculosis—The tubercle bacillus is a frequent cause of uvertis either by direct invasion or by a focal lesion, but the decision as to whether the patient has active tuberculosis which may be the cause of the uvertis may well be left to the internist—It is true that an infection which may cause uvertis may not be of sufficient virulence or

may be of a different nature than that which causes frank pulmonary or pleural disease chest plates and the fluoroscopic examination may be grossly negative, but there may be ever so small a lesion in tissues or glands which is not sufficient to give the typical pyrexia, diaphoresis. The infection with tubercle in and cachexia cases of uvertis is usually of the attenuated There has probably been too great diagnostic importance placed on the intradermal or patch test with tuberculin The opinion that the uvertis is due to tuberculosis even when the other clinical evidence is negative is a difficult one to substantiate, nor can one tell by the nature of the deposits on the endothelium of the corner or the other appearances of the eye whether the uvertis is due to tuberculosis or not I personally subscribe to a conservative view and mode of treatment Nearly all patients with uveitis will benefit from the rational application of proper rest, nursing care, relaxation, avoidance of stimulation, freedom from worry, and a high-vitamin diet, all of which are good for the patient with But the diagnosis of tuberculosis tuberculosis as determined only by the tuberculin test and the use of tuberculin therapy as a specific agent is not Many brilliant cures have been always sound effected with the aid of tuberculin used wisely in conjunction with other measures, but it should not be the only means of treatment It probably should not be regarded as other than nonspecific in the treatment of uvertis because of its beneficial stimulation of the body's reaction to a foreign substance, even though there is a possibility of a specific action in desensitizing the patient to the effect of the tuberculin liberated by their focal lesions The methods of the use of tuberculin are more or less standardized The initial dosage and increases made are determined by the patient's sensitivity, so tuberculin may well be injected intradermally regularly to determine the course of the treatment Thus, a check may be repeatedly made on the sensitivity of and the development of any immunity by the patient I have used tuberculin in this manner and believe it worth while Nevertheless, in certain cases in which the reaction to tuberculin was positive even in relatively great dilutions and where for some reason or other the use of tuberculin was inadvisable, I have obtained benefit from the use of other agents, chiefly bacterial antigens used in a nonspecific manner in conjunction with local and general therapy The desirable reaction to nonspecific protein therapy is a local one at the site of injection or a mild general reaction with never a focal reaction

Other Granulomata and Diseases—The less frequent granulomata and other diseases such as brucellosis, sarcoid, lymphogranuloma inguinale,

leprosy, yaws, psitacosis, frambesia, tularemia, toxoplasmosis, and onchocereosis should be considered and excluded, particularly now that our far-flung military services will be subject to these rarer conditions which may cause uveltis. The role of insects introducing these infections should be considered.

#### The More Frequent and Usual Focal and General Infections

The Teeth -There is always a debate about the role of dental infection as the cause of unotis The dentist should rightly make the decision as to whether the condition of the gingione, of the alveolae, and of the teeth is a potent cause When reconstructive or prosthetic dentistry is of his own handiwork, a dentist may be adverse to admit that each and every devitalized tooth is suspictous and is prohably infected. He should know that it is not necessary that demonstration of n frank niveolar abscess be the enterion of dental focal infection There may be sufficient absorption from a moderate pyorrhea or from a leaky crown or inlay or recently devitalized It may well be that when the tooth is dying, sufficient toxin of a virulent infection may be absorbed and cause uvertis The x-ray can be deceptive because the mass of the bone and tooth is reduced to a thin film. The true condition as determined hy removal of crowns and inlays from suspicious teeth, testing for vitality, and search for absorption areas may give information far beyond that of the v-ray It is unwise to sacrifice good vital teeth needlessly, but in the face of uvertis and Its far-reaching influence on vision, it is best to remove any devitalized or suspicious tooth A warning however, must be made here about the possibility of making the uvertus worse by the removal of too many infected teeth at one time

The Nose and Throat and Respiratory System --The examination of the nose, amuses, tonalls, and pharynx is particularly important. It is not necessary that the patient have a frank sinus The history of repeated colds, excessive mucus discharge from the nose or dripping down through the posterior pharynx, bronchitis, pneu monia, and pleurisy are all important X-ray of the sinuses checked by careful clinical exnminations will determine whether or not the nose or sinuses should be treated or operated upon If the sinus openings into the nose are occluded it might be well to open them hy astringent or vasoconstrictor solutions and, if necessary, by surgery The tonsils should be inspected and pressed or suction applied for evidence of hidden infection Such an examination may stir up a latent infection to renewed activity but If it does not cause may increase in the severity of the

uvertis the demonstration of the infection has been worth while. A definite instory of tensillitis may warrant the removal of the tensils in case of uvertis. It is well known that the mucous membrane and lymphoid tissue in the posterior pharyix afford ready entrance for many pathogenic organisms. The pharyix deserves careful examination. The laryinx, trachea, bronclul, lungs, pleura, and mediastinal glands should be examined carefully, for it is possible that some of the undiscovered for in minute form may eludo clinical tests, cultures, guinea-pig inoculation, and x ray examination.

Taxima—The Gastrointestinal Tract—Under this heading may be considered toxic conditions from any source but usually the toxemias missing from intestinal putrefraction, either from finulty digestion and elimination or from the effect of pathogenic bacteria harbored in the many recesses of the intestinal tract, particularly in the colon. These are the more important conditions If there is any evidence of a chronic infection of the appendix or gallihadder, surgery should be considered. The elimination of infected ulcers and diverticula will require the services of a gastroenterologist.

The Gentourinary Tract—The kidneys, ureters, bladder, urethin, and prostate may be foci of infection Examination of the urine, massage of the prostate, cystoscopy with cultures and guinea-pig inoculation from each kidney, when indicated, may provide the necessary information for the disgnosis

Other Focs —Abrasons of the skin and areas of dermatitis may serve as focal points for the extrance of infection Patients who have arthritis, myositis, bursitis, and osteomyelitis may develop uveitis from these as focu or they may react to the same focus that produced the skeletal lesions

#### The Value of Microscopic Smears and Cultures and Vaccines

Diagnostic paracentesis of the anterior chamber, including withdrawal of aqueous fluld, his not proved worth while. In massive purulent in fections the identification of the organism may be made and in massive tuberculosis of the uven the tubercle bacilius may be demonstrated, but in notive plastic or exudative nietits the eye does not tolerate the trauma of the puncture well and in nearly every instance the examination and cultures are negative

Microscopic examination and cultures of other tissues and organs of the discharges and secretions, eto, for bacterin and types of cells present may give important data, but crroneous conclusions may be drawn unless it be proved in some way that the organisms found are pathogenic for

the particular person With some, their mere presence, as, for example, that of the tubercle bacillus, is significant, whereas others need to be judged by different cultural and clinical tests. It is not always easy to decide this or to determine whether the injections of vaccines made from the organisms will prove beneficial on other than a nonspecific basis.

Allergy -The role of allergy is a difficult one to assay in the cause of uvertis It is true that peculiar vascular reactions occur in allergic individuals in response to certain stimuli It is interesting that one eye will react while the other, over a period of years, does not do so been stated that certain patients become sensitized to react with uveitis to the action of their own crystalline lens protein when this is changed by the production of a cataract and particularly after the lens capsule has been opened thought also that sympathetic uveitis may be produced by allergy to the patient's own pigment in the exciting eye One observer concluded that food allergy altered a patient's reaction to the tuberculin which he produced in a focal lesion It is rational to assume that the edema and infiltration common to allergic responses elsewhere in the body may involve also the uveal tract of the eye and, in obscure cases, a survey of the patient by a competent immunologist may be advisable

4 Sympathetic Uvertis and the Role of Trauma—In a class by itself is the condition known as sympathetic uvertis, in which, after an injury involving the uver of one eye, there ensues a plastic, exudative inflammation of the injured eye, followed in a relatively small number of cases by a similar inflammation of the uninjured or fellow eye. The nature of the inflammation is not known. It is possible, though the fact is not established, that one eye with uvertis not in the class of traumatic sympathetic uvertis may act as a focus for the development of uvertis in the fellow eye.

Severe direct, contiguous, or even head trauma may be a direct cause for aseptic inflammation of the uvea because of the peculiar nature of the uveal tissues and the effect upon them of sudden movements of the ocular humors, and inflammation may develop after such trauma. Even minor, direct, nonperforating trauma may condition the uveal tissues to react with inflammation in the presence of focal infection. The significance of this opinion from a medicolegal standpoint is serious and calls for an honest interpretation of facts and sequelae before it is applied. It is evident that small perforations of the globe may introduce the organisms that are responsible for the development of purulent uveits

5 Ischemic Necrosis and Aseptic Inflammation of the Uvea—Recognition must be made of the fact that lesions which arise in the uvea from vascular clianges may simulate those of infection Considerable confusion has arisen also because the effect of the vascular lesion is usually regarded as one of the forms of uveits, which term signifies inflammation and presumes origin by infection. There are lesions which develop principally in the choroid and affect the overlying retina.

These may develop through occlusion of the nunute arterioles and capillaries and had better be known as chorioretinopathy rather than In such cases the factors prochorioretinitis ductive of thrombosis should be investigated The character of the blood, the condition of the finer blood vessels, and the nervous control of these ment thought and investigation as well as the search for the focal infection which may furnish the final stimulus to the production of the thrombus The minute lesions produced in the choroid by chemical, electric, or thermal burns for their cohesive effect in surgery for reattachment of the retina have the ophthalmoscopic appearance of choroiditis produced by focal or direct infection

6 Metabolic and Nutritional Disorders—
The role of metabolic disorders or reduced resistance to infection either from a nutritional or any other standpoint is important. Diabetes, gout, blood dyscrasias, avitaminosis, etc., may prepare the way or be responsible for the local tissue disturbances which are similar to the infectious types of uveitis. They may also enable the organisms to gain a foothold because of reduced resistance of the body or of the uveal tissues to infection.

7 Neoplasm—The presence of a neoplasm, either local or from a metastatic source, should be excluded in the investigation of certain cases of uveitis, because in its early form a neoplasm may be mistaken for an inflammatory lesion and vice versa. Necrotic degeneration of a neoplasm may cause aseptic inflammation of the uvea.

#### Summary and Conclusions

A survey of the cause of uvertis and the methods of investigation with a discussion and judgment of the data obtained has been given from the personal experience of an ophthalmologist Direct, focal, and general infection, allergy, trauma, vascular disease, metabolic and nutritional disorders, and finally neoplasm have been given particular attention

#### SPONTANEOUS MEDIASTINAL EMPHYSEMA

M H STEIN, Capt. (MC), AUS

SPONTANEOUS mediastinal emphysema very closely simulates coronary occlusion, pericarditis, pulmonary embolus, and disaceting ancurysm of the norta. Because of this obvious importance in differential diagnosis, more frequent reports of cases of spontaneous mediastinal emphysems seem justified, in order to bring the condition to the attention of the profession

In 1918, during the first World War, Berkley and Coffen, from observations made in an army camp, concluded that the simultaneous appearance of pneumothorax and subcutaneous omphysems were dependent on a single cause, air in the mediastinum Macklin and Macklin credit these men with the discovery that pulmonary interstitial emphysema causes medias-

tinal emphysema.

Up to 1943, 22 cases of epontaneous mediastinal emphysema have been reported in the literature. The first complete and thorough report was made by Hammen' in 1939 when he described a total of 7 cases. His interest in the subject was again displayed when he made it the theme of the Frank Billings Lecture which he delivered at the American Medical Association convention in June, 1944. Hamman was the first to describe the real spontanenty and importance of the condition. Mackin's work was also of foremost significance in this respect.

Mediastinal emphysema, in eddition to the spontaneous form in which no apparent cause can be found, can also occur in one of the follow-

ing conditions

1 Trauma to chest, such as rih fractures, stab wounds, and gunshot wounds

2 Conditions associated with unusual pulmonary effort, such as parturation, coughing paroxysms of pertussis or croup, or severe dyspines of bronchial asthma.

3 Complicating procedures, such as induction of artificial pneumothorax, pneumoperatoneum, tracheotomy, bronchoscopy, and radical neck dissection

4 Complicating infectious diseases, such as theoreulosis, pneumonia, diphtheria, and influenza

Most cases of spontaneous mediastanal emphysema reported in recent years were in young men, except one in an older man ol 51 years of age, reported in Hamman's series.\*

The mechanism of the development of the pathology is interesting. The belief is that rupture of the pulmonary alveolt takes place spontaneously or with the slightest effort, allowing

air to escape into the surrounding pulmonary causing pulmonary interstitual physema. This escaped air travels elong the fascial planes, along the perivascular sheaths of the pulmonic vessels toward the hilus of the lung into the medicatinum. The experimental work of Macklin and Macklin' supports this mochanisin of development. They forcibly overinflated fresh excised lungs of calves hy blowing air into the tightly cannulated traches until the nivedi runtured They noticed that the pleurn became taut end that the air escaped into the connective tissue of the lung and soon hubbles of air escaped at the stumps of the great pulmonary vessels in the lung roots, at the mediantinal site.

In the mediastinum the air infiltrates the tiseues that he between the heart and the anterior chest wall. The distension of the mediastinal tissues causes pain, often severe, with radiation simulating angina pectoris. Often there is pain on awallowing or deep breatlung, which may vary with movement, such as turning from side to side or turning of the head. If the air remains trapped in the mediastinum and continues to pour into that space, then pressure on the great vessels and heart may produce deletenous effects. Fortunately, the latter seddom occurs. Usually a small amount of air is trapped and that most often is spontaneously absorbed in a few days.

Occasionally, instead of remaining trapped, the air in the mediastinum travels along fascial planes and appears ebove the clavoles, spreading up into the tissues of the neck and down over the anterior chest wall, producing subcutaneous emphyseme in those areas. In extreme cases it may even travel down over the ebdomen to the lower extremities as subcutaneous emphysema. The air from the mediastinum may also follow another course, through the epertures in the diaphragm, along the esophagus and aorta and into the retroperitoneal tissues. The usual occurrence, however, when the air does spread from the mediastinum to produce subcutaneous emphysema, is toward the claycles and neck.

Another possible course for the mediastinal nir to follow is through the pleura into the pleural space, thus producing a meumothorax. This association of pneumothorax with mediastinal emphysema is found in one third of the cases of spontaneous mediastinal emphysema, according to Hamman.

The development of an associated pneumothorax may help to stop the escape of air from the ruptured pulmonary alveoli into the interstitual tissue of the affected lung <sup>2</sup> In his original series of 7 cases Hamman<sup>4</sup> found an associated small pneumothorax of the left upper lung in 2. The case reports in the literature reviewed by this author, in which the spontaneous mediastinal emphysema was complicated by pneumothorax, all showed a small pneumothorax of the left upper lung. Hoffman, Pobirs, and Merliss' reported one, Lintz's reported one, and Griffin's reported 3 in addition to the 2 cases in Hamman's series of 7 referred to previously

Two cases, in which there was a small pneumothorax of the left upper lung associated with spontaneous mediastinal emphysema, were seen by this author at the Station Hospital at Camp Hale, Colorado These cases are described later in this report. It seems, therefore, that when pneumothorax does follow spontaneous mediastinal emphysema a small portion of the left upper lung is usually involved.

The chinical picture has already been mentioned in the description of the pain, which is substernal and may radiate to the shoulder and down the left arm like angina pectoris. The pain is usually sudden in onset and severe, the severity depending on the distension of the mediastinal tissues, and may persist for a few days. It subsides as the air is absorbed. Pain on swallowing is not uncommon, too. Pain on breathing, associated with some dyspiea, is also felt at times. Change in position may aggravate the pain.

Although the pain is very similar to such conditions as coronary occlusion, pericarditis, pulmonary embolus, and dissecting aneurysm of the aorta, the other features of the clinical picture are more distinctive for spontaneous mediastinal emphysema. It is worth noting that one case was reported by Adcock<sup>9</sup> in which pain was not present in the chest, the author attributed that to the ease with which the mediastinal air escaped into the retroperitoneal and subcutaneous tissues

The other clinical features of spontaneous mediastinal emphysema are

over the heart. This sound is usually heard with a systole along the left border of the sternum, and is heard best with the patient holding his breath at the end of expiration. The quality of the sound has been described differently by various men. It has at different times been referred to as crunching, bubbling, crepitant, crackling, cheking, and popping. One author described it as a sound comparable to that produced by the crumpling of a handful of cellophane close to the ear <sup>3</sup> Regardless of the adjective used to describe this sound, once heard it will

always be remembered as a distinctive finding Change in position of the patient alters the intensity of this sound. This finding usually persists for a few days and disappears with the absorption of air from the mediastinum. This peculiar sound is not heard in any other condition but mediastinal emphysema.

- 2 Obliteration of cardiac dullness Usually with the presence of air in the mediastinum the normal cardiac dullness is obliterated, but in some very mild cases the dullness may only be diminished
- 3 Constitutional symptoms are absent Fever, leukocytosis, increased sedimentation rate, and evidence of shock are usually not present in spontaneous mediastinal emphysema
- 4 Associated secondary pneumothorax, usually small and involving the left upper lung, is present in about one third of the cases
  - 5 The electrocardiogram is normal
- 6 X-ray may show the presence of air in a lateral view between the heart and the anterior chest wall. This is not a constant finding and is not necessary for the diagnosis. When negative in the lateral view the antero-posterior view might show a sharp distinct line parallel to the border of the heart. When the associated pneumothorax is present, that obviously will be apparent on the x-ray. In Hamman's 7 cases, reported in 1939, only 2 showed positive x-ray findings of air between the heart and the anterior chest wall. Many of the cases reported in the literature had negative x-ray findings.
- 7 Subcutaneous emphysema of the neck or elsewhere appear, as indicated previously
- 8 There are symptoms of compression of the heart and great vessels in severe cases

The most significant diagnostic finding is the characteristic sound heard along the left border of the sternum, as described previously. It must not be confused with pericarditis. The other clinical features of spontaneous mediastinal emphysema and the absence of electrocardiographic changes, fever, and leukocytosis are helpful differential points in that respect. With a knowledge of the other clinical characteristics of spontaneous mediastinal emphysema as described, coronary occlusion, pulmonary embolus, and dissecting aneurysm of the aorta can be ruled out.

The prognosis in most cases is good, the mediastinal air usually being small in amount and being absorbed spontaneously. In those cases the treatment is just symptomatic and conservative. When air block is present, due to an excessive amount of air being trapped in the mediastinum, then deleterious effects follow. Dyspnea, cyanosis, and venous distension in increasing severity are alarming signs. In those cases

surgical intervention is imperative to aspirate the trapped air by suction through needles inserted into the mediastinal space or incisions and the insertion of catheters Tortunately, most patients get well in a few days by spontaneous absorption of the air and are out of bed in a very short time

#### Case Reports

Case 1 -A soldier, 10 years of age, was admitted to the Station Hospital at Camp Hale, Colorado, on January 6 1944 with a history of sudden spon tancous onset of sovere, sharp pain in the left side of the chest, starting at the left border of the ster num, radiating to the left axilla and left side of the back, and associated with shortness of breath. Ho was admitted about twelve hours after easet of this pain and on admission It was still present. His past history was irrelovant except for a chronic cough for the past two years which was diagnosed as bronchitis in civilian life Family history was negative

On physical examination the physical signs of a slight pneumothorax of the left upper lung and n 'to-and fre" clicking sound superimposed over the heart sounds were elicited. This sound was the most striking physical sign and was heard best during expiration, along the left border of the There was slight dyspnea, but no cyanosis and no obvious signs of shock or any marked distress Completo blood count, urinalysis, blood Kahn test, repeated blood sedimentation rates, and electrocardiograms were normal. Fover was absent throughout the examination. A ray of chest on admission showed a 20 per cent collapse of the

left upper lobe of the lung.

The pain continued for a few days in diminishing intensity but was aggravated by change of position such as when the patient turned from side to side. The clicking sound along the loft sternal border, synchronous with the heart sounds, persisted for eight days after admission, after which It dissppeared. A recheck of the x rays of the chest showed a gradual disappearance of the pneumothorax, and on January 25, 1944, the affected lung was completely re-expanded and there was no evidence of any pathology in the chest by x-ray

Although the x-ray in the lateral and anteroposterior views did not demonstrate nir in the mediantinum the climical course with the presence of the characteristic, diagnostic, clicking sound, described along the left border of the sternum with the associated small pneumotherax of the left upper lung was sufficient nyidence for the diagnosis of spontaneous mediastinal emphysema. This patient made a complete recovery, as indicated above

Case 2 -A soldier, 23 years of age, was admitted to the Station Hospital at Camp Hale, Colorado, on the morning of January 29, 1944, with a history of sudden onset of substernal pain radiating to the left chest, shoulder, arm, and left scapular region on the evening of January 28, 1944 This pain was associated with difficulty in breathing and was aggravated at the end of each inspiration. It was still present on admission, but became less intense with rest in bed. When turning from side to side the patient claimed that he felt something move in his chost, which he described as a pressure sensation In 1941 the patient had had a spontaneous pnoumothorax which cleared up without much trouble, and his past history also revealed that he had had pneumonia four times, at the ages of 3 months, 6 years, 10 years, and 13 years Famliy history was negative

Physical examination on admission revealed that the patient was slightly dysphere but there was no cyanosis there were signs indicative of a slight pneumothorax over the left upper side of the chest Cardiac duliness was obliterated On the following day, January 30, 1944, a clicking sound was audible along the left sternal border, synchronous with the heart sounds, it was heard best at the end of expira tion with the patient holding his breath, and it was loudest at the third left Intercostal space. chest pain and the clicking sound persisted until February 11, 1044, nithough the pain became milder after admission and gradually less intense The clicking sound was often intensified by changing

the patient s position

Laboratory studies, including blood counts urine. blood Kahn, sputum examinations for acid-fast organisms, sodimentation rates, and electrocardiograms were persistently normal. There was no febrile reaction at any time. An x ray of the chest on admission showed a pacumothorax of the loft upper lung with about 30 per cent collapse, which by recheck films showed complete re-expansion and completely negative lung fields by February 21. 1944 Air in the mediastinum was not demon strated by the x-ray, but in view of this diagnostic clicking sound, the diagnosis of spontaneous mediastinal empliysema seemed warranted.

By February 11, 1944, the patient was free of his chest pain and the clicking sound heard along the loft stornal border was gone. He made a complete recovery with conservative treatment and returned

to duty on March 18, 1944

This patient returned to duty and got along well without any complaints until June 23 1944, when ho ngain developed suddenly sharp pain between the sternum and the entire left side of the chest, radiating to the left arm down to the elbow, assocated with difficulty in breathing. With these complaints he was again admitted to the Station Hospital. This time on admission he also complained of some slight difficulty in swallowing and said he felt as if there was some obstruction in his erophagua.

On admission there was no appreciable dyspnea or cyanosis. A double chaking sound along the left aternal border loudest in the sitting position and synchronous with the heart sounds, was again audible. There was obliteration of cardiac duliness and also agas of a small pneumotherax of the left upper lung. During the following few days the clicking sound was synchronous only with systole and its intensity varied with change in the position of the patient.

All laboratory work, as proviously, including

electrocardiograms, was negative Again there was no febrile reaction X-rays again showed a minimal pneumothorax of the left upper lung, limited to the apical region. Air in the mediastinum was again not demonstrated by x-rays in any of the lateral or anteroposterior views July 4, 1944, his chest was completely negative, with complete re-expansion of the lung affected by the pneumothorax Six days after admission the patient was free of chest pain and the peculiar clicking sound was gone Again with conservative treatment he made a complete recovery and was discharged from the hospital on July 10, 1944

#### Discussion

In both of these cases the diagnosis of spontaneous mediastinal emphysema was made on the presence of the characteristic clicking sound, synchronous with the heart sounds and heard best along the left border of the sternum asmuch as the failure of the x-ray to demonstrate air in the mediastinum is not sufficient cause to invalidate such a diagnosis in the presence of the above diagnostic sign, the negative x-ray findings in these cases, therefore, were not too significant The occurrence of the small pneumothorax in each case was considered secondary to the spontaneous mediastinal emphysema, which is the accepted pathogenesis in these The involvement of a small portion of the left upper lung by the pneumothorax is worthy of note, since it closely resembles the pattern of most of the other cases reported in the literature

The recurrence of this disease in the second case within an interval of a few months is interest-It is possible that his pneumothorax in 1941 was also secondary to mediastinal emphysema

#### Summary

- A brief résumé of the subject of spontaneous mediastinal emphysema is presented
- The importance of recognizing the clinical picture of spontaneous mediastinal emphysema in differentiating it from such conditions as pericarditis, coronary occlusion, pulmonary embolus, and dissecting aneurysm of the aorta is stressed
- The absolute diagnostic sign is the peculiar 3 clicking sound along the left border of the sternum, as described
- The negative x-ray findings do not invalidate the diagnosis
- Two cases in young men are presented, one with a recurrence of the disease

#### COMMITTEE ON ARTIFICIAL LIMBS IS

Announcing the organization by the National Academy of Sciences and the National Research Council of a Committee on Prosthetic Devices, the Journal of the American Medical Association for April 7 points out that this move brings the promise of new advances and progressive development in the manufacture of artificial limbs The Journal

says
"At the request of the Surgeon General of the the National Academy of Sciences and the National Research Council have organized a Committee on Prosthetic Devices Here for the first time experts in the field of engineering will combine with surgeons and inventors to apply to the manufacture of artificial limbs the knowledge that has been gained in the fundamental sciences history of prosthetic devices indicates that there has been a failure to apply much of the knowledge that has become available The tendency has been for manufacturers of devices to hold strictly to models which they have themselves developed and on which they might be able to establish patents Brace makers and makers of artificial limbs fre-

#### FORMED

quently have held as trade secrets some of the inprovements which they have developed and would teach them only to their own apprentices new discoveries have been made in alloys of metals which would provide light weight, malleability, freedom from rust, and other desirable factors. These dom from rust, and other desirable factors These have, however, been incorporated too infrequently in the making of prosthetic devices. The committee will aim to incorporate these new advances into the making of artificial limbs and to bring about as much standardization as possible in parts and mechanisms so as to assure simplification of main-tenance and repair The auspices under which this committee has been established and the inclusion of such names as those of Kettering, Magnuson, McClure, and Wilson mean that progress will be made

The chairman is Dr Paul E Klopsteg, professor of applied science at Northwestern University, who gives assurance that the points of view of engineering, production, fitting, and servicing, as well as the medical and surgical points of view, will prevail

in the work of this committee"

#### THE INCREASED INCIDENCE OF VENEREAL DISEASE IN UPSTATE NEW YORK

JAMES H LADE, M.D., Albany, New York

(From the Durision of Syphilis Control New York State Department of Health)

URING these times of world-wide turmoil and catastrophe, an increase of venereal disease in upstate New York can scarcely be regarded as a major calamity. Yet such an in crease has a significance beyond its mere size, as a portent of the times and as a herald of the problem of postwar medical care. And the fact that the following data were gathered by means of a reporting system which is unique in respect to size of population, area of coverage, completeness of data for the population served, and the accuracy of information concerning cases reported may have valid implications for populations outaide of the area served

In 1942, physicians in upstate New York reported 13 per cent more cases of early syphilis than in 1941, 26 per cent more in 1943, 32 per cent more in 1944, and 60 per cent more in the first quarter of 1945 That this increase in infectious syphilis was discovered by a profession with only 53 per cent of its members practicing in 1940, and in a population from which over 30 per cent of the men 15 to 40 years of age had been removed, is of grave import.

Before proceeding to further analysis of these figures, it may be desirable to describe briefly the system under which they are gathered, since the validity of our conclusions must depend in large measure upon the integrity of the procedure

through which information is gathered

Prior to 1936, there were only two citles in New York State in which effort was made to gather information concerning all cases of syphilis known to the practicing profession, hospitals, and climes At the beginning of that year it was required by law that copies of every positive laboratory report be forwarded to a responsible health authority, which was empowered to secure from the physician a case report including the name of the patient and the stage of disease. It required three years to bring this system of reporting to its present degree of completeness In the years 1939, 1940, and 1941 the number of cases of syphilis reported and the proportion of these patients in their first year of infection seemed to approach a balance, as will be seen in the following table It is not clear that gonorrhea was reported with the same degree of completeness, for there is in this disease no indispensable laboratory procedure, such as the complementfixation test for syphilus, which would hring the

cases to the attention of the public-health authorities, nor was there any apparently valid necessity for n program to place or keep the patient with gonorrhea under observation or therapy

By way of documentation of these data, it may be said that every laboratory performing serologio testa for syphilis in the upstate area which reported these results to the practicing physician was sending copies of positive and doubtful reports to the local health authority hy Ninety-eight per cent of the persons from whom these specimens had been withdrawn were reported as cases, or were stated, in a few instances, not to be infected with syphiles Though the law was specific in requiring the physician to report all cases coming to his observation, prosecution was not employed to compel its observance among those who could not reconcile themselves to the observance of the public interest in this matter Yet only 2 per cent of the profession refused to report their cases Although the Sanitary Codo permitted the reporting of cases of syphilis by initials and date of birth, more than 97 per cent were reported by full name and address

In order to truly evaluate the agmificance of the apparent increase of syphilis for localities, age groups, and sex and race classifications, the experience of the prewar years 1939, 1940, and 1941 was combined into averages for these groups. lest the variation in any year used as a standard yield a false impression. The following tabulation by size of city demonstrates that the increased spread of syphilis has been demonstrated most clearly in the larger citles Information gleaned from Selective Service serologic examinations, in which the percentage of examined individuals positive to the serologic test for syphilis was quite as high in rural as in urban areas, indicates that this disease is quite as prevalent in the smaller places and the countryside as in the cities seems probable that an increase of early eyphilis has not been noted in those areas because of their relatively greater loss of physicians, rather than through any difference in morbidity None of the larger municipalities in New York State has escaped the rising tide of venereal infections was noted first in places in which reporting was best, but had come to light in all the larger cities by the end of 1944

The Negro has played a role of far greater importance in this outbreak than the proportion

TABLE 1 —Reported Cases of Syphilis, All Stages and Early Acquired, and Gonorrhea New York State, Exclusive of New York City, 1939-1945

	Syphilis			
Year 1939 1940 1941 1942 1943 1944 1945 (first quarter)	All Stages 14,266 12,695 12 920 12,997 12,088 9,173 1,984	Early No 1,081 1,011 1,019 1,151 1,288 1,347 417	Acquired Per Cent 7 6 8 0 7 9 8 9 10 7 14 7 21 0	Gonorrhea 5,308 5 070 5,119 4,955 4,854 5,632 1,907

of his race in our population According to the 1940 census figures, less than 3 per cent of the up-Yet 36 8 per cent state population were Negro of late cases of syphilis reported in 1944 were among this group, and 43 7 per cent of the early infectious cases The ratio of early to late syphilis was 1 4 8 among Negroes, as compared to No specific explanation 1 6 3 among whites has been found for this apparently high discovery rate of recent infections among this race, unless it be attributed to the younger average age of acquisition of the disease among these people. an explanation which seems inadequate. It is to be noted that no Negroes known to be transient were included in these tabulations. Hundreds of case reports were received for farm workers who were brought from the South to harvest the crops, and returned to their homes after the working season, but these have not been counted

The younger adults from the ages of 15 to 20 began to be reported as early cases in increased numbers for the first time in the upstate area in 1942, when the number was 27 per cent above that of the prewar years By 1944, the morease in early syphilis in the age group had reached 114 per cent in the upstate area. As would be expected in a population from which many young males had been removed, the proportion of females found to have recent infections increased from 44 per cent during the prewar years to 52 per cent in 1944 Considering the greater probability of the female's being unaware of her infection and the greater difficulty of diagnosis in this sex, it seems probable that there remains in the population a large group of undiscovered cases in women

But the most alarming feature of these observations is the low proportion of discovered cases which are in a stage in which transmission of infection may be terminated by treatment During the prewar years, less than 1 in 11 cases were reported during their first year of infection, according to the diagnosis of their physicians. It would seem that 10 of every 11 cases had transmitted their infections as widely as their habits and opportunities would permit before treatment

TABLE 2—Number of Reported Cases of Early Acquired Syphilis by Population Groups New York State, Exclusive of New York City, Average 1939-1941 and 1944

Total*	Prowar Average, 1939-1941, Number 1,037	1944, Number 1,347	Per Cent Increase, 1944 over 1939-1941, Average 29 9
Places over 10,000	650	964	48 3
Over 100,000	280	502	79 3

Places under 10,000	338	335	-0 9

<sup>\*</sup> Includes cases and population in State and Federal institutions, for 1944, it also includes cases reported from military areas

was instituted, which in the late state would affect only the welfare of the individual patient, while his undiscovered sex partners pursued their courses toward the ultimate pathology of the disease. In 1944 early cases constituted 147 per cent of reported acquired syphilis, a proportion of 1 to 68. In no locality in which accurate records had been maintained has the proportion of early cases been higher than 1.5. It seems doubtful that treatment of infectious cases, however effective, can control a disease in which approximately 80 per cent of the infected individuals continue to spread their virus until natural immunity operates to terminate the occurrence of infectious lesions.

But there are more possibilities of further control than is being effected at the present time The investigation of sexual contacts of cases of recent onset leads not infrequently to patients who have been reported to the health department as having late syphilis (more than one year in duration) It is certain that there are still other cases reported as late acquired syphilis which are actually still infectious Nothing can be done in the way of contact investigation of all late cases, for personnel are insufficient for this huge task even in normal years and especially so at this It remains for the practicing physician, whose case finding is the backbone of venereal disease control in New York State, to designate every patient who has or may have a case of early syphilis of recent onset, in order that investigation of sex contacts may be prosecuted to the end of terminating every possible chain of infection in our population

The urgency of this problem is demonstrated by a review of the course of venereal disease after the last war. It was during the postwar period that the greatest spread was noted. It is apparent that a seeding of the female population with venereal disease has occurred during this war. Unless efforts to find infectious cases are redoubled, a recrudescence of these infections is

probable

## THE PRESENT STATUS OF RESEARCH IN THE CHEMOTHERAPY OF SULFONAMIDES, SULFONES, AND RELATED COMPOUNDS IN EXPERIMENTAL TUBERCULOSIS

M I SMITH, MD

(From the Durision of Physiology National Institute of Health, Bethesda, Maryland)

That and failures in the search for a specific SHALL not attempt to recount the numerous drug in the treatment of tuberculosis beyond reminding you that gold, copper, mercury cadmium and several rare elements calcium, arsenic, silver, the acridine and other dyes and chaulmoogric neid and Its esters have each had their day, with disappointment following in their wake Some work now in progress on the chemotherapy of a series of synthetic altoyohe acids structurally related to chaulmoogric acid appears promising and interesting. The question of antibiotics in experimental tuberculosis, too, is receiving some attention. Time will not permit me to go into a dotailed discussion of this. I shall limit myself to a hrief survey of the more recent developments in the field of research on the sulfonamides and related compounds as applied to the problem of tuberculosis chemotherapy

First, let me begin with a definition of the term "chemotherapy" Chemotherapy as used here denotes the treatment of an infectious disease with a chemical possessing specific and preferential cytotoxic notion against the invading microorganisms without affecting ndversely the normal physiclogic processes of the host. It must have either a direct action by virtue of its own physical or chemical properties, or it must be capable of yielding a product of its metabolism in the body, and in sufficient concentration in the blood and the tusues, to effect a bactericidal or bacteriostatic action to enable the organism to rid Itself of the infectious agent. Stimulation of the defense mechanisms of the host may be an im portant contributing factor, but can hardly be regarded as the primary and essential effect of a specific chemotiverapeutic agent.

Permit me to remind you again that up until 1935 all attempts at chemotherapy of bacterial infections were essentially unsuccessful despite the fact that effective chemotherapeutic against certain protozoal diseases, such as malaria, amebiasis, trypanosomiasis, and syphilis, had been known for some time. With the advent of prontosil in the treatment of streptococcal infections, the active constituent of which was later shown by the Trefouels, Nitti, and Boret to be sulfanilamide, our interest in chemo-

therupy of tuberculosis has reawakened Rich and Follis<sup>2</sup> were the first to demonstrate an inhibitory effect upon the development of tuberculosis in guinea pigs treated with large doses of sulfandamide However, in order to be effective the drug had to be administered in such large doses that many animals died of drug toxicity.

This has been amply confirmed in other laboratories, and the same appears to be true of sulfapyridine and sulfathiazole Nevertheless, Rich's work has served to emphasize the possibility of modification of chemical structure of sulfanilamide to enhance its activity against the tubercle bacillus in a manner comparable to the effectiveness of sulfapyridine in pneumococcal infections

Following these early reports by Rich in 1938 and 1939, we undertook a survey of some twenty-five compounds—sulfonamides, some sulfones, and a few phespherus-related compounds, many of which had been synthesized in our laboratories by Dr. H. Bauer in the course of some studies on the chemotherapy of experimental bacterial infections. It was our aim to screen out by preliminary in vitro tests the more promising compounds for more detailed study.

Chart I depicts a few of the more interesting compounds of this series Sulfamilie acid (SN), which may be considered as the precursor of sulfanilamide, had no inhibitory action aminst the tubercle bacillus, human strain, grown on glycerin broth, in concentrations up to 500 mg per cent, while sulfanilamide (SA) inhibited growth at n concentration of 50 mg per cent Introduction of an ethanol substituent in the N' position of sulfamilamide (SE) decreased the activity as did the introduction of cinnamic acid in the same position (SC) Both these compounds are less to ue and much less accetylated than sulfanilamide. Examination of sulfapyridine (SP), sulfathlazole (ST), and sulfadiazine (SD) showed higher netivity, while the most effective compound of the whole series was 4,4'-diaminodiphenylsulfone. This, it seemed to us at that time, indicated a superiority for the sulfone (DDS) over all the other compounds Subsequent tests in tubercle-infected guinea pigs, in which the drugs were administered daily in doses up to the limits of tolerance, indicated no protective netion from sulfapyridine or sulfathiazole, a degree of protection from sulfadiazine, and the

best results were obtained from diaminodiphenylsulfone 4

A point of theoretic interest is presented in the compound phosphanilic acid (PN), which is the phosphorus analogue of sulfanilic acid <sup>5</sup> While sulfanilic acid was wholly inactive, its phosphorus analogue showed good inhibition of growth in vitro at a concentration of 10 mg per cent. Since sulfanilamide is more than 10 times as active as its precursor, sulfanilic acid, it seemed reasonable to suppose that phosphanilamide, that is to say, the phosphorus analogue of sulfanilamide, would greatly surpass the latter in activity. So far it has not been possible to synthesize such a compound. However, we have succeeded in

introducing the benzene phosphonic group in the N' position in sulfanilamide (SPN) with disappointing results, since the activity of the compound proved to be lower than that of sulfanilamide and much lower than phosphanilic acid

Pursuing the problem further, we proceeded to determine the comparative effectiveness of a series of sulfanilamide-substituted derivatives, including sulfadiazine, and some of the newer compounds closely related to sulfadiazine

Chart 2 shows that the compounds chemically related to sulfadiazine, namely, sulfapyrazine (SPZ), sulfamerazine (SMZ), and sulfamethazine (SMT), all have moderately good inhibitory

However, when tested in action in vitro tubercle-infected experimental animals under our standard conditions they showed httle activity Equally poor results were obtained in experimental animals with the acroyl derivative of sulfanilamide, irgamide (IM), and slightly better results were obtained with the dimethyl benzoyl derivative, irgafen (IF) The superiority of N4 caproyl amino benzene sulfanyl hydroxylamine (SB) as shown in the chart is only apparent, as will be pointed out later, for the toxicity of this compound offsets what possible advantage it might have 6 The same is true of the phosbisdimethylaminophenyl compound phorus phosphinous acid (DP)

Following this preliminary survey it became apparent that the sulfonamides did not offer a very promising field, but that in the sulfones there seemed to he some possibilities Bloch, and Hamon showed in 1940 that 4,4'diaminodiphenylsulfone was far more effective than sulfanilamide against avian bacillus infection in rabbits. Our own studies showed a greater inhibiting action in vitro for the sulfones than for any of the other compounds studied This compound, first used by Buttle and associates,8 is practically insoluble in water and much too toxic, and so the problem resolved itself into synthesizing derivatives and chemically related compounds in the hope of decreasing toxicity and increasing antibacterial specificity But before going into this phase of the problem let me digress for a moment to discuss briefly the methods we use in testing compounds for chemotherapeutic effectiveness

The in vitro tests to which I alluded earlier, while useful to the extent of eliminating wholly mactive compounds, and though useful from the standpoint of indicating probable direction to be followed by the chemist in his syntheses, have their limitations A compound active in vitro may not necessarily he active in the animal body. or it may be too toxic to the host, or it may not be retained sufficiently long or in sufficient concentration to evert hacteriostasis, or it may he inactivated in the animal hody too rapidly to he of any value On the other hand, a compound mactive in vitro may he so altered in its metaholism in the body as to yield a highly effective degradation product It is clear that in the final analysis chemotherapeutic effectiveness, like toxicity, can only he determined hy adequate tests in experimental animals. Unhappily, in tuberculosis this is a time-consuming and lahori-

The thought has been expressed that an effective remedy in guinea-pig tuberculosis need not necessarily he effective in the human, since human tuberculosis is not the same as guinea-pig tuher-

Witness the results of such tests with culosis This, it has been asserted, is highly promin effective in the guinea pig, hut ineffective in the human 9 To this I do not subscribe I am thoroughly convinced that guinea-pig tuberculosis is at least as reliable a tool in tuberculosis chemotherapy as trypanosomiasis in mice was in research on chemotherapy of human syphilis. or as streptococcus and pneumococcus infections in mice have been in the more recent researches in chemotherapy of these infections. I think the promin case has not heen stated correctly would be more accurate to state that promin has proved moderately effective in retarding and perhaps arresting the tuberculous process in guinea pigs4,10-12 and that it has appeared to be somewhat effective in human tuberculosis as well 13,14 It is my feeling that, given a compound which will prevent the development of the disease in guinea pigs under carefully controlled conditions when administered in well-tolerated doses over a period of thirty to forty days following a moderately heavy infection, such a drug may well he expected to have a beneficial effect in the human, and might well be tried, provided its safety has been well established by adequate pharmacologic studies This, in brief, is our method, and these are our criteria of chemotherapeutic effectiveness

We inoculate our animals, controls and treated alike, intraperitoneally with a heavy suspension of tubercle bacilli, human strain, a dose of 05 or 1 mg moist weight per guinea pig being used From this we expect a mortality of 50 per cent or over in sixty to one hundred days in the controls The extent of tuberculous involvement is rated at necropsy on the basis of 0 to 4, according to the amount and extent of gross lesions in the organs most commonly involved, namely, the omentum, the spleen, the liver, the peritoneum, kidneys, and mesenteric glands, and the lungs This gives a maximum count of 20 for any one Fifteen to 20 animals are used in the anımal controls and an equal number in each of the treated groups Treatment is given by stomach tube, suhcutaneously, or intravenously, once a day, in doses close to but not beyond the limits of tolerance, and the treatment continued usually for thirty days following infection, that is to say, during the period of active dissemination of the invading micro-organism when the disease process becomes fully established We use young growing animals, so that the weight curve may serve as a guide to hoth the disease process and the toucity of the drug At the end of a suitable experimental period, usually sixty to one hundred and twenty days, when 50 per cent or more of the controls have died with tuberculosis, the experiment is terminated, autopsy is performed

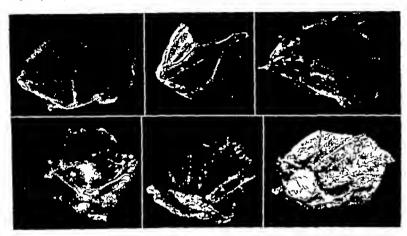

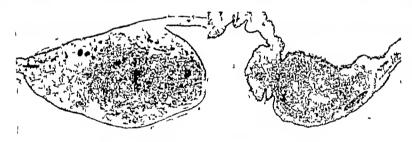

Fig. 1 Infected chorro-allantois

Figs 2 and 3 Microscopic appearance of chorn-allantoid tubercles

on the animals, and the extent of tuberculous is determined

In the final analysis the average extent of tuberculous involvement, or "tuberculous index," in each of the treated groups is calculated in comparison with the control group, the latter being given a rating of 100. It is our practice to use a standard drug of reference, in addition to the controls, in every series of tests with new drugs in order to provide a means of comparison of the efficacy of the compounds under examination. We have generally employed diaminadiphenylsulfone, and sometimes promin, as our standard of reference, since in our experience these two drugs in equimolecular doses calculated on

the basis of diaminodiphenylsulfone content give about the same degree of protection. Blood levels are determined in small groups of normal animals, run concurrently and treated in the same manner, in order to ascertain the maximum blood concentration attainable under the expermental conditions at different times during the twenty four hour period <sup>13</sup>

It is to be emphasized that this type of testing is not advocated as a means of determining whether a given drug is or is not suitable for clinical trial. Much more extensive work will be needed to determine the suitability and safety of a new chemotherapeutic agent for clinical trial. This type of testing, it is believed, is

Fig 4 Effect of avirulent tubercle bacilli on chorio-allantois

sufficiently adequate for exploratory investigations with the object of picking up leads and following them through. These tests do not determine the ultimate value of a given compound, but rather indicate its relative place in the chemotherapeutic spectrum, and that is about all that seems to be needed at the present time, for we need to go much further along developmental lines before we can consider clinical trial with this or that drug

Even with this abbreviated type of testing as just outlined it takes a good deal of work, time, and much more drug than is usually available New compounds in exploratory work are not often made in more than 5- or 10-Gm lots, while an adequate test in guinea pigs usually requires ten to twenty times as much Moreover, it is desirable to have a test from which preliminary and partial information could be obtained in a few days, with a small outlay of drug, before the more elaborate tests are undertaken With this in mind Dr E W Emmart and I have devised the tuberculostatic or tuberculocidal test employing the chorio-allantois of the developing chick embryo Goodpasture and Anderson<sup>16</sup> had shown that when a heavy suspension of avian tubercle bacilli is planted on the chorio-allantois of an eight- to ten-day-old chick embyro discrete and conglomerate tubercles developed within the extraordinarily short period of seven days We have confirmed this, for the human and bovine strains, and have shown that only viable tubercle bacilli will produce this effect, it that the extent of involvement of the membrane is related to the virulence of the strain, 18 and that attentuation of virulence of a given strain, as when exposed to the action of a suitable drug, can be demonstrated by this method 19

Fig 1, upper row, shows the gross appearance of the chorio-allantois removed six days after it had been implanted with 0 2 cc of a suspension of tubercle bacilli, human strain H37Rv, containing 1 mg of bacilli, moist weight. This is a virulent strain. The membranes in the lower row show the effects of the same dose of H37Ra.

an avirulent dissociant, planted at the same time and under the same experimental conditions Figs 2 and 3 show the microscopic appearance of infected membranes with tubercles in various stages of development, which are formed in the mesodermal layer by the monocytes prohferating in response to the invading micro-organism Nonvirulence or attenuation as brought about by bacteriostatic or bactericidal action of drugs reduces the invasiveness of the tubercle bacillus, so that it fails to penetrate the deeper structures even though acid-fast organisms may be found on the ectodermal layer, but no tubercles are formed in the mesodermal layer, as may be seen in Fig 4

We have used this technic as an aid in evaluat-First the toxicity ing chemotherapeutic efficacy of the drug for the chorno-allantois is determined Then a suspension of bacilli is made containing the maximum amount of drug which will permit the survival of about 50 per cent of the embryos The mixture is planted on the chorio-allantois of a group of embryos and after six days the incidence and severity of infection are noted equal number of controls are treated with the same bacillary suspension in normal saline A comparison of the incidence of infection and extent of tubercle involvement permits an evaluation of tuberculostatic or tuberculocidal It is an in vivo test, as it takes into account the biochemical reactions between invading micro-organism and host cells limitations of the test is that it can be used only with water-soluble compounds

Table 1 gives the results of such a test with five water-soluble derivatives of diaminodiphenyl-sulfone. Of these, promin exhibited slight activity and the N-phosphoryl derivative, to which reference will be made later, appeared to be the most active.

Chart 3 shows the structural formulas and chemical relationships of a group of sulfones and sulfone derivatives that have been studied by one or more of the methods outlined inhibitory concentration of the parent substance, diaminodiphenylsulfone, in vitro is 2 to 5 mg per cent, partial inhibition at 2, complete at 5 mg per cent Next are shown two double-substituted formaldehyde derivatives, sulfoxylate and promin The sulfoxylate derivative was first synthesized in our laboratories by Dr H Bauer in 1937, although the method of preparation was not described until 1939 " Almost simultaneously this compound was also made by Dr G W Raiziss, of the Dermatological Research Laboratories

More recently it has received much publicity under the trade name of Diasone The next three compounds are monosubstituted

water-soluble derivatives, the sulfonic, acetic, and picotinic acid derivatives. Then follows the insoluble propylamine derivative, then the 4-amino-4'-nitro and 4-amino-4'-hydroxy di phenylsulfone. The insoluble amino thissole derivative-promisole 11-18 shown next, and last two water-soluble phosphorylated derivatives prepared by Dr E L Jackson " The activity of these compounds in vitro is indicated by numerals and their therapeutic efficacy by figures in the "TB index" column This is shown in greater detail in Table 2

Ten of these compounds were tested in five different series of experiments at different times. each experiment lasting from fifty to one hundred and seven days Taking into consideration the survival rate and extent of tuberculous involvement in comparison with the controls, and the drug doeage used in relation to toxicity, it appears that the N-phosphoryl derivative and promin are better than all the other compounds examined, they are about equally effective and safer than the parent sulfone 15 It should be noted that all the compounds had a retarding influence on the tuberculous process, though none prevented or completely arrested the disease process It is conceivable that some of the compounds might have given better results had It been possible to maintain higher blood levels

A glance at Table 3, in which seven sulfonamides and two phosphorus related compounds tested are analyzed, with the sulfone or one of Its derivatives used as a standard of reference. shows that none except sulfadiazine exerted significant retardation of the tuberculous process Most of the compounds were well tolerated, and gave uniformly high blood levels

In conclusion, a lead has been established and a beginning made, it is hoped in the right direction. By judicious substitutions it has been possible to synthesize water-soluble derivatives of diaminodiphenylsulfone Some of the derivatives have shown a much reduced toxicity, but activity has usually been reduced too Rational substitutions to effect greater specificity and activity involve fundamental knowledge of the

nutritional requirements of the tubercle bacillus and the enzymatic process concerned in its metabolism Woods,23 has provided a key to a better understanding of the mechanism of antibacterial action of sulfanilamide when he showed that p-aminobenzoic acid was essential for their growth and metabolism and that sulfamilamide, because of its chemical and biologic similarity to p-aminobenzoic acid, could compete with it metabolically and thus was able to deprive the micro-organisms of the utilization of this essential growth factor

In like manner McIlwain<sup>24 25</sup> has recently contributed important information on the requirements of streptococcus hemolyticus for pantothenic acid, the utilization of which can be blocked by the simple substitution of a sulfonic group for the carboxyl group it may be possible to introduce a suitable substituent into the p-amino benzene sulfonyl nucleus to block effectively the utilization by the tubercle bacillus of a factor essential to its sur-As far as is known the nutritional requirements of the tubercle bacillus are not very complex, though the products of its metabolism are many and complex, as shown by the researches of Anderson and his associates 26 In this connection it is of interest to note that Lloyd and Middlebrook<sup>7</sup> have recently tested a sulfamilyl derivative of 1,4-naphthogumone and found it highly effective in vitro against the tubercle bacillus and its activity was not antagonized by p-aminobenzoic acid and Newman<sup>23</sup> had previously obtained a naphthoquinone from the tubercle bacillus and more recently some evidence has been adduced to indicate that certain acid-fast organisms require naphthogumone as an essential growth factor 3 The possibilities are many and there is much work ahead before a specific drug can be recommended for the treatment of human tuberculosis

## HOW TO KILL AN ASSOCIATION

Don't come to the meetings

But if you do come, come late If the weather doesn't suit you, don't come 3 at all

4 If you do attend a meeting, find fault with the officers and other members

5 Never accept an office, as it is easier to criticize than to do things

Nevertheless, get sore if you are not appointed on a committee, but if you are, do not attend com-

mittee meetings If asked by the chairman to give your opinion regarding an important matter, tell him you have nothing to say

After the meeting tell everyone how things ought

to be done

Do nothing more than is absolutely necessary, but when other members roll up their sleeves and willingly, unselfishly use their ability to help matters along, howl that the association is run by a chque

Hold back your dues as long as possible, or don't pay at all

Don't bother about getting new inembers 10

Let the secretary do it

When a banquet is given tell everybody money is being wasted on blowouts which make a big noise and accomplish nothing

12 When no banquets are given say the asso-ciation is dead and needs a can tied to it

Don't ask for a banquet ticket until all are 13 80ld

Then swear you've been cheated out of 14 **Yours** 

15 If you do get a ticket, don't pay for it

If asked to sit at the speaker's table, mod-16 estly refuse

If you are not asked, resign from the asso-17 ciation.

If you get your Bulletin don't read it, if you 18 don't get it complain to the secretary -New York Telegram

#### DERMATOLOGIC ASPECTS OF POLIOMYELITIS

JOSÉ GUADALUPE RETES, M D New York City

ERMATOLOGIC manifestations are, in many cases, associated with general pathologio processes taking place within the buman body, that is to say, they are external manifestations of what is going on internally A better understanding of the character and form of the various skin lesions will eventually lead us to the real cause of a disease which may be located in one or more internal organs. The reverse may likewise hold true Chloasma uterinum, for example, is, according to our present information. associated with various pathologic or physiologic processes taking place in the uterus. Some inventurators have also reported cases of pigmentation of the skin during the period of gestation, only to have it clear up completely after childbirth Addison's disease, due to destruction or depression of one or both suprarenal glands, is accompanied by a dirty-grayish brown pigmentation of the exposed areas of the body, and this pigmentation is sometimes confined to the avillae, anus, lips, genitalia, nipples, tongue, or the mucous membrane of the mouth. Moreover, this pigmentation is more pronounced over the bony prominences, with occasional black freekling of the neck and shoulder areas Hemochromatosis, a disease of metabolism, is characterlzed by a bronze shade of pigmentation of the skin, concomitant with hypertrophic cirrhosis of the liver and changes in the pancreas

Hyperkerannization in Poliomyelitis

During the recent opidemic of poliomyelitis in New York City I had the opportunity to observe the great frequency of hyperkeratinization in patients suffering from this disease Eighty-four children were admitted to St. Francis Hospital suffering from poliomyelitis, their ages varying from infancy to 14 years. The incidence of poliomyelitis in the infant group was small, slightly less than 6 per cent, as compared with older children The disease was more common in boys than io girls, the ratio being five to one Dermatologic observation of these children revealed that 98 per ceot had skin lesions located on both infrapatellar areas, on the anterior and lateral aspects of both ankle joints, on the dorsa of both feet, on both soles, and oo the malleoli The lemons were symmotrical and were typically those of byperkeratinization in the form of plaques, small papules, or slightly verrucous elevations, with roughness end dryness of the skin of the legs Roughness and dryness were the commoo lesions found to the infant group, however, one infant, 11 mooths old, showed oli the various types of lesions found in the oldor ohildren. They varied in size from a dime to a half dollar, and sometimes they were covered with fine scales. They showed a dirty lie and were present in the areas where there was friction. These lesions, produced by vitamin-A deficiency, are not to be mistaken for the friction dermatitis encountered in children in areas where friction is common.

In addition, some children showed lesions of the follicular kerntuniation type located on the infrapatellar areas, on the dorsa of the toes, especially the great toes, and on the anterolateral aspect of the thighs and the posterolateral aspect of the upper third of the forearm. The scincform type of eruption was completely obsent

As previously stated, lesions of these types and forms are encountered in cases of vitamin-A deficiency, and their abundance seemed to be proportional to the severity of the poliomyelitio involvement, their prominence disappearing with the abatement of the policmyclitis These were the external and visible manifestations of vitamin A deficiency, but what about the metaplastic changes taking place at the same time in the mucous membranes of the internal organs, Since these mucous membranes are also readily affected, it is sound to assume that some vital changes have also taken place in them 60 per cent of these children showed gastrointestinal symptoms, such as nausea, vomiting, diarrhea, and abdominal pain Moreover, five children, approximately 6 per cent, had musical rales all over the chest, with a cough similar to that produced by pertussis infection, but without the wboop

Description and Metabolism of Vitamin A

Vitamin A is a fat-soluble, viscous liquid, pale in color, and belonging to the benzece series as a primary alcohol whose formula is  $C_mH_mOH$  In animal tissue it is found in two forms, namely, vitamin A and vitamin A. Provitamin A (carotene) is found in the plant kingdom and is changed to vitamin A in the bodies of almost all vertebrate animals. It may be ingested in the form of alpha, beta, and gamma carotene and cryptovanthin, or as cod-liver oil or other fish liver oils. Vitamin A end carotene are absorbed from the intestinal tract and gain access to the blood stream by means of the thoracic duct. The vitamin concentration of the blood depends on the amount ingested with the diet, and the blood

serum normally contains approximately 0 11 ing per 100 cc. In the liver both vitamin A and carotene are taken up by the Kupffer cells and the latter is converted into vitamin A, probably by the action of some enzyme. Oils and fats favor absorption of vitamin A, but mineral oils impede it. Vitamin A is also successfully absorbed when it is administered by the hypodermic route. In man, about 95 per cent of vitamin A is stored up in the liver.

## Vitamin-A Deficiency And Its Effects

Many are the phenomena manifested clinically by the deficiency of vitamin A, but due to the scope of this paper consideration is given only to the process of keratinization, which affects the epithelial structures of the skin and the mucous membranes, and on the central nervous system. Externally, this deficiency facilitates the entrance of bacteria from without into the deeper structures of the skin, and systemically it lowers the body resistance to infection, since vitamin A is essential for the normal cellular metabolism of Inadequate intake or absorption of the body vitamin A or provitamin produces general disturbances which are followed by structural changes affecting, primarily, the epithelial structures These changes result in hyperkeratinization of the epithelium of the skin with atrophy of the normal epithelium and proliferation of the basal cells The keratinizing metaplasia may also take place in the ducts of the mucous or sebaceous glands, with cyst or abscess formation produced by the blocking of the lumen of the Some investigators have studied the effects of vitamin-A deficiency on the spinal cord and nervous system, and it is noteworthy to quote Sollman\* on this ground "Degeneration of the myelin sheath of peripheral nerves, especially the sciatic, and of scattered tracts in the spinal cord begins several days before other signs of deficiency appear in rats and increases to death with muscular weakness, incoordination, and final paralysis of the hind legs Its progress can be arrested by supplying the deficiency"

At this point it is logical to state that a great deal of our present knowledge on the deficiency diseases has been gained by animal experimentation, and this refers especially to vitamin A

#### Comment

As stated before, 98 per cent of the children admitted to St Francis Hospital suffering from poliomyelitis showed hyperkeratinization of the skin Children admitted for other diseases did not show this skin manifestation in the same frequency, the ratio being approximately eight to

It may be possible that this modified skin or mucous membrane may be one of the portals of entrance for the poliomyelitis virus, since the vitamin-A deficiency has diminished or impaired the normal resistance of these structures It is now known that this virus is highly neurotropic and that it travels mainly in the nerves through the myelin sheath I have also pointed out that vitamin-A deficiency also produces changes in the myelin sheath of the nerves, probably facilitating in this way the destruction wrought by the virus in the nerves and nervous structures. The final changes in the nerves, however, may be due to the combination of both factors, namely, vitamin-A deficiency and virus neurotropic action. In the group of 84 all except 2 recovered, only 2 were, unfortunately, unable to walk out This group of children came from all strata of social and economic life, they stayed in the hospital from four to six weeks, during which time they were properly cared for and fed by the Sister in charge of the ward The diet was well balanced and food containing vitamin A was freely administered At the time of discharge the lesions of hyperkeratinization had almost disappeared in all the children, with the exception of the 2 above noted who failed to recover completely min-A deficiency will produce keratimization of the epithelium of the skin and the mucous membrane of the conjunctivae, nasopharynx, the trachea, the bronchi, the urogenital system, the tongue, the mouth, and possibly the whole These structures, skin, gastrointestinal tract and mucous membranes, once affected by the keratınızıng metaplasıa, may become open doors for the entrance of the poliomyelitis virus into the human body

Two things may have produced the disappearance of the skin lesions, namely, the abatement of the poliomyelitic process and the proper dietrich in vitamin A. Two of the children in this entire group showed a yellowish pigmentation of the scleras and of the skin (vanthosis cutis), and this jaundice-like symptom may have been due to carotinemia. This further shows the part vitamin A plays in poliomyelitis.

## Summary and Conclusions

From my observations, I can definitely state that

1 Ninety-eight per cent of these children showed hyperkeratinization lesions due to vitamin-A deficiency. These lesions were present in children admitted for other diseases in the ratio of eight to one, that is to say, for every eight children admitted with poliomyelitis there was but one child showing the same skin manifestation who had been admitted for some other niment. Therefore, vitamin-A deficiency may be

<sup>\*</sup> Sollman, Torald A Manual of Pharmacology and Its Applications to Therapeutics and Toxicology, Philadelphia, W B Saunders Co., 1942, p 95

considered as a possible predisposing cause of poliomyelitis

- 2 Routinely, a diet rich in vitamin A should be administered to all children, especially during the periods of epidemics, and this diet should be supplemented by cod-liver oil or its concentrates
- 3 Since vitamin-A deficiency will produce keratinisation of the epithelium of the skin and the mucous membranes of the internal systems.

it is possible that these structures which have been affected by the keratinizing metaplasis are open doors for the entrance of the pohomyelitis virus into the human body

4 Finally, further investigation should be carried out lu this field, especially as to the treatment of pollemyelitis by an adequate amount of vitamin A, either by mouth or parenterally

#### THE PSYCHOLOGY INVOLVED IN A DIAGNOSIS OF CANCER

The psychologic approach of the physician in cancer cases is defined by the fact that he must communicate the diagnosis to someone. In the curable cases and in those in which prolonged treatment is required, it is rather essential to explain the situation directly to the patient. Here is where the fear, the ignorance, and the superstutors of the public complicate the picture. The patient must be fully informed of his chances by the physician, or the cooperation necessary in prolonged treatment will not be forthcoming

As in all situations there are exceptions. If the physician knows that the temperament of the patent will not stand for huntures, even in curable cases, then the most etable member of the family neutr be told. In the incurable cases, and in those that are concealed involving the internal organs, the patent should never be told, but again knowledge of the diagnosis must be transmitted to some

member of the family

The psychologic handling of the diagnosis begins with the first examination where one's susplicious are aroused. The breast fump is a good example because it illustrates a case in which permission for both hopey and probably subsequent radical operation are involved. By announcing that n hreast tumor may be innecent, "on the fence, or danger one, the groundwork can be laid. If biopsy shows that the tumor is innecent, there will be no need intriber surgery. If, however, biopsy shows that the tumor is on the fence or is one which if not removed will become dangerous, then it must be handled as if already dangerous and an adequate operation performed. This sumply means that when the patient finds the breast gone, shock is lessened by the belief that perhaps it was removed as a precaution and not because of necessity

In talking with patients during the dressing of the wound, the incresion is not revealed and, depending on their temperament, they are told that it was "on the ionce or had actually changed over to a dangerous type. Conversation can be directed to the early use of the arm to telling of patients who are alive ten or more years after operation, and other

such subjects.

There is a type of individual who may try to ex

tract a promise of being told all the facts as soon as the operation is completed. The very patient who must "know every thing" is the one most likely to become despondent and later fail to cooperate in

any way

In malignancy of the gastrointestinal tract, the use of the term 'constructing ulcer' has stood me in good stead. Never have I voluntarily told a pattent that he has an internal cancer, but if he learns of it later, I simply say that 'cancer' has usen ha disagreeable sound that in cases where I know that I have removed all of it I simply call it 'constricting ulcer' Then I advise the patient to use that term not only in talking with friends but also in his own thinking I it is a surprangly successful approach.

The psychology of obtaining permission for a permanent colostomy is most difficult. I frequently evade it Wherever it is possible, I avoid even a temporary colostomy, and in the hopeless situations where there is any suitable material, I do an anastomesis around the growth and close the abdominal wall. In doing this, the proximal loop is placed subcutaneously so that colostomy may be quickly completed at a later time if it becomes necessary. It is well to maintain the hope that the "constricting uleer" having been hypassed may so improve that some day it can be eliminated.

The depth of despondency reached by the patient with a permanent 'sogle barrel colottomy is dependent on his success in managing personal clean cliess. I have one patient who for seven years has taken great delight in coming to the hospital to persuade patients to permit it to be done. He uses the argument that he is sorry for normal individuals because he can keep himself cleaner than he could when normal. This patient fainted when originally asked for permission to perform the operation in dieuted.

As to relatives and friends, the physician can do much by assuring them that cancer is not hereditary, infectious, or transmissible by contact with patient or exercia.

May God forgive the physician who must every day thus apply psychology in his practice, and particularly in cancer cases—W B., in Pennsylvania, M J April, 1946

## CONFERENCES ON THERAPY

DEPARTMENT OF PHARMACOLOGY AND MEDICINE, CORNELL UNIVERSITY MEDI-CAL COLLEGE AND THE NEW YORK HOSPITAL, MARCH 15, 1945

THESE are stenographic reports, slightly edited, of conferences by the members of Departments of Pharmacology and of Medicine of Cornell University Medical College and the New York Hospital, with collaboration of other departments and institutions. The questions and discussions involve participation by members of the staff of the college and hospital, students, and visitors. The next report will appear in the September 1 issue and will concern "Penicillin"

## Digitalis versus Digitoxin

DR MCKELN CATTELL One of the important advances in digitalis therapy in recent years has been the increasing use of the purified glycosides. It is the purpose of the conference today to consider the advantages and the disadvantages, if there be such, in the use of these purified principles in relation to the standard experience with digitalis leaf

The announced title of the conference, "Digitalis vs Digitovin," can be broadened, I think, to include mention of any of the other glycosides which would be pertinent to this discussion. I might mention that the term digitovin is used in the broad sense to include such preparations as digitaline nativelle and purodigin (Wyeth). We are fortunate in having present today a number of cardiologists, and we hope we are in a position to give you evidence relating to some of the questions which may arise in this field.

Dr Gold will open the discussion with brief statements regarding the problem

Dr. HARRY GOLD There are four major criteria by which we select an oral preparation of digitalis One is that the material should be of high potency The more potent the material, the less glycoside needs to be administered, and since all the digitalis glycosides irritate the stomach, the less of it there is in the stomach the less the likelihood of local gastrointestinal distur-The first, then, is high potency Second, the potency should be uniform That does not require any further discussion than to point out that the intravenous animal methods of assay do not provide adequate uniformity of materials used orally in man The cat method fails to distinguish between absorbable and nonabsorbable glycosides because the method involves their being tested by intravenous injection The third is that the digitalis preparation should be rapidly and preferably completely absorbed from the gastrointestinal tract The fourth is fairly persistent action

On the basis of these criteria we have taken the position that digitoxin, or digitaline nativelle, is the material of choice at the present time for routine use The average digitalizing dose by oral administration is very small, smaller than in the case of any other glycoside or digitalis preparation in use at the present time. It is so small that there is rarely, if ever, enough glycoside in the gastrointestinal tract to cause nausea or vomiting by local irritation. It is practically completely absorbed from the gastrointestinal The doses by mouth and by vein are the There may be a slight difference, but if there is, it is outside of the range of detection in Digitalis leaf and tincture are different with respect to this point. In the case of digitalis the absorption is only about 20 per cent of the dose that is given. It requires about five times as much by mouth as by vein to produce equal In the case of lanatosid-C or cedilanid effects the absorption is only about 10 per cent of the dose, it takes about ten times as much by mouth as by vein to produce equal effects The duration of action of digitorin is essentially that of digi-We determined the persistence of talis itself action of digitalis and of digitorin in the same patients, and obtained two curves which are practically indistinguishable

With this material we have developed a method for digitalization in which we give an average full digitalizing dose at one time to induce the digitalis effects in an individual who has had no digitalis recently The dose is 12 mg of digitown or digitaline nativelle This is followed by a 02 mg tablet every day for maintenance the average individual, the 12-mg dose serves to digitalize and the 02 mg daily serves to maintain the effects There are a few in whom somewhat less than 02 mg is necessary for maintenance, so that after a time the dose has to be reduced to 01 mg daily There are a few also m whom the dose has to be increased Instead of 12 mg, it may be necessary to give as much as 2 mg to produce the full effects When we need to do that, what we do is to give 12 mg at one time and at the end of between four and six hours give another fraction, maybe 0 4 mg, or a smaller, or perhaps even a larger, fraction depending upon the circumstances These statements are fairly dogmatic and categorio, but perhaps I should leave my remarks at this point

DB. CATTELL I hope all of you will get a chance to hring up questions in relation to the problem which Dr Gold has just presented Would anyone who has had experience with digitoxin or other glycosides take exception to anything that has been said? We like particularly in these discussions to bring out divergence of opinion. Have you any comment, Dr Levy?

DR LEVY I would like to stress the variability in dosage and particularly in the mulntonance dosage. We have seen patients with auricular fibrillation who could be maintained at the proper rate, and by "proper rate" I mean one that does not rise above 80 under ordinary exertion, with as little as 0 1 mg overy second day. There are others who take 0 1 mg every day or 0.2 every other day. There are those, as Dr. Gold indicated, who require 0.2 mg. dady, which is perhaps the usual maintenance dose.

What I am about to say does not relate to anything Dr Gold monttoned We have made no formal study of digitoxin Our observations are based nurely on clinical experience. We have made no formal comparison between digitalis and digitoxin in the same patients, but we have used this drug in several hundred individuals There can be no doubt that a purified preparation which can be administered by weight rather than in terms of hiologic units is preferable for ordinary use So far the cost has been prohibitive as far as general hospital use is concerned. The therapeutic effects in our hands have been quite similar to those observed with digitalis in patients with failure with regular sinus rhythm and in those with auricular fibrillation. The toxic effects have been fewer As has been pointed out, nausea and vomiting are unusual, although we have seen them on occasion. We have seen two patients who complained of spots before the eyes, a digitalis effect with which we are familiar, which ceased when the drug was discontinued We have had no experience with the use of this preparation hy vein

It is my opinion that digitorin is at present the best preparation available for the routine functions of a digitalis glycoside

DR. CATTELL What dose do you start with?
DR. LEVY We have not been in the hahit of using one large digitalizing dose, because for the most part there is no hurry. We usually give 0.3 or 0.4 mg daily over a period of three or four days, and then go on from there necording to indications

DR. HAROLD STEWART I think our experience with desage here has been somewhat at variance with the amounts that Dr Gold has described

Last year we went through the record of all the patients in whom we had used digitalino nativelle here in the Hospital We found that it took from two to three times the 1.2-mg dose to slow down the ventricular rate in paticats with auricular fibrillation to an avorage rate of around 75 or 80 per minute. Only when the ventricular rate was around 100 or 110 per minute did we get adequate slowing to 75 or 80 by the use of 1.2 mg in the twenty-four hours. So the matter of dosage is not established, and certainly, accord ing to our experience, much larger amounts than those mentioned by Dr Gold are necessary In the etatement Dr Levy made about biologic assay. I think he meant to include the fact that no matter how purified the substance used, you still have to work out clinically how much of that particular preparation, glycoside la this instance, is necessary to do the joh, such as slowing down the vontricular rate is suricular fibrillation or whatever other clinical manifestation you wish to choose as your indicator

Choose as your indicator

Dr. Carr Egglestov I want to ask Dr
Stewart what the rate of administration was that
gave him these figures higher than Dr Gold's,
whether he used as a routine a large initial dose,
or whether his average is based upon a mixture of
small continued increments given over a period
of for tv-eight hours or so?

Dr. Stewart They were the amounts given in the first tweaty-four hours compared to the total amount required over the next few days to slow the ventricular rate adequately I think 0.8 mg was given as the first dose, and 1.2 mg was given in the first twenty-four hours As indicated, the veatmeular rate would still be up very high after 1.2 mg. The next day, maybe, we would give them the same amount and continuithem, maybe, three or four days on those amounts before we accomplished satisfactory slowing of the ventricular rate. At other times it was no longer procedure because we did not know exactly when we might run into texts effects.

Dr. CATTELL Dr Gold has given some special thought to the problem of variability in patients, not a wonder if he would say a few words about that and the relation of the variability in response to digitaxin and digitalis leaf

Dn Gold First, I should say that It would not be remarkable if the experience with fractional doses given over twenty-four or more hours differed from experience with the single large dose. Since Dr Stewart did not give 1.2 mg nt one time but spread it out over twenty four hours, his experience and ours are not comparable. Second, one should not be at all surprised it one encounters cases requiring more than the 1.2 mg to digitalize fully.

While the matter of individual variability in

dosage which Dr Stewart and Dr Levy emphasized is very important, we should not lose sight of the meaning and value of the average. The 1.2 mg is approximately the average digitalizing dose. One cannot expect very many people to show precisely the average susceptibility. The question, then, is how many come close enough to make it a useful value.

We have some information about that prepared a distribution curve of digitalis action by oral administration in man The curve shows how variable the human population is in response to oral digitalis, and was prepared from the threshold doses causing a digitalis effect If one takes the mean as that dose which causes the specified effect in 50 per cent of the patients, the curve shows that doses between 25 per cent below and above the mean will include 70 per cent of the population Such variation in dosage could barely be detected in clinical digitalization spite of the fact that patients vary in susceptibility, the curve indicates that the average dose of 12 mg of digitoxin or digitaline nativelle given at one time should do an excellent job in about three fourths of the cases Obviously, the remaining fourth will do well with less or will require more

DR CATTELL Upon how many cases is this curve based?

DR GOLD It is based on 833 single doses in 84 patients

DR EGGLESTON What were the criteria for judging the effects in these patients?

DR GOLD We took for the curve the smallest dose which caused a change in the T-wave of the electrocardiogram when examined by the blind test as in the method of the human assay of digitalis

DR EGGLESTON Patients were not necessarily in cardiac failure when digitalis was given?

Dr Gold No, many of them were not would like to stress the fact that the single-dose method has a real advantage One of the strong points about digitovin, or digitaline nativelle, is that it is the only material which we know at present which we can give in an average full does at one time without encountering trouble have now approximately 1,000 single-dose digitalizations with 12 mg Local gastrointestinal irritation or toxic effects are negligible The safety of this procedure is now beyond question method has the advantage of contracting the period of digitalization from the usual twentyfour, thirty-six, or forty-eight hours down to a period of six to ten hours

DR LEVY May I say, Dr Gold, that one of the reasons we have not used the single-dose method as the routine is that so often one is not sure whether the patient is taking digitalis, and if he

has, how much he has had I don't mean to say that we have not used that method, but as a general rule we prefer the more gradual method for the reason given

DR Gold That is certainly an important reason. If one does not know, one should have to use the divided dose method. But if the patient has taken digitalis, and you know how much, there is a simple calculation for shifting to digitation. Decide how much digitalis he needs in grams and give him digitation, or digitaline nativelle, the same number in milligrams. If, for example, the patient is taking 0.1 Gm of digitalis daily, a daily dose of 0.1 mg of digitation, or digitaline nativelle, will take its place. A dose of 1 Gm of digitalis has the effect of 1 mg of digitation, or digitaline nativelle. On this basis the shift from one to the other is very simple.

DR STEWART Could we go back to that chart a moment? Does that have anything at all to do with the clinical use of digitalis? The chart is based on the T-wave changes, and the T-wave changes cannot be used as evidence of the therapeutic quantitative effect in taking care of, we will say, any individual patient, so the chart really does not have any bearing on the clinical dosage of digitalis

DR GOLD I am afraid I failed to make my point clear The distribution curve in question, based on a fair sample of patients, merely shows how variable the human population is in the response to oral digitalis. It shows that the most susceptible requires about one third as much as the most tolerant, and that about 70 per cent of them are affected by ±25 per cent of the average dose. That description of the human population susceptibility was made in terms of the effect of digitalis on the T-wave. The whole thing is a standard procedure for describing the characteristics of a population

DR STEWART I still think this chart and this part of the discussion have no bearing on the matter we started to discuss

DR GOLD On the contrary, it has a direct bearing on the discussion. We started out to discuss the average single dose of digitorin. You implied that an average single dose at one time could not be used because individual susceptibilities vary too much. Our distribution curve shows that they are not so variable as you make them out to be and that the average dose given at one time may be expected to do an excellent job in 70 per cent of unselected cases.

DR CATTELL Isn't it a fact that the relationship you observed using the T-wave also applies to the heart rate changes in auricular fibrillation?

DR GOLD I am glad you brought that up In the assay of digitalis, we have found that if two preparations show a certain relative potency

when compared by the T-wave method, they give the same answer when tested in patients with auricular fibrillation in terms of slowing of the vontneular rate. We have a chart here of 40 patients with auricular fibrillation. They were maintained with a daily dose of 0.2 Gm of New York Heart Association digitalis for several weeks in one period, and with 0.2 mg of digitaxin, or digitaline nativelle, in another period. The human assay, using the T-wave, hy which the drugs were compared showed a potency ratio of 1.000

This is now confirmed by this group of fibrillators. With the dose of digitoxin 73 per cent of the patients maintained an average rate between 60 and 90. With 1,000 times as much digitalis 70 per cent of this group of patients

maintained the same rate I should call your attention particularly to the fact that an average single daily maintenance dose of 0.2 mg of digitorin did a very good therapeutic job in 73 per cent of a group of fibrillators Also, there is the fact that there was no poisoning in even the most sensitive members of the group You will recall from the length; discussion of our distribution curve in which the T-wave mothod was used, that about 70 per cent of the population may be expected to secure very satisfactory digitalization from an average dose of digitoxin given at one time, and a dose = 50 per cent of the average is not likely to produce serious under- or overdintalization Patients therefore, are not so variable that an average dose at one time cannot be used with advantage, whether it be for maintenance or for initial digitalization.

Dn. C H Wheeler Dr Gold, it seems to me that some of the difference in views here may be resolved by difference in the enteria used for satisfactory digitalis effects. Our experience in the New York Hospital has been that the average effective dose of the Now York Heart Association digitalis is 1.8 Gm, in other words, on the average you have to give that amount to obtain the effect which we consider the optimal action of digitalis. You would say that 1.2 Gm of digitalis for the average should give a reasonably equivalent effect.

DR. CATTELL I think that by Dr Stewart's method of administration of divided doses, Dr Gold's figure would come much nearer the 1.8 Gm

DR. WALTER MODELL If the 0.2 mg daily maintenance dose is started the morning after the initial digitalizing dose of 1.2 mg, the total amount of digitalin nativelle, or digitation, turns out to be 1.4 to 1.0 mg in the first twenty-four to forty-eight hours

Dr. Stewart I mean we use the slowing of the ventricular rate in auricular fibrillation as a guide We don't think we have achieved a good effect unless we get a good slowing and a ventricular rate to around 70 or 80 per minute.

Dn. Gold Do I understand correctly, then, that if you were giving digitaxin you would give closer to 2 mg for the average person?

DR. STEWART I think that would be the amount that would more nearly do what we

wanted it to do
Dn. Gold I take it, then, that your previous
statement that in the New York Hospital it took
from two to three times our 1.2-mg dose to slow
the fibrillator adequately applied to some special
cases, not your usual ones, for this would make
the dose from 24 to 36 mg I should mention
that in one of our papers we stated that of 98
ratients who received 2 mg at one time. 21 per

cent vomited in an average of aix hours

No I don't think there is so much difference in the criteria for digitalization which the two groups use. The differences lie elsewhere. Your experience covers a relatively small number of patients and ours very large numbers. Yours are ward patients. Ours are both ward and ambulant clinic patients. The "average" has to include the numbulant fibrillator with moderate signs of failure. The more advanced cases are the ones that you get in the ward. I should expect that on the wards the average does would turn out to be somewhat higher. I also believe that an important difference hes in the method of administration. You give fractions over twenty-four hours or more and we give the angle dose.

Did I understand you to say, Dr Wheeler, that 1.8 Gm of digitalis is your average dose, or is that the dose which fully digitalizes everybody?

Dr. WHEELER After the preparation has been standardized on a large group of fibrillators, it has been observed during many years on the medical service in the New York Hospital that 1.8 Gm of digitalis in twenty four hours was on the average effective and not toxic

Dr. Gold It is rare for you to need more than that, isn't lt?

DR WHEELER I think that is true

Dr. Stewart That would include all patients, ambulatory or not We used the same amount

DR Gold And 1.8 Gm did the job in practically all of them?

Dn Stewart Yes, patients very sick or not very sick

Dr. Gold Then you are not really using the average dose but the maximum dose, for it is self-evident that only the maximum dose could produce the full effect in everybody

DR STEWART It depends upon what you decide upon for your criteria of the effect you want to achieve With a dose of 1.8 Gm nausea

and vomiting are unusual In my experience this amount will slow the ventricular rate in most patients with auricular fibrillation accompanied by rapid ventricular rate irrespective of whether heart failure is or is not present

DR Gold I find it difficult to understand the fact that in the early part of this conference individual differences in susceptibility were stressed and the need for determining the dose in every case, and now Dr Stewart states that almost everybody needs the same dose

Also, we have got to come to terms with the meaning of the words "average dose". The average dose does not produce the effect in every patient, any more than an average-size hat fits every head. It is a matter of definition. Our distribution curve demonstrated this fact.

DR STEWART It may be so for the T-waves, but I am speaking of slowing the ventricular rate

DR GOLD It involves a fundamental law of biology The method of measuring, whether by T-waves or heart rate, has nothing to do with it The average dose simply is not something that will produce the same effect in everybody

DR LEVY It seems to me that what you are interested in is really the range of doses necessary for the digitalis effect rather than the range of effects for a given dose as you have in your curve I am not attempting to disagree with you, but it does seem to me more important to stress the range of doses than the average, which after all in any individual case is relatively unimportant except as a guide

DR Gold In a sense, that is precisely what we have shown We stated the average dose, this is always the starting point. We have shown that three fourths of the patients will do well with that, and that in the remaining ones it will be necessary to decrease it or increase it by as much as 50 per cent.

DR HAROLD PARDEE I think there is one other aspect to this which is important. You indicated that in 2.8 per cent of your patients there were minor toxic effects after a single 1.2-ing dose. Do you know in what percentage of that group there were therapeutic effects?

DR Gold As to the toxic effects, about 1 per cent showed vomiting. We have never made a distribution or a scatter curve of the therapeutic effects of the 12 mg given at one time. We have made the scatter curve with the maintenance dose of 02 mg, which we have just discussed. The answer there, as you may recall, is that if you give 02 mg, daily for maintenance, three quarters of the cases of auricular fibrillation are maintained at a rate level which varies between 65 to 90. We have not done this yet with the single-dose digitalization.

DR PARDEE It seems very important to do

that because Dr Stewart has found that he must use a larger dose than you have suggested, and the difference in the time of administration according to his account is relatively small. You give it in one dose whereas he spreads it out over the day. It seems to me that if your dose gives only 28 per cent tooic effects, it must be smaller than the average

DR GOLD While we have not determined precisely what proportion of patients are fully digitalized by the 1 2-mg dose given at one time, we do have some information about that dose, since it produces an effect equal to that of 12 Gm of digitalis Dr Modell has assembled some of the observations in the literature

DR MODELL I have here some notes might start with the paper by Dr Cary Eggleston in 1915, in which he found that the average digitalizing dose of digitalis given orally to man in divided doses in the form of the tincture or infusion is 0 146 cat unit per pound of body weight There is the paper by Dr Harold Pardee in 1919 in which he stated that the average amount of tincture he required to produce full therapeutic or early toxic effects were in full agreement with Eggleston's figure Then there is the paper by Dr Canby Robinson in 1920 in which he used from about 15 to 25 cc of the tincture in a single dose, with a fairly high incidence of toxic effects There is a report by the Council on Pharmacy and Chemistry in 1924, signed by Drs Robinson, White, Eggleston, and Hatcher, in which the total average oral dose of fairly active standardized digitalis for inducing full therapeutic effects in an adult who has not received digitalis within ten days was given as about 15 Gm of leaf administered in divided doses over thirty-six to forty-eight hours There is also a paper by Hermann in 1944 in which he quoted Stroud as suggesting that the maximum dosage of digitalis leaf to patients who had had none previously should be fixed at 12 Gm in divided doses

DR GOLD Here we are with a batch of figures on digitalis all the way from 1 2 Gm to 1 8 Gm as the full digitalizing doses. There are undoubtedly several factors which account for the differences, such as differences in potency of the drug, differences in criteria for full effects, and differences in the schedules of administration. It seems to me that 1 2 Gm comes nearer to the average requirement for the single dose than 1 8 Gm, especially since these experiences are based largely on the divided-dose methods.

DR CATTELL There is one point which I think deserves special emphasis, and that is the relationship between digitovin and digitalis leaf. In a very large number of assays and in various methods of study it has uniformly appeared that the glycoside is one thousand times as active as

digitalis leaf by oral administration in man. The equivalent of 1.2 Gm of digitalis is 1 2 mg of the glycoside. If a particular patient shows special resistance or susceptibility to one of the materials, you will find him equally so to the other. I think that that stands

Dr Eggleston, you have not said much

Dr. Eggleston No, I have been very much interested It is very rare that during a man'e lifetime he sees a figure of his come out as close to 146, as the average between 1.2 and 1.8 Frankly, I am not only surprised hat a bit over-

wholmed hy that very idea

As n matter of actual fact, I think that these divergencies of opinion are reconcilable lieve that in everything Dr Gold has said he has been perfectly correct, granted the conditions under which he has reached his figures I also think that Dr Stewart is essentially correct, granted the conditions under which he has reached his figures Dr Gold has been looking for a whole lot of things here which we will not discuss individually, but he has been looking for this figure wilch he did not know at that time was 1 2 Gm, and which experience has shown will produce a definite and predetermined change by his criteria of measuring change, namely, alterations in the T-wave or RT segments of the electrocardiogram Dr Gold is using the high powered iens on his microscopo Circumstances force clinicians in general to work with the lowerpowered iens They try as hard as they can to produce desired effects within as short a space of time as is reasonable, and at the same time try to avoid the introduction of serious toxic phenomena We all know, who have had any experience in treating cardiac patients, that once you induce nausca and vomiting of severe degree hy excessive digitalization, you have opened up the likelihood that that patient may become, psychologically at least, resistant to digitalis You know that in the future, in all human probability, it will be necessary to maintain digitalization at a satisfactory level in that patient, so that you run the risk of defeating your own pur-I am very sure that the three clinical cardiologists here who have spoken have had that in their minds when they have been working on dosage of digitalis Dr Gold has looked for the absolute figure, as near as he can approach it, of the average As he has so very well emphasized. the absolute average is going to mean that there will be a considerable spread on either side of that average, a spread which he has included in his 25 per cent below and 25 per cent above the It seems to me, therefore, that average dose these views are reconcilable on the basis that it is a workable average to begin with 1.2 mg of digitoxin or 1.2 Gm of digitalis to start your patient off on the road to adequate digitalization But I know that Dr Goid, as well as the others here, uses sound medical judgment in determining how much more or less digitalis the individual patient is going to require for digitalization as well as for maintenance So I don't think the disharmony is quite as great as at moments during the discussion it may have seemed to overybody

DR WHEELER Dr Eggieston, may I ask you to what proportion of the patients digitalized in the past year have you given a digitalizing dose at

one time?

DR EGGLESTON I did not care to bring that up, because I nm not fully in harmony with the idea that clinically we need to digitalize the average patient with cardine failure with any such degree of rapidity as the administration of an average dose of 1.8 Gm. of digitalis or of 1.2 mg of digitorin, and I have been out of agreement with both Dr Gold and Dr Stewart in that practice I like to introduce 1.8 Gm., or thereabouts of digitalis or the corresponding dose of digitaxin within a period of twelve to twentyfour hours hecause, sure as I may be of the activity of the drug, I am never quite sure of the susceptibility or sensitivity of the individual patient, nor quite sure that he is telling the whole truth when he insists that he has not taken digitalis before I have encountered a number of experiences in which it was possible to prove that the patient was not telling the truth and, because of this, we have produced serious intoxication.

Dr. Wheeler Do you prefer not to answer

my question?

Dn. Eggleston That is the only way I can answer it I don't usually give the single dose

DR WHEELER How often have you done it?
DR EGGLESTON I don't know That would
be pure guesswork I don't often use 1.2 mg as
m mittal dose I suppose my general practice is
to give from 0 4 to 0 6 mg as an initial dose, and
then a second dose of 0 4 mg, and go on from
there until I have gotten approximately 1.2 mg
into the patient within twenty four hours

DR STEWART What have you found as your average digitalizing amount with digitaline nativelle?

Da Eggleston I should say about 1.5 mg on the basis of the patients who have taken it I think that a good many need more than the 1.2 mg, just as you think. On the other hand, I feel that the average maintenance does of 0.2 mg is not infrequently a bit above requirements, and that as Dr Levy pointed out many patients are well maintained with an average maintenance does of 0 1 mg a day

DE CATTELL I would like to point out that this figure of 1.2 mg is based not only on the electrocardiogram but was also arrived at in cases of auricular fibrillation, a very large number of them

This is precisely the case came by the figure 1.2 mg not through theoretic considerations but through the laborious method of trial in patients with auricular fibrillation and Early experiences showed that heart failure 1 mg or less was not sufficiently effective, and that a single dose of 2 mg gave too high an incidence of minor toxic reactions (21 per cent The proper dose obviously lay bevomiting) tween these points An extensive trial of a single close of 12 mg, now over 1,000 cases, gave an incidence of vomiting of about 1 per cent From the standpoint of toxicity, we regarded this as satisfactory I doubt very much that any system of digitalization with the leaf, tincture, or purified materials in the hands of the average physician gives as good a toxicity record as that We found that the incidence of satisfactory therapeutic digitalizations by this dose was very high can get some idea of what you may expect therapeutically from this dose by considering the fact that the 12 mg is equal in effect to 12 Gm of digitalis

The total experience with this and with digitalis indicates that the 12 mg is fairly close to the true "average dose" in the distribution curve of human sensitivity I doubt that the point can be fixed in man with much greater precision. We have some experience now indicating that it may be possible to use 1 5 mg at one time, giving the therapeutic advantages of this larger dose without materially increasing the incidence of toxicity This needs more study But the general practitioner need have no hesitation in using the 12 mg dose at one time for routine digitalization He cannot give the equivalent 12 Gm of digitalis at one time because the local gastrointestinal irritation will cause nausea or vomiting in from 10 to 20 per cent of the cases

DR CATTELL The fact that the 2-mg dose caused no serious poisoning indicates that even a partially digitalized patient would not be in danger from the single dose of 12 mg

DR GOLD That is correct

DR Modell The greater cost of digitalization with digitaline nativelle or digitorin is often brought up I thought you might be interested to know the extent of this difference I have

data on what it would cost the patient if he brought his prescription into one of two reputable pharmacies in this vicinity, and what it costs two hospitals in this city which purchase both drugs in large amounts The figures I have are based on the cost of the 0.2-mg tablet of digitaline nativelle and of the commonly available 01-Gm tablet of digitalis leaf In these cases the patient pays 24 cents for digitalization with 1.2 mg of the glycoside and 14 cents for digitalization with 12 Gm of digitalis leaf For maintenance, it costs the patient \$1 10 for 50 daily doses of 0.2 Gm of leaf (2 tablets of 0 1 Gm) and \$2 00 for 50 daily doses of 0 2 mg of the glycoside The hospital, of course, pays considerably less for drugs, here digitalization with the leaf costs about 4 cents and with digitaline nativelle 8 cents, and maintenance costs about 25 cents for 50 doses of leaf and 65 cents for a similar number of doses of the glycoside

## Summary

Dr Gold At the outset of this conference, the statements were made that digitaline nativelle or digitovin is at present the material of choice for routine digitalization, that the preferred method of administration is to give 1 2 mg at one time followed by a daily maintenance dose of 0 1 to 0 2 mg, and that this method shortens the period of digitalization from the usual twentyfour to forty-eight hours for digitalis down to six to ten hours The issues involved were thoroughly explored with the participation of several While there were outstanding cardiologists several fundamental points of accordance, the discussion brought out sufficient disagreement to suggest that the reader might do well to analyze the evidence and arrive at his own conclusion The discussions covered such matters as the relative ments of digitalis leaf and digitovin, problems of absorption, local gastrointestinal irritation, the single-dose method, the application of the human method of digitalis assay by the electrocardiogram to the therapeutic potency of digitalis in auricular fibrillation, criteria for digitalization, incidence of toxicity, the meaning of the "average dose," the range of variation in the sensitivity of humans to the action of the digitalis group, and the problem of comparative costs

## SLOW-GROWING HYPOPHYSEAL TUMOR ASSOCIATED WITH HYPOTHYROIDISM—A CASE REPORT

HARRY SWARTZ, Capt ,(MC), AUS

(From Tilton General Hospital, Fort Dix, New Jersey)

THIS case is recorded because it points the fallacy of considering the endocrine glands as other than specific anatomic units ineffably bound in a single interplaying physiologic system because it rance certain interesting speculations, and because it presents an unusual finding

#### Case Report

J A. I. a 32-year-old soldier, was born in Glasgow, Scotland When the patient was 3 his family physician who had delivered him placed him on thyrold maintaining him on a dose of 1-3 grains daily Ho completed high school at the age of 17 and migrated to the United States Here, conand migrated to the United States Here, continuing his thyroid litake, he held a variety of unskilled and semiskilled jobs, supporting himself quite satisfactorily. In April 1942, he was inducted into the Army and shortly thereafter was sent to England. He functioned well in the service until December of that year, when he was hospitalized with bronchopneumonia. During this hospitalization he falled to take the thyroid. No ill effect was noted from this omission except a slight weight gain after which he was again placed on maintenance dose of thyroid, on which he remained throughout an inneventful hospital stay and for several months thereafter. several months thereafter

In April of 1943 his supply of thyroid gave out and he made no attempt to replenish it. Gradually and he made no attempt to repusion at the characteristic began to notice increasing weakness, anoraxia, weight gain, occasional substernal oppression, and record eleving down of all his activities. The seneral slowing down of all his activities. The latter became so marked eventually that his fellow soldiers began calling him 'Speed' In addition, he began to experience occasional 'staggering spells which came on after walking a mile or farther Several times he was picked up by military police for intoxication More than once, he found he could propel himself no longer and was compelled to lean against a tree for support or fall to the ground. A mild form of hariness before the eyes appeared on occasion. Finally, he sought medical and and was hospitalized in August, 1943

Physical examination during this hospitalization rhysical examination during this hospitalization revealed pulliness of the face, a pulse of 60, and blood pressure, 100/80 His beight was 65 inches and weight, 180 pounds. No gross abnormalities were noted. The basal metabolism rate was -40 per cent and -37 per cent. Blood cholesterol was 248 mg per cent. Total protein was 8.1, with nor mal alnumin-globulin ratio The hiood pleture showed a perisstent secondary anemia with a count of 34 million red blood cells and hemoglobin 60 per cent. Serology and urnnalwis ware neartine of 34 million rod filood cells and hemoglobin of per cent. Serology and urnalysis were negative Intake and output were normal. Electrocardiogram showed normal rhythm, rate 60, conduction normal with a PR interval of 0.2 seconds, T<sub>2</sub> low low voltage QR-S complexes, La normal slight axis deviation. Fluoroscopy revealed normal lungs and diaphragm, he had a slow, regularly beating beart with low samplitude. with low amplitude.

A diagnosis of myxedema was made and he was placed on thyroid, 3 grains daily After six weeks

there was subjective improvement but the hasai rate remained the same. He was evacuated to the Zone of the Interior and arrived at this hospital on

September 19, 1943.

Physical examination here revealed a pallid white man appearing ten years younger than his age, with a general puffiness about the face and a paucity of facial expression. Head hair was abundant, dry, and somewhat brittle. Trunk and limbs were hairless except for n scant amount in the axillae and the public trigone. The skin was of normal turgidity with no evidence of coarseniog Perspiration was absent except in the axillae and palms. The pelvis was wide with a mild girdling of lat. The buttocks were of the feminine contour. Penis and testes were of normal size The thyroid was not palpable. The tongue was normal but the speech was thick and slow with a suggestion of the speech was thick and slow with a suggestion of the propulsive. The anteroposterior diameter of the skull was exag gerated. Pupillary referes were normal. There was a functional murmur in the pulmonic area. Blood pressure was 120/80, and pulse, 80

With these suggestive findings, the patient was questioned more closely. He had begun to chave at age 20 and had continued to do so about once a careful. He had regard and inclined

week. He had never had intercourse but claimed normal erections and occamonal nocturnal emis-sions. There was no special cold intolerance.

Psychiatric examination revealed no untoward psychopathology Psychometric testing showed an I.Q. of 97 Careful examination of the eyes showed a convergence insufficiency of the ocular muscles and moderate hasiness of the nasal margins of both optic disks, more marked on the right, with no evi dence of edema or hemorrhage. Visual field studies revealed a slight constriction in the right temporal

Electrocardiogram and electroencephalogram were entirely normal. The basal metabolism rate was 12 per cent. The blood chemistry was normal, with slight elevation of the chlorides (600 mg per cent) Glucose tolerance test showed a flattened curve (80-105-70-81-74) with no urinary spill. The blood picture continued to show a mild second-

ary anemia with normal white count and differential.

X-rays of hands and feet were normal X-ray of the skull showed a thinning of the frontal and parietal bones, marked onlargement of the sella with an anteroposterior diameter of 28 mm. and a depth of 18 mm The floor of the sella was a deput of 10 min and so that they tended toward a vertical position anterior clinoids were normal (Fig. 1)

Unfortunately, facilities for hormonal studies were not available The patient was observed for several weeks and was eventually soparated from the service relatively asymptomatic. Because of the service relatively asymptomatic. Decause of the extensive bony destruction and the large size of the tumor mass it was felt that surgery was con traindicated. Since the literature reports deep x-ray radiation of little, if any value this therapy was not attempted in the service. He was advised

, ---

Fig 1

to report to the Veterans Facility nearest his home for prolonged observation and x-ray therapy at the discretion of the officer in charge — As far as is known at this writing, he is still about in civilian activity

#### Discussion

Because this case stirred interest, an unsuccessful attempt was made to communicate with his family physician in Glasgow. It was felt that a detailed description of the infant and childhood years would be illuminating. As far as could be determined from the patient, a skull film had never before been taken.

The well-known relationship between the thyroid and pituitary gland raises the question as to the original site of the malfunction. Was the tumor the end result of excessive secretion of thyrotropic hormone in response to an afunctioning or hypofunctioning thyroid? Or was the tumor the result of strictly intrahypophyseal influences eventuating (by mechanical pressure) the inactivation of the thyrotropic secretory cells and thus secondarily producing hypothyroidism? Or was this tumor, perhaps, entirely coincidental in an individual with juvenile hypothyroidism?

The latter possibility cannot be ruled out, of course The only fact that militates against it is the

definite and specific relationship that exists between thyroid and pituitary Conversely, however, pituitary tumor is a rare concomitant of cretinism or hypothyroidism

There is objective evidence, however, that the tumor probably developed after the onset of thyroid malfunction in that the latter deficiency was discovered in early childhood and the patient in maturity presented normal genitals and a skelcton normal in size and development. Only the secondary sex characteristics were affected, i.e., female birsutism, suggestive female adiposity and possibly a decreased potency. Furthermore, the premise that the tumor or pituitary malfunction was primary and the thyroid deficiency secondary would predicate the functional disturbance of a single and specific type of secretory cell, namely, the thyrotropic. This seems unlikely

With the objective evidence presented, the time of onset of this tumor can be speculated upon Since the tumor is of large size and the bony destruction in the sella and sphenoid sinus great, and withal there were no symptoms of increased intracranial pressure or of impingement on surrounding structure, it is safe to say that this tumor is of very slow growth. Since the genitals and skeleton are fully developed, it would seem that it originated some time after puberty and after epiphyseal closures. It is therefore within reason to state that this growth is ten to fifteen years old.

It is also of interest to note that despite the unusually large size of this mass, the only evidence of chiasmal injury is a slight notching of the right temporal visual field. Noteworthy is the fact that this patient escaped an x-ray of the skull over the course of so many years and that the obvious signs pointing to some operative factor other than thyroid deficiency were either overlooked or assigned to thyroid deficiency.

#### Summary

A case of slow-growing pituitary tumor associated with hypothyroidism is presented. The tumor is unusually large. Its relationship to thyroid deficiency is discussed. The importance of considering the endocrine glands as anatomic units of a single interplaying physiologic system is pointed out.

# POST-TRAUMATIC PNEUMOCOCCAL (TYPE III) MENINGITIS RECOVERY WITH SULFADIAZINE AND SULFAPYRIDINE

S A Vogel, Lt Col, (MC), AUS, E H Mateer, Capt, (MC), AUS, and J Hunter, Capt, (MC), AUS

(From the 10th Station Hospital)

PRIOR to the introduction of sulfonamides the mortality from pneumococcal meningitis was practically 100 per cent Ruegsegger's analysis of 630 cases of pneumococcal meningitis at the Cincinnati General Hospital showed no recoveries before

1937 With the introduction of sulfapyridine the number of reported recoveries has steadily increased until now the estimated mortality ranges from 60 to 80 per cent. The greatest mortality occurs in the very young and those over 40 years of age. Serum

in conjunction with sulfonamides has been used frequently, particularly in the types III and V pneumococcal infections <sup>2</sup> Finland <sup>3</sup> has stated that recoveries from pneumococcal meningitis were as frequent using sulfonamides alone as when combined with serum, and added it was reasonable to suppose that serum saved a large proportion of patients who were doing poorly on chemotherapy alone

The following case belongs to that group developing meningitis secondary to head trauma. Admittedly, the prognosis here is better than in those cases occurring secondary to pneumonia. Although this soldier had a type III pneumococcal meningitis it was felt justifiable to give chemotherapy a twenty-four-hour trial before resorting to the use of serum

#### Case Report

On May 4, 1943, at 1 30 a.m. a soldier, age 24, was admitted to the Surgical Service with multiple injuries sustained in a serious motor vehicle accident He was irrational and restless and had an extensive laceration of the right brow extending across the nose and down into the right eyelid. The nasal nose and down into the right eyelid bones were fractured but no break into the cranial There was no vault was demonstrated by x-ray leak of eerebrospinal fluid from the nose Blood and spinal fluid were escaping from the left car, suggesting a fracture through the petrous bone into the middle fossa All eye signs were normal was a simple fracture with over-riding at the junetion of the lower and middle third of the right femur The temperature and blood pressure were within normal limits and there was no evidence of serious shock. The laceration was sutured and the femur placed in suitable traction.

During the next thirty hours the patient's general eondition improved. He became quiet and rational with a pulse rate of 92, blood pressure of 128/68, respiratory rate of 24, and a temperature of 100 F. The only disturbing sign was persistent cyanosis for which there was no apparent explanation. No lung pathology was demonstrated either by physical examination or by x-ray. The circulatory system appeared to be functioning normally and no medication capable of causing cyanosis had as yet been

given.

On May 5, 1943, the systolic blood pressure began to rise, with a slight fall in the pulse rate, and the temperature rose to 101 2 F Sulfadiazine, 1 Gm every four hours by mouth, was started Throughout the day the systolic blood pressure, temperature, and respiratory rate continued to rise, the pulse rate remained in the nineties and the diastolic blood pressure fell steadily After thirteen hours the temperature had reached 104 4 F and the blood pressure was 170/50 The pulse rate was 88 and the respiratory rate 46 He was again irrational and restless and although there had been no vomiting he had voided once involuntarily At this time there was some nuchal rigidity, slightly hyperactive reflexes, and a marked carpal spasm.

On May 6, 1943, although detrimental to the immobilization of the fractured femur, a lumbar puncture was necessary for diagnostic as well as for therapeutic purposes. This lumbar puncture was done under intravenous pentothal anesthesia, as were all the others on this case. Memngitis and cerebral contusion with or without intracramal hemorrhage were suspected. The cerebrospinal fluid was turbid and blood-tinged and the pressure was over 600 mm of water. Eighty cc of spinal fluid was withdrawn and the pressure lowered to 200

Examination of the ccrebrospinal fluid showed a white blood count of 1,500 and a red blood count of 2,500 There was diminished sugar Gram-positive diplococci, which later proved to be pneumococci, type III, were found in the smear At this time 5 Gm of sodium sulfadiazine in 100 cc. of water was givon intravenously A lumbar puncture again showed a cloudy, blood-tinged fluid under 400 mm pressure Twenty-five cc was removed, 400 mm pressure which lowered the pressure to 200 mm. Culture of this fluid was positive for pneumococci, type III The blood sulfadiazine lovel was 12 5 mg per cent The physical signs had not changed The carpal The physical signs had not changed The carpal spasm was believed to be due to hyperventilation, as the respirations had been averaging about forty per minute for the previous twelve hours 10 cc of 10 per cent calcium gluconate was given intravenously in order to relieve this carpal spasm Another 5 Gm of sulfadiazine was given intravenously at 11 30 A M Because of thoreported success with sulfapyridine in similar cases, a change to this drug was made at 4 00 PM, 1 Gm was given every sıx hours by mouth

During the next twenty-four hours marked improvement took place. His temperature fell to 1002 F and the blood pressure to 130/70. The pulse rate was 92 and the respiratory rate 24. He was rational, cooperative, and toward the later part of the day was enjoying a cigarette and asking for food. The blood sulfonamide level had dropped to 59 mg per cent, so, in order to raise this level, 5 Gm. of sodium sulfapyridine was given intravenously in two divided doses during the day, and the oral deage schedule was changed to 1 Gm, every four hours.

On May 8, 1943, four days after admission, the spinal-fluid pressure was only 290 mm. The white blood count was 1,720, and the red blood count, 3,350, the sugar was only slightly diminished. Blood and spinal-fluid sulfonamide levels were 81 mg and 83 mg per cent, respectively Apparently the sulfonamide was being concentrated in the spinal The eyanosis that had been presfluid at this time ent since admission had increased slightly, although the heart and lungs still showed no abnormal signs on physical examination On May 9 the patient again became restless and uncooperative temperature remained between 100 F and 101 F By May 10 the and the cyanosis had deepened spinal fluid was much clearer and only 650 cells per The blood and spinal-flud cu mm. were present sulfonamide levels had dropped to 54 mg. and 35 mg per cent, respectively Again the dosage of sulfapyridine was increased to 8 Gm a day (1 Gm. every three hours) The next day there was marked improvement There was less cyanosis, the temperature fell below 100 F, the pulse rate ranged around 80, and the blood pressure was in the neighborhood of 120/70. The patient was again rational and cooperative, with only slight nuchal nigidity. It was evident that a lower blood sulfon amide lovel was adequate and the sulfapyridine dos-Because his hemoage was dropped to 6 Gm a day globin had fallen from 85 per cent to 72 per cent, he was given a transfusion of 500 cc of whole stored Both spinal-fluid specimens taken on May 12 and May 14 were clear, with cell counts of 90 and 6, respectively A slight xanthochromia was noted on the specimen of May 12 A blood sulfonamide level of 11 mg per cent was present on May 13 and the sulfapyridine dosage was further reduced to On May 20 it was again lowered to 2 3 Gm a day Gm daily and finally discontinued on May 24 second whole-blood transfusion of 500 cc was given on May 15 No elevation of temperature over 99 F

occurred after May 17 General improvement continued and by May 24, twenty days after admission, be was considered to have recovered from the active pneumococcal infection of the meninges. During this illness his fluid hake ranced between 2,000 and 3,000 cc daily and the urnary output remained above 1,500 cc. A slight discharge from the left ear continued until about June 15 Three months later there was no ordenee of meningeal irritation or other sequelae. He was sent to a general hospital for the final healing of the fractured femur and for additional plastic repair of the right veglid

The more detailed laboratory etudies are included in Tehle 1 There were no significant urnary abnormalities aside from traces of albumin during the

early febrile etage of the illness.

#### Comment

Intravenous pentothal anesthesia was effective in relieving the patient's discomfort during lumhar punctures although, even with its use, satisfactory immohitisation of the fractured femur could not be maintained. For this reason only six punctures were done over a ten-day period and probably three would have sufficed. The clinical behavior of the patient and the maintenance of a sufficient blood sulfonamide level served as adequate guides to therapy without more numerous spinal fluid examinations.

The change from sulfadiazine to culfapyridine was made because of the more detailed reports of the efficiency of the latter drug in the treatment of pnoumococcal meningitis. The sulfadiazine was used in the early and most critical period of the infection and had it been continued recovery would probably have resulted without the change to sulfapyridine.

#### Summary

 A case of post-traumatic pneumococcal (type III) meningitis with recovery is reported

2. Only 12 Gm of sulfadiazine and 74 Gm, of

sulfapyridino were used.

 Daily lumbar punctures were not done.
 The clinical behavior of the patient and the maintenance of adequate blood sulfonamide levels served as good guides to therapy

We are indebted to the Chief of the Surgical Service Lt. Col. Lee G. Acadall for permitting us to handle the medical side of this case, and to Capt. Robert M. McMillan for his notes and assistance

#### EXOGENOUS MENINGOCOCCIC CONJUNCTIVITIS

JACK R. KAHANER, CAPT, (MC), AUS, Mount Vernon, New York, and William W. LANOU, Maj, (MC), AUS, Pittsfield, Massachusetts

MANY cases of purulent conjunctivitis have been diagnosed and treated as genorrheal ophthalmia because of climical findings and the laboratory report of "gram-negative intracellular and extracellular diplococci" This case report is presented in order to stress the need for complete cultural and scrologic differentiation of the species of Neiszeria which may be responsible for a suppurative conjunctivitis.

#### Case Report

A 9-month-old baby girl was seen in the eye out patient department of Lawson General Hospital Georgia, about 10 00 P.M., May 16, 1944. The history obtained from the mother was that the history obtained from the mother was that the history obtained from the mother years that the stuck together. The child'e past history was completely negative. The futher gave a history of an old genorrheal condition which was completely cured to the best of his knowledge. Examination of the child revealed moderate swelling with slight crythems of the lids. A generous quantity of yellow purulent discharge was present along the lid margins. The conjunctiva was congested. The globe and cornea appeared nainvolved. The laboratory reported that a gram stain of the exudate revealed many gram negative intracellular and extracellular diplocece!

In view of the family history, clinical findings, and laboratory report, a tentative diagnosis of generical opbthalmia was made. The baby was placed under isolation precautions. Treatment was immediately instituted for genorrheal ophthalmia. A Bullar shield was applied to the left eye. Hourly irrusations with bone-acid solution were followed by instillations of 20 per cent argyrol. The surrounding ekin was covered with mertilolate ontment. On Gm. of sulfadiatine (14/s grains per pound of body weight for twenty four hours) was immediately given by mouth to be followed by 1/s Gm. plus 5 grains of sods bicarbonate every six hours. At the end of twenty four hours there was marked improvement. Subsequently, the laboratory reported the offending organism to be Neisseria intracellularia (Meningococcus) Type I The edema had largely disappeared so that the eye was partially opened. Discharge was limited to small amounts adherent to the globe or collected at the inner can thus. The hulbar conjunctiva was slightly chemotic and chowed a coarse congestion. The cornea remained clear

At the end of forty-eight hours the eye appeared normal, notwithstanding the fact that local therapy had been practically discontinued except for occasional borio-acid irrigations. The remaining hospitalisation was unoventful Sulfadianine was discontinued at the end of the fifth day and the patient was discharged to her home.

Nose and throat cultures were taken from the mother and father. The throat culture of the mother was essentially normal but the throat culture of the father revealed the same type of organism, N intra

cellulars, Type I After a course of sulfadiazine treatment subsequent throat cultures of the father were negative. He was considered to be the source of infection and was not allowed to come in contact with the baby during the period of positive throat cultures.

#### Discussion

Meningococcic conjunctivitis as a complication of cerebral meningitis has been described for many years but the incidence has markedly decreased with the advent of chemotherapy However, still more uncommon than endogenous meningococcie conjunctivitis is an exogenous meningococcic conjunctivitis with no general symptoms Reports of the latter are beginning to appear in the literature with greater frequency Thygeson1 reports a case of exogenous meningococcic conjunctivitis which re-Theodore and sponded readily to chemotherapy Notwithstanding Kost<sup>2</sup> added a few more cases their conclusion that it was possible to rule out gonorrhea clinically in some cases and make their diagnosis prior to culture, a diagnosis of conjunctivitis due to N intracellularis must be distinguished from other types of purulent conjunctivitis by bacteriologic methods which should include cultural, biochemical, and serologic procedures

Mangiaracine and Pollen's present other cases of meningococcic conjunctivitis and stress the point that the presence of gram-negative intracellular diplococci in a smear from an exudate of a patient with a suppurative conjunctivitis leads to a diagnosis of gonorrheal ophthalmia

#### Summary

A case of exogenous meningococcic ophthalmia is presented. The apparently increased incidence of this entity probably is due to more accurate diagnosis as a result of complete bacteriologic, biochemical, and serologic identification of the causative organisms. The obvious moral injustice done to the patient and family with a misdiagnosis of gonorrheal ophthalmia may be irreparable.

#### PRACTICAL NURSES GET PLACEMENT AID

Practical nurses should cooperate with the United States Employment Service in extension of its registry and placement of such nurses, the committee on recruitment and education of the agency recommended on April 10 Members of the committee reported that the USES placed an average of one hundred nurses a month, a majority of them practical nurses, in industries, institutions, and some private homes

"Chaotic conditions" in nurse placement in the State were reported by a subcommittee. The group said the nurse shortage on the home front and the public demand for a less expensive form of care than that of trained nurses had resulted in wider interest in practical nursing as a vocation as well as wide variations in fees, inadequate counseling, and lucrative and sometimes unscrupulous practices among commercial registries.

On the committee presenting the results of the study, made by Miss Mary C Jarrett, were representatives of the Practical Nurse Recruitment Committee, the New York State Nurses Association, and the New York City office of the USES The chairman was Mrs H Huntington Babcock

The report commented on the "present confusion and abuses" in placements, while recognizing the handicapsand pressures under which placement services were working and the exceptional demands made by households in which routines had been disrupted.

New York City offers an "exceptionally favorable opportunity" for a model demonstration of placement, the report declared, because of the variety of agencies interested in nursing, such as the Academy of Medicine, the Visiting Nurse Service, the Y W C A., the Department of Hospitals, and several voluntary hospitals. It recommended that counseling and placement be done by skilled personnel under general direction of a professional nurse familiar with the field

"Since the establishment of a special unit for placing practical nurses is under consideration by the USES," the report continued, "it would be wise to consider the possibility of a cooperative arrangement."

The employment service has made successful arrangements with cooperating groups in other fields

It would bring to the experiment an immense amount of tested experience and technics, by which the demonstration would be strengthened"

Planned guidance for applicants, the report said, would require that the placement secretary be "imbued with the mental hygiene point of view" Because nurses work largely with chronic and convalescent patients whose conditions include important mental factors, mental hygiene should be in the curriculum of approved nursing schools, according to the report —New York Times, April 11, 1945

## Postgraduate Medical Education

Programs arranged by the Council Committee on Public Health and Education of the Medical Society of the State of New York are published in this Section of the JOURNAL. The members of the committee are Oliver W H Mitchell, M.D., Charman (428 Greenwood Place, Syracuse), George Bach, M.D., and Charles D. Post, M.D.

#### Fall Lectures for Greene County

POSTGRADUATE Instruction for the staff of the Memorial Hospital of Greene County and the Greene County Medical Society will be given in the Full on Tuesday evenings at the Memorial Hospital of Greene County in Catskill.

The first lecture will be given on September 27 at 9 00 r M by Dr Ellery G Allen, associate professor of clinical medicine, and assistant professor of chincal pathology at the Syracuse University College of

Medicine His subject will be "Practical Considere tions of Blood Dysermans."

tions of Blood Dyscramas."

On October 25 at 9 00 r m. Dr Ivan Hekiman will speak on "Practical Application of Hormonal Therapy" Dr Hokimian is assistant professor of medicine and associate in thempeutica at the University of Buffalo, School of Medicine.

This instruction is arranged by the council com-

mittee on public health and education.

Dermatology

THE St Lawrence County Medical Society met on July 12 at 12 15 p.u in the Potsdam Club, Potsdam, to hear a lecture entitled 'Common Discoses of the Skin" illustrated with color photography and given by Dr Leon H Griggs, associate professor of clinical medicine (dermatology and syphilology) at Syracuse University College of Medicine.

This instruction was arranged by the Council Committee on Public Health and Education of the Medical Society of the State of New York.

#### CAFFEINE AND PEPTIC ULCER

There is no unanimity of opinion on the part of physicians as to the advisability of prohibiting coffee and caffeine-containing beverages for peptic ulcer patients.

Recent studies bowever, have brought out significant facts which indicate very definitely that caffeine is harmful for individuals who have or have

had peptic ulcers.

Judd injected guinea pigs and cats intramuscularly with caffeine contained in becawar and thereby produced gastric ulcers, although no stimulation of gastric section nor ulcer production was observed from caffeine injection or ingestion in dogs with Pavkor stomach pouches.

Paviov stomach pouches.

Roth and Ivy, by means of carefully controlled experiments have shown that caffelne given either orally or intravenously markedly atmulates gastric

secretion in man.

After a period of fasting the stomach was emptled and the secretion of matric julce determined overy ten minutes for a half hour. Them 200 cc. of water with 250 mg. of sodium benzoate and 250 mg. of sodium benzoate and 250 mg. of caffeine were introduced into the stomach, and after thirty minutes the stomach was emptied and the volume and acid concentration determined every ten minutes until the secretary response had subsided and the basal level once again was reached. Similar tests were made with sodium benzoate alone and an ordinary test meal but the response to caffeline was about two and a half that of these controls

1 Roth, J. A., and Ivy A. C.; Am. J. Physiol. 141:1454 (June) 1944. Roth, J. A., Ivy A. C., and Atkinson, A. J.; J. A. M. A. 130: 814 (Nov. 28) 1844. The significant finding was the difference in acid secretion response in different individuals. In about 85 per cent of those given 250 mg. (3<sup>1</sup>/<sub>4</sub> grains) of enficine (the equivalent of two cups of coffee) there was an abrupt rise in the total acid secretion lasting fifty to seventy minutes, 10 per cent showed a less amount of acid secreted with a return to the basal starting point in sixty to ninety minutes about 5 per cent showed a still more prolonged response at a high level. All but one of 36 peptiduleer patients showed a high and prolonged response.

Further tests with coffee itself and beverages containing caffeine in less amount showed that they too, stimulate gastrio secretion. The average response to tea, Postum and coffee with sugar and cream was about 60 per cent Sanka 75 per cent and Coca-Cola 89 per cent that of clear coffee. These drinks, though low in caffeine content, all contain elements other than caffeine content, all contain elements other than caffeine which stimulate stomach secretions.

Inamuch as the acidity of the stomach has much to do with preventing the healing of peptic ulcers and may even be an important causative factor, the conclusion seems warranted that those who have now ho have had peptic ulcers should not drink coffee, tes, or caffeine-containing drinks. It may be that those who know coffee does not "agree" with them are in the group of 5 per cent of individuals whose gastric secretion shows a high and prolonged response to caffeine It may not be assuming too much that in some of these individuals caffein may even contribute in the production of peptic ulcer—Minnesota Med. Jan. 1945

## Recent Amendments to Emergency Maternity and Infant Care Program

TWO recently adopted amendments to the Federal Emergency Maternity and Infant Care Program, New York State plan, dealing with infant care General practitioners can have been announced now be authorized to provide immunization service against diphtheria, smallpox, and whooping cough, "well-baby care," and office sick-infant care, on an annual basis Qualified pediatricians can also be authorized for these same services but at a higher remuneration Special provisions allow for increasing the basic fees if an unusual amount of care is

provided.

Under the terms of the two amendments, the mother will have free choice of utilizing the services of private physicians or of child-licalth conferences and the physicians will still be able to secure separate authorizations for the care of sick infants if treated in the home or hospital. Physicians can obtain complete details of the new procedures from their district health officer

## National Committee for Mental Hygiene Issues Its Thirty-Fifth Annual Report

THE urgent need for communities to provide clinics for psychiatric treatment and rehabilitation of returned veterans is stressed in the thirtyfifth annual report of the National Committee for

Mental Hygiene, distributed recently

Most of the resources of the Committee, used for activities connected with the war for the last few years, are now being directed toward veteran rehabilitation At the end of 1944 more than 1,500,000 men had been rejected for service, and 500,000 vetcrans had been discharged, for psychiatric reasons, revealing a staggering need for the creation of psychiatric facilities for the care of mentally disabled

The current annual report is the first issued during the administration of Eugene Meyer as president of the Committee Mr Meyer, editor and publisher of The Washington Post, and the first layman to head the Committee, succeeded Dr Adolf Meyer, professor emeritus of psychiatry at Johns Hopkins University, who was one of the twelve charter members of the Committee, served three terms as presi-

dent, and is now honorary president
"Mental hygiene is the greatest need of our warracked world," according to the report "The call is not always answered, but in our president (Mr Meyer) we see the type of human being and wise publicist who strengthens our hope for the world's

health "

The report also records the counsel and services of Dr George S Stevenson, medical director of the Committee, in connection with Selective Service and the rehabilitative service for veterans discharged

for neuropsychiatric causes

Through the assistance of the Commonwealth Fund, the Committee's Division on Rehabilitation, of which Dr Thomas A C Rennie is director, made a survey of the psychiatric resources of the country The survey "brought to light two startling facts there are twenty-five states without a single com-munity clinic. There are vast areas in other states where no psychiatric help is available

"Out of the total number of established hospitals and clinics in the entire country only one hundred and thirty-nine certified their preparedness to treat With the best will in the world mental casualties the Veterans Administration and the State Vocational Rehabilitation Bureau cannot provide psychiatric treatment when neither clinics nor psychia-trists are available The majority of mentally disabled men can, fortunately, be restored quite quickly to functional efficiency, provided treatment is readily available One simple rule permeates most psy-

chiatric treatment, the longer a man is sick the more difficult it is to cure him Obviously the shortage of

climes is wasteful, serious, and inhuman
"The number of Veterans Administration neuropsychiatric hospitals is at present limited to thirty. They offer hospitalization to all who need it but there is overcrowding. The most serious deficiency, however, occurs in connection with the outpatient Because many of these hospitals are located near large cities the outpatient treatment which they have to offer is impossible for men who live in the country, and for all those who require psychiatric treatment, but not hospitalization, the facilities are inadequate. This lack of outpatient care is very serious. Both in the interest of the veteran and in the interest of the citizenry at large, psy chiatric care should be available throughout the country, this would necessitate increasing the present number of psychiatrists by at least 10,000 together with the necessary auxiliary staffs"
"To encourage and stimulate the establishment

of the much-needed clinic, community organizations and personnel groups in the towns and cities of twenty-six states have been addressed by Dr. Luther Woodward, field consultant of the Division of chabilitation. The dearth of trained personnel Rehabilitation. handicaps the establishment of new clinics, but under the leadership of Dr Rennie an increasing number of communities are making special provisions for rehabilitation clinics by recruiting psychiatrists and social workers, wherever they can be found, and 'teaming' them for rehabilitation work one or two evenings a week."

The Committee has undertaken a special study of the factors involved in the development of a state plan for complete psychiatric rehabilitation. study is being made in Texas in cooperation with the

Hogg Foundation for Mental Hygiene

In an effort to enlighten the civilian population regarding the needs of returning veterans, the Committee has published two pamphlets designed to give concrete suggestions for members of the veteran's family When He Comes Back and If He Comes

Back Nervous, by Dr Rennie and Dr Woodward "Induction statistics," states the report, "indicate that in the early prime of life, one out of every six or seven men suffers from some form of neuropsychiatric disability of sufficient severity to exclude him from military service" To help meet this challenge, the Division of Child Guidance continues its work of recruiting and training new personnel Community child-guidance clinics have now been organized by the Committee into a formal association "to provide channels for sharing experiences and to take the responsibility for setting and main taining standards."

A section of the report dealing with mental hos-pitals in the United States states that "the mental hospital of today resembles too closely the asylum of yesterday." It warns that "the mental hospital of the future must be planned today" The report nlso describes research on dementia praccox and in the field of psychosomatic medicine.

Because of the strain on madequate facilities for returning veterans, the report says the Committee has redoubled the real with which it has been urging the establishment of a National Neuropsychiatric

Institute

## County News

#### Broome County

Maj Hyman Spcierson, Binghamton physician now serving with the 7th Field Hospital in Germany has been awarded the Bronze Star Medal.

The modal was awarded for "exemplary behavior In the line of duty and for excellence in skill and management."\*

Dr John D'Arecca of Bioghamton, a physician for the Voterans Administration has resigned.

In announcing his resignation, he said it was necessary "because of the increase in volume of work in private practice." The resignation became effective

The physician has been a Veterans Administra tion medical representative on a part-time basis since November, 1037, giving treatment to veterans who have service-connected disabilities.\*

#### Columbia County

Dr Henry Owen Lattle, who formerly spent part of his time in Hudson associated with his brother, Dr Robert H. Lattle, in the practice of eye, ear, and throat diseases, has now taken up permanent residence in Hudson.

After a period in general practice Dr Little studled ophthalmology in England, where he took courses for a year in the Royal London Eye Hospital (Moor field s) He then served as resident house surgeon in the Royal Westminister Eye Hospital London, for eighteen months He obtained the diploma of ophthalmic medicine and surgery granted by the Royal College of Physicians and Royal College of Surgeons.\*

#### Erle County

Dr Daniel V McClure who gave up his private mactice in 1908 to take a temporary job in the health department, retired on May 31 niter thirty-roven years of service to the city Dr McClure, one of Buffalo e outstanding practicing physicians at the turn of the century, has reached the compulsory retirement age of 70

#### Essex County

At the semiannual meeting of the Medical Society of the County of Essex there was a discussion on pre-paid medical insurance The society voted to join other counties in upper New York State in establishing a prepaid voluntary medical service plan.
Dr George Wright, of Trudeau Sanatorium, gave

Such an institution would be part of the United States Public Health Service and for the first time the Federal Government would give its support to the effort to control and prevent mental disorders train mental hygiene personnel, and establish community clinics

Plans for the Committee's 1945 annual meeting are contained in the report. A feature of the meeting will be the presentation of the Albert and Mary Losker Award, given annually through the National Committee for outstanding service in the field of mental hygiene The first award was made in 1944 to Col. William C Meninger for his contribution to the mental health of the men and women of the armed forces

a talk on silicous and its relationship to permanent disability

#### Fulton County

On June 6 at 6 30 r.m the Board of Directors of the Fulton County Tuberculosis and Health Associa tion and a few invited guests, attended a dinner at Hotel Johnstown, honoring Dr J Edward Grant, of Northvillo, who this year has completed a quarter of a century of service as president of the organiza

Great progress has been made in the control of tuberculosis and the methods utilized since the beginning of the movement and the work of the local association under the guiding hand of Dr Grant has kept pace with or in advance of the tuberculosis as-

sociations throughout the state and nation.

The Fulton County Tuberculosis Committee was The Fritton County Audercuces Committee was organized on Pebruary 0, 1919, the outgrowth of two committees functioning in Johnstown and Gloversville since 1911. The late Judge Fred Lanus Carroll was the first president and Dr Grant was vice-president. After holding office a year, Jindge Carroll reduced to the control of signed and Dr Grant has efficiently and devotedly served since 1920 \*

#### Herkimer County

The June meeting of the county society was held on June 12 at 4 P.M., at Pine Crost Sanatorium, Salisbury Dr Herbert Schwartz superintendent, presented a paper on "Newer Methods of Diagnosis and Treatments of Diseases of the Chest," Dinner was served at 6 00 P.M.\*

#### New York County

Dr Thomas H. Halsted gave the introductory ad dress to the summer session class of the School of Education, Now York University, on June 12 The lecture was entitled 'The Education and Adjustment of the Physically Handicapped Children, with special reference to the anatomy physiology and pathology of the ear, and particular emphasis on the means of belping these children. Dr Halsted pointed out the need for the early recognition of the cause of deafness, and for the removal of the causes by the otologist, the wearing of properly fitted hearing alds, and the study of lip reading
At the conclusion of the lecture, Dr Halsted gave

a description of the fenestration operation, with the pros and cons as to the final results of this operation an operation which is having a wide discussion among the victims of otosclerosis, as well as among

<sup>\*</sup> Asteriak indicates that item comes from a local news-

the ear specialists throughout the country and students of sociology

Col Udo J Wile, medical director, US Public Health Service, gave a lecture on July 6 at Mount His subject was "Experience in Sinai Hospital 8,500 Cases of Early and Late Syphilis with Penicillin Alone and in Combination with Arsenic, Bismuth, and Fever "

A doctors' tribute was paid to a great physician and bibliophile in the presentation to Dr Eli Moschcowitz, consulting physician of the Mount Sinai Hospital, of an anniversary volume of scientifications. tifie papers by his colleagues, on June 27 in the The vol-Blumenthal Auditorium of the Hospital ume, a special edition of the Journal of The Mount Since Hospital, was presented in commemoration of Dr Moschcowitz' recent sixty-fifth birthday

The volume was presented by Dr B S Oppenheimer, a former teacher of Dr Moschcowitz and fellow consulting physician to the Hospital contains over 800 pages, representing original articles by seventy-six of Dr Moschcowitz' professional associates, many of whom began their medical careers under his tutelage Speakers at the presentation ceremony, in addition to Dr Oppenheimer, were Dr Solon S Bernstein, Dr Robert T Frank, and George B Bernheim, president of the Hospital

This honor has come to Dr Moschcowitz by virtue of twenty-five years of service as physician and teacher at the Mount Sman Hospital He entered the Hospital as intern, following his graduation from the College of Physicians and Surgeons of Columbia University in 1900 After postgraduate work in Berhn and Vienna, he was appointed pathologist at the Beth Israel Hospital, New York City In 1920, he joined the staff of the medical service of the Mount Sinai Hospital and from that time date his important contributions to clinical medicine

#### Oneida County

Maj Gen. Norman T Kirk, surgeon general of the Army, addressed the medical staffs of Rhoads General Hospital on June 5

General Kirk, making his first visit to Rhoads. said that the Army casualty load is increasing and that the medical department's job will continue "long after the victory over Japan"

In making his inspection of the hospital he spent much of his time talking to patients and discussing their treatment and progress with ward surgeons

High praise for the part that surgery has played in saving the lives of soldiers was expressed by General Kirk. He told what vast studes had been made in perfecting surgical technics in the period between World War I and the present conflict and declared that equally surprising advances have, been made since he first witnessed operations in Africa in April, The general, who has visited most of the ma-1943 jor front lines, told of some of the outstanding work he had seen.

Some 65 per cent of the battle casualties in the European theater were returned to duty in chest cases, he said, has been reduced to one-third of what it was in World War I and, instead of losing 70 per cent of abdominal cases, as in the last war,

the medical department in this war has lost only 20 per cent

## Ontario County

The third quarterly meeting of the Ontano County Medical Society was held at Clifton Springs Sanitarium and Clinic on July 10 The program consantarium and Clime on 1913 to The program consisted of a business meeting at 5 00 p m, dinner at 6 30 p m, and the scientific session at 7 30 p m, at which Dr Milton Bohrod, director of laboratories and pathologist of the Rochester General Hospital, presented an illustrated talk on "Blood Dyscrasias"

#### Orange County

Gold diplomas, commemorating fifty years in the medical profession, were presented to Dr Oscar Northway Meyer and Dr Edwin M Schultz, of Middletown, on June 13 by New York Medical College, Flower and Fifth Avenue Hospitals at the eightysixth annual commencement exercises in New York City Dr Frank Kingdon was the principal speaker

Twelve other surviving members of the Class of 1895 were similarly honored at the exercises, which took place at the New York Academy of Medicine. They represented a total of seven hundred years of

medical practice

## Schenectady County

Dr B L Vosburgh has been appointed a member of the general staff of the General Electric Company apparatus manufacturing division to study the medical work and health problems at each of the apparatus works of the company, Neil Curric, Jr, manager of manufacturing, has announced

Dr Vosburgh will act as consultant in coordinating the work of all apparatus divisions and will con-

tinue as Schenectady works' physician

As a result of an auction at the semiannual meeting of the Schenectady County Medical Somety, held in the Mohawk Golf Club on May 31, \$20,000 worth of war bonds were purchased This brings the society's total during the seventh war loan campaign to \$60,000

The auction was in charge of Dr D Glen Smith, president, and Dr Ralph E Isabella, and the articles disposed of were donated by drug concerns \*

#### Troga County

Dr Louis Kress, chairman of the New York State Society for Cancer Control, spoke at a meeting of the county society in the Tioga County General Hospital on June 12

#### Washington County

Dr Samuel Pashley, one of Hudson Falls' bestknown and oldest physicians, was honored on June 9 at Warner's Lake when he and ten other physicians observed the fiftieth anniversary of their graduation from the Albany Medical College

Dr Pashley was graduated from the college in 1895 and has practiced in Hartford and this village The party took place at the cottage of Dr Frank

Hurst, a member of the 1895 class

In the evening Dr Pashley attended the annual alumni banquet of the college in Albany and with the ten other members who had practiced for fifty years was presented a certificate by the president of the college \*

## Necrology

Joseph F Battaglia, M D, school physician for the City Health Department of Buffalo, died suddenly on June 3 He was 49 years old Dr Battaglia was graduated from the University of Buffalo in 1920 and was appointed to the City Health Department twelve years ago as a school doctor He was a member of the Ene County Medical Society, Baccill Medical Society, the Medical Society of the State of New York, and the American Medical Association

Edward T Curran, M D of Brooklyn, died on March 28 at the ago of 09 A native of Ireland, he received his medical degree from the Long Island College of Mediceno in 1905 and became a medicocal specialist He also served as a State lunacy commissioner A veteran of the Spanish-American War and the Boxer and Philippine rebellions, Dr Curran compiled a handbook on the Philippine language, Tagalog, for American troops

Homan V Doggan, M D, of Brooklyn died on April 29 Dr Duggan received his medical degree from the Long Island College of Medicine in 1893

Samuel Jesse Goldfarh, M D of Now York City, deed on June 27 A specialist in gastroenterology, Dr Goldfarh had served as associate radiologist at the Mt. Sunai Hospital for the last twenty years. He had also conducted postgraduate courses in his specialty at Columbia University during the past ten years. He was graduated from the College of Physicians and Surgeons, Columbia University, in 1905 and was a member of the medical societies of New York County and State, and of the American Medical Association

Joseph Leo, M.D., of New York City, died on June 28 in his office. He was 65 years old Dr Leo received his medical degree from New York University Medical School in 1910, and had practiced in New York City for thirty five years

Issac Levin, M.D., of New York City, died on Jin the treatment of cancer, having been director of the New York Cancer Institute from 1923 to 1930 and associate professor in pathology and cancer research at Columbis University for seven years, and at New York University for fifteen years. From 1912 he was chief of the cancer division of Montefore Hospital and chief of the radiology department of Lebanon Hospital A native of Russia, Dr Levin was graduated from the Petrograd Medical Academy in 1890 He was a diplomate of the American Board of Radiology, a fellow of the New York Candemy of Medicine, and a member of the New York County and State medical societies and the American Medical Association

Frank R. Lock, M D, of Buffalo, died on April 28 at the age of 75 Dr. Lock received his medical degree from the University of Buffalo School of Medicine in 1897

Herbert Wood Matthews, M.D., of Penn landied on June 5 after a long illness He was 73 years

nld. He received his medical degree from Starling Medical College, Ohio, in 1896 and practiced in North Dakota for eight years before going to Penn Yan He was a member of the Yates County Medical Society, the State medical society, and the American Medical Association

Henry E Merriam, M D, of Ithaca, died on June 25 in Clifton Springs Sanatorium after a long lilness Graduated from the New York Homeopathie Medical College in New York City, in 1891, Dr. Merriam practiced in Owego before going to Itlaca about thirty-five years ago. Ho was formerly consultant un the staff of the Tioga County General Hospital and consultant physician at Memorial Hospital Howas 70 years old.

Charles J Oppenheim, M.D., specialist in cardiology, died on Juno 26 at his homo in Queens. Howas 50 years old. A member of the staff of the Beckman and Lenox Hill licspitals, Dr Opponheim received his medical degree from Cornell Medical College in 1928. Ho was a member of the Queens County Medical Society, the State medical society, and the American Medical Association

Robert H Tedford, M.D., practicing physician in Albany for forty-five years, died on June 27 nt the ago of 82. He was graduated from Albany Medical College in 1893, and was a member of the Albany County and State medical societies, and the American Medical Association

Charles Edward Terry, M D of Wingdale, died on February 18 at the age of 67 He received his medical degree from the University of Maryland in 1903, and before his retroment was a member of the Medical Society of the State of New York, the American Public Health Association's Society of Tropical Medicine, and the Southern Medical Association

Elizabeth Wiltshire Wright, M D, of Mount Vernon, and formerly of New York City, died after a short libees on July 4 at the age of 69 A graduate of Laura Memorial Medical School in Cincinnati, Ohlo, in 1903, and of Boston University School of Medicine in 1909, she had speculized in electrical therapy and gynecology Whito in New York she had been on the staffs of St Luke's Hospital and Metropolitan Hospital She was a member of the New York State and County medical societies, the American Medical Association and the American Congress of Physical Therapy

George L. Wurtzel, M.D., professor of traumatic surgery at Post Graduate Hospital in New York City, died on June 28 at the age of 55. He was graduated from the College of Physicians and Surgeons in Baltimore in 1912 and at his death was on the staffs of Reconstruction and Park East hospitals in New York City. Ho was a member of the New York County and State medical societies and the American Medical Association

## Hospital Activities of the Veterans Administration

N ONE year's operation since passage of the G I Bill of Rights, the Veterans Administration has added 5,278 new hospital beds, and has 13,525 beds under construction, 16,442 authorized for construction, and 26,772 recommended to the Federal Board of Hospitalization, Brig Gen Frank T Hines, Administrator of Veterans' Affairs, announced on

In summing up the activities of the Veterans Administration since Public Law 346, approved June 22, 1944, provided a high priority for personnel and material, General Hines pointed out that one of the major problems-personnel-is being partially over-

come

When the G I Bill was passed, he pointed

out, there were approximately 47,000 employes on the payroll In the past year the roll has grown to 55,000, with a total of 69,000 jobs authorized. A nation-wide recruitment program gained 8,349 em-

In addition to the hospital expansion, various changes in the hospital system, including establishment of a mental-hygiene clinic in Los Angeles, and specialized centers in chest surgery, amputation, cancer, and spinal-cord injuries have been affected

In broadening the hospital services to veterans, outpatient treatment has been expanded particularly for service-connected neuropsychiatric patients, though this expansion has been curtailed by the shortage of psychiatrists

## Nine Cancer Grants-in-Aid Approved by Cancer Advisory Council

NINE grants-in-aid totaling \$79,377 were approved at the twenty-eighth meeting of the National Advisory Cancer Council, held in June at the National Cancer Institute of the Public Health Service of the Federal Security Agency, Bethesda, Maryland, the Agency announced on June 23 These funds, the greatest amount ever granted at one time by the council, reflect the growing interest in the disease by medical groups throughout the country that are joining hands in cancer research and education. At the present time cancer is the second cause of death in the nation

The largest individual grant, \$24,500, was made to Harvard University, Boston, for the study of the relation of steroid hormones to growth and tumors Dr J H Means will be in charge of this work. Drs Fuller Albright and Joseph C Aub will also participate in these studies Mt Sinai Hospital, New York City, was next on the list of approved grantees, with \$10,775 for chincal studies on gastric cancer This work will be under the direction of Dr Franklın Hollander Harvard University was given an additional grant of \$10,000 for study of the pathology of cancer of the stomach, peptic ulcer, and gastritis, with Dr Shields Warren in charge Another grant was voted, for clinical studies of gastric cancer, to be conducted by Dr Leon Schiff, of the University of Cincinnati, Cincinnati, Ohio The school was of Cincinnati, Cincinnati, Ohio granted \$10,000 for this purpose

Approval was also given to a request from Northwestern University, Chicago, Illinois, for \$8,500 for research in cancer education Dr A C Ivy, member of the council, will supervise the work. Dr Paul A Zahl will direct research on the virus-like agent in mammary cancer of mice for which the Haskins Laboratories, New York City, was granted \$5,000 The relation of certain types of diets to induced cancer in rats is the research planned by the Detroit Institute of Cancer Research, Detroit, Michigan, A grant of \$6,152 was recommended for the study Dr W F Dunning will be in charge New York University, New York City, was granted \$3,000, which will be used by Dr Robert W Chambers in a study of Hodgkin's disease A grant of \$1,450 was made to the University of Minnesota, Minneapolis, where studies on leukemia in mice will be conducted by Dr. Arthur Kuschbaum

Members of the Council are Dr George M Smith, executive director of the council and professor of anatomy of Yale University, New Haven, Connecticut, Dr Frank E Adair, president of the American Cancer Society, Inc., and a staff member of Memorial Hospital for the Treatment of Cancer and Allied Diseases, New York City, Dr. A. C. Ivy, professor of physiology at Northwestern University Medical School, Dr James B Murphy, Rockefeller Institute for Medical Research, New York City, Dr A. Baird Hastings, Harvard University Medical School, and Dr Sherwood Moore, director of the Mallinckrodt Institute of Radiology, St Louis, Missouri Surg Gen Thomas Parran is chairman, er officio, of the council

The Public Health Service was represented by Dr R E Dyer, director of the National Institute of Health, Dr R. R. Spencer, director of the National Cancer Institute, and Dr Ralph Braund, director of the Tumor Clinic, US Marine Hospital, Balti-

more, Maryland

## Improvements

The memorial fund committee of the Five Towns branch, American Red Cross, has completed a special duty with the opening of three hospital rooms, furnished from funds donated in memory of Edith R Barnett and Felix U Levy

I'wo rooms, hurrack rooms 302 and 306 at Mitchel Field Hospital, have been furnished with attractive

furnishings purchased with the money remaining

in the Barnett memorial fund. A third large room at Mason General Hospital, Brentwood, has been similarly furnished in memory of Mr Levy Plaques will be put up in both rooms

The fund committee, which includes F Abbott Goodhue, chairman, Judge Clarence G Galston, Dr Nathaniel Barnett, Sigourney B Olney, Mrs. Leonard Sullivan, Mrs. Karl W Rosenberg, and Mrs. William H E Jay, Jr, will continue to func-

<sup>\*</sup> Asterisk Indicates that item is from a local newspaper

The inhalation from tubes of volatilizable vasoconstricting drugs is often very effective. The most popular and best known of this sort is the benzedrine (amphetamine) inhaler.

Feinberg, S.M.: Allergy in Practice, The Year Book Publishers, Inc., Chicago, 1944, "Hay Fever Treatment."

## A BETTER MEANS OF NASAL MEDICATION

Between office treatments, the use of BENZEDRINE INHALER, N.N.R., will afford the allergic rhinris patient marked symptomatic relief. It may, in fact, make all the difference between weeks of acute misery and weeks of comparative comfort.

The Inhaler produces a shrinkage of the nasal mucosa equal to, or greater than, that produced by ephedrine—and approximately 17% more lasting It is, consequently, strikingly effective in reducing the congestion of hay fever, head colds, and sinunds. Smith, Kline & French Laboratories, Philadelphia, Pa.

BENZEDRINE

Each Benzedrine Inhaler is packed with racemic amphetamine, S.K.F., 200 mg.; menthol, 10 mg; and aromatics.

[Continued from page 1694] tion as part of the local branch Its duty is to deter-

mine the specific usage of monies donated to the Red Cross for any special memorial fund \*

## At the Helm

Dr Robert H Gelder, of Winthrop, a member of the surgical staff of Potsdam General Hospital for twelve years, left in July to join the surgical staff of Chenango Memorial Hospital in Norwich

Dr Gelder was for six years a St Lawrence County coroner He is past president of the Pots-dam Hospital surgical staff \*

Two physicians of the staff of St Francis' Hospital, Poughkeepsie, were among four new directors who were appointed to the advisory board of the hospital at the annual meeting of the board on May 31 They were Dr James J Toomey, chief of staff, and Dr James E McCambridge Mayor Doran and City Judge Corbally were the other two directors who were appointed to new terms on the board, both having served previously some years ago the first time in the history of the institution that members of the medical and surgical staff were appointed to the board \*

Dr Charles S Peckham, obstetrician-in-chief of Bassett Hospital and retiring president of Otsego County Medical Society, has resigned his hospital

post

He will become head of the department of obstetnes and gynccology at Manchester Memorial Hospital, Manchester, Connecticut Dr Peckham went to Cooperstown from Johns Hopkins University, Dr Peckham went where he was an associate professor

County Executive J Russell Sprague has accepted the position of honorary chairman for the Long Beach Memorial Hospital campaign to raise \$250,000 for expansion of facilities, it was announced

by Dr George S Reiss, president, on June 15 William F Ploch, president of the National City Bank of Long Beach, is treasurer, it was revealed by J W Brantman, executive chairman Other officers include City Judge Charles Zimmerman, chairman of the speakers' bureau, and Milton E Nemerow, chairman of accounting

Brantman will direct the special gifts appeal with Bernard Sharp, Sol Wolff, and Herman Wood as James Gerson is chairman of associate chairman

the general canvass, which starts August 1.

Dr Earl W Mungle, of Binghamton, now heads the Broome County Tuberculosis Hospital board of directors at Chenango Bridge, following the annual meeting of the board at that institution on June 5

Dr Mungle succeeds to the office formerly held for three terms of five years each by Rana S Cooper, of

Binghamton, who declined reappointment Bernard H Chernin, Binghamton attorney, was re-elected vice-president Owing to his position as acting superintendent, Dr Howard Davis automatically takes over the offices of secretary and Owing to his position as treasurer, in place of Dr Edward Roach, former superintendent, who has left for a similar position upstate '

Peter Paul Miller, of Schenectady, has been named a member of the board of managers of Ellis Hospital, Chester H Lang, president of the hospital board, announced on June 7

Mr Miller's appointment was made by the board of managers at a recent meeting He will complete the term of the late Joseph H Clements, Jr, which expires in June, 1947 \*

The first Negro to receive a staff appointment with a city-operated hospital in Bronx County is Dr George D Thorne, of New York City, appointed on June 7 to the surgical staff of Lincoln Hospital

To accept the appointment, Dr Thorne had to resign as assistant visiting surgeon at Harlem Hos-At Lincoln pital, a post he has held for five years Hospital he will rank as clinical assistant visiting surgeon, according to Edward M Bernecker, Commissioner of Hospitals

Dr Thorne described his appointment as a step forward for Negro doctors, "but one that leaves us

a long way to go "

The doctor said that there are two hundred Negro doctors in Manhattan, and another one hundred in Brooklyn, Queens, and the Bronx, with less than twenty holding staff positions with city

Appointment of Negro doctors to the Lincoln Hospital staff has been anticipated With the spread of Harlem's population to the East Bronx, Negro patients account for 50 per cent of the hos-

pital's total \*

## Newsy Notes

A new school for the training of physical therapists will be opened by Albany Hospital in Septem-The course will be given twice yearly, the first class will be admitted on September 12, and the second on March 13, 1946 Albany Hospital, a 571-bed general hospital, including a psychiatric payihon and a tuberculosis sanitorium, is affiliated with Albany Medical Col e The period of study is nine months, with a preclinical course of three months and a clinical course of six months Candidates for admission should be able to satisfy one of the following requirements (a) graduation from an accredited school of nursing, (b) graduation from an accredited school of physical education, or (c) two

3 ears of approved college training, including satisfactory courses in biology and other sciences The tuition for the course is two hundred dollars who desire an application blank or other information should address an inquiry to the Director, Department of Physical Therapy, Albany Hospital, Albany 1, New York

Free plasma and free transfusions for all patients of Memorial Hospital, Albany, were discussed at a meeting in the Court House on June 5 when representatives of various civic and fraternal organiza-

## SUPER-SEAL VITAMINS

Super Seal Vitamins are not ordinary pellets, but a definite advance in tablet engineering. The construction is unique with respect to the architectural segregation of the water soluble from the fat soluble vitanins. An inner, enteric type sugar coating makes each vitamin available in its respective medium, i.e., the fat solubles in the alkaline medium of the intestines and the water solubles in the acid medium of the stomach

## SUPER-SEAL "C"

(WITH A AND B1)

The employment of vitamin C in allergies is recommended by various investigators, though scientific opinion differs regarding its definite effects

In the efficient management of Hay Fever, Rose Fever, Eczema, Contact Dermatitis, a co-existing condition may call for therapeutic doses of vitamin C

"Super-Seal "C" with A and B<sub>1</sub>" provides vitamin C in high potency — assuring adequate strength for clinical control of conditions arising from a deficiency of this vitamin Each peliet, contains 125 mgm vitamin C; 1 5 mgm vitamin B<sub>1</sub>, 2500 USP units vitamin A

Suggested Dosage — initially, 4 to 8 peliets per day, gradually reduced after ten days to a maintenance dose of 2 per day in botties of 40's and 100's at prescription pharmacies

Other Super-Seal Vitamins: Super-Seal "VITALERT" and Super-Seal VITAMIN D

tions assembled to discuss a volunteer program origi-

nating with the hospital's board of trustees

The life-saving plan to create an adequate blood bank and volunteers for direct transfusions is so designed that no organization participating will be under any strain whatsoever to meet its quota, according to Roland G Fowler, works manager and vice-president of the Allen-Walex Adding Machine Corporation, and a hospital trustec \*

A \$250,000 expansion project for Long Beach Hospital to include a new maternity wing and a nurses' home, was announced on June 7 by the board of directors through Dr George S Reiss,

The new buildings are planned as a living memorial to the Long Beach men who have given their lives for their country in World War II The addilives for their country in World War II

tional facilities will increase the bed capacity of the hospital by 60 per cent

Originally planned by the board of directors and Hospital Club as a hospital program, the project has been thrown open to the entire city as a com-Veterans' organizations and munity endeavor members of the clergy have taken the lead in hailing the project as the most worthy plan for the betterment of the city \*

Additional memorial subscriptions totaling \$14,-900 to the \$300,000 Ossming Hospital building fund were announced on June 2 by Walter L Johnson, president of the hospital and chairman of the memorial gifts and corporation subscriptions committee

A subscription of \$6,500 from Eastern Aircraft Division of General Motors will assure hospital protection for all Eastern Aircraft employees and their families living in the communities served by Os-

sınıng Hospital

The Foreign Mission Sisters of St Dominic at Maryknoll subscribed \$4,500, of which \$4,200 will meet the estimated cost of building and furnishing a private room on the second floor of the new wing, and the remainder will be used for the general con-

struction of the new wing
A children's ward for \$2,100 has been memorialized by Briarchiff Junior College The C J Drislane Company, Inc., has also memorialized a children's ward for \$1,800 These wards will both be part of the new pediatric department to be included on the reconstructed first floor of the original hospital

building \*

Dr Edward M Bernecker, Commissioner of Hospitals, received a check in his office for \$892 today "for the general welfare and recreation" of the members of Army General Hospital 37, serving in northern Italy and comprising personnel of Kings County Hospital, Brooklyn

The check was given the commissioner by Dr Joseph Tenopyr, president of the Hospital Medical Board and president of the Kings County Medical Society The money was given as a personal gift Society The money was given as a personal gilt to Dr Tenopyr at a recent testimonial dinner by the medical staffs of Kings County and Caledonia

Bernecker thanked Dr Tenopyr and said that he appreciated the doctor's decision to forego using the funds personally in order to give it to the unit, which comprises one hundred and fifty doctors, nurses, and auxiliary personnel.

The commissioner gave the check to Dr Charles Mueller, treasurer of Kings County Hospital's medical board, who said that he would send it at once to

The medical staff of Huntington Hospital was host for the one hundred and thirty-ninth regular meeting of the Associated Physicians of Long Island on June 12, at which time the members gathered at the Crescent Club A scientific session was held at 3 00 pm, with a symposium on lymphoid diseases, followed by a business meeting at 5 00 PM and dinner at the club at 6 00 PM.

Dr John L Sengstack, president of the medical staff of the Huntington Hospital, is also president of the Associated Physicians of Long Island He presided at the meeting and at the dinner and introduced Alfred Marchev, president of the Republic Aviation Corporation, who addressed the society on his recent trip to the Southwest Pacific \*

Members of the staff of the Saratoga Hospital were specially honored during the year 1944, according to the annual report of the sccretary of the staff

Dr Walter S McClcllan was made president of the American Society for Physiological Medicine, Dr J E MacElroy became president of the Public Health Association of the state, Dr G Scott Towne was made a delegate to the American Medical Association from New York, and Dr Fred J Pratt was awarded the diploma of the Board of Otolaryngology \*

Medical officers returning from war service will have an opportunity for postgraduate medical edu-cation in Buffalo, Dr Earl D Osborne, chairman of Buffalo General Hospital's Education Committee, said on June 14 in connection with the hospital's A plan has been outlined to expansion program make available a large number of residencies in Meyer Memorial Hospital, Children's Hospital, and Buffalo General Hospital in cooperation with the University of Buffalo School of Medicine

This program locally will meet the need for double the prewar number of hospital residencies estimated as necessary by members of the Council on Medical Education and Hospitals of the American Medical Association upon the basis of a questionnaire survey of more than 20,000 medical officers now in the

armed forces.

Eighty per cent of both recent medical graduates and experienced older doctors in the group indicated

they desire additional training

Buffalo General Hospital has developed an inclusive educational program for the training of students of the University of Buffalo School of Medicine as well as hospital interns, residents, nurses, and laboratory technicians Another important part of this program is the continuous postgraduate selfeducation carried on by staff members '

A new building capable of housing 400 patients will be built at Castle Point, in Dutchess County, in connection with the greatest hospital construc-tion program ever undertaken by the Veterans' Administration, according to Col Carleton Bates,

manager of the Veterans' Hospital The Veterans Administration in Washington is soliciting bids for sounding of the foundation. These bids, as well as bids for construction of the buildings, are handled by the Washington agency and do not go through the Castle Point Hospital, Colonel Bates explained Cost had not yet been estimated for the new sixstory building, which will house the hospitals' administrative offices and all clinics, as well as an operating suite on the top floor The bed facilities will be for tuberculosis patients only \*

A gift of \$81,000 to the Buffalo General Hospital Building Fund, made by Buffalo Forge Co, Mr and Mrs Edgar F Wendt, and Mr and Mrs Henry W Wendt, will establish a memorial to Henry W Wendt, Sr, one of the founders of the company, it was announced on June 15 by Carlton P Cooke, chairman of the \$4,000,000 campaign.

The new subscriptions will establish a large section of the south wing on the second floor of the enlarged hospital building This section contains a tenbed ward, two four-bed wards, two semiprivate rooms, a nurses' station, diet kitchen, and service facilities Mr Cooke stated that this ward department is one of the most important units in the hospital It will care for patients in the middle income brackets as well as teaching cases

The contribution also will create the two chemistry research laboratories on the second floor of the east building of the expanded hospital These laboratories will make possible continued research into the causes of disease, development of serums and drugs to combat them, and investigation of data and results \*

Necessary priorities for a seven-story addition to New Rochelle Hospital were received on June 2 from the War Production Board, according to announcement from William W Sheppard, acting superintendent of the hospital

The priorities, signed by J Joseph Whelan, recording secretary for W P B, cover the necessary steel, copper, flashing, plywood, and lumber for the building

It is expected work will begin on the project as soon as materials can be delivered \*

The first \$10,000 memorial has been reserved in the new Monticello Memorial Hospital for Messrs Joseph Posner and Joseph Brickman and family, owners of the Brickman Hotel Mr Posner announced the gift of \$5,000 in addition to the proceeds derived from the dinner given at the Brickman Hotel on June 3 The proceeds from this dinner were donated by Messrs Posner and Brickman to the hospital \*

The W K Kellogg Foundation, Battle Creek, Michigan, has given Columbia University a grant of \$60,000 to establish a course of training for hospital administrators, the New York Times reported on June 5 The work will be carried out in the De-Lamar Institute of Public Health and will be available for graduate students The Times stated that plans already had been made for the Columbia faculty of medicine to carry out the training program in cooperation with hospitals and other organizations throughout the country

Herman F Zorn, chairman of the building committee, announced at a meeting on June 5 of the Columbia Memorial Hospital Building Fund committee, that \$400,000 has already been realized through cash contributions and pledges. Of this total \$201,250 was contributed by members of the Board of Trustees and the medical staff of the Hudson City Hospital

Raymond P Sloan, editor of Modern Hospital, gave an address on "Our Hospital" and the great need of a modern hospital in the community \*

## SPEECH DEFECTS INCREASE, ASCRIBED TO WAR STRAIN

A war-caused increase in the number of persons who stutter or suffer from other speech defects appears in the records of the National Hospital for Speech Disorders, according to the annual report by its medical director, Dr James Sonnett Greene

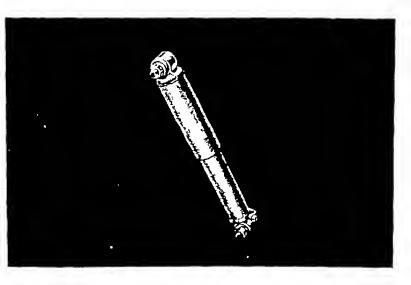

A total of 3,749 patients, the largest since the start of the hospital twenty-nine years ago, and 800 more than the previous year, were treated during the past year, Dr Greene reports

The added emotional strains and conflicts brought on by wartime conditions explain the increase, in

Dr Greene's opinion Many of the patients were servicemen and exservicemen with speech disorders that developed under the strain of military service

or had been aggravated by it

A large proportion of these men were treated without charge The Government is now arranging, Dr Greene reports, a contract with the hospital under which it will assume the financial responsibility of rehabilitating veterans referred to the institution for treatment -Science News Letter, April 7, 1945

# How many of these do you own?

If you look under your car, you'll probably find a couple of gadgets something like this one

They're shock absorbers.

They take the sting out of sudden bumps and jolts. They make a rough road smoother

And If you're wise, somewhere in your desk, or bureau drawer, or safe deposit box, you have a lot more shock absorbers. Paper ones, War Bonds.

If, in the days to come, bad luck strikes at you through illness, accident, or loss of job, your War Bonds can soften the blow

If there are some financial rough spots in the road ahead, your War Bonds can help smooth them out for you

Buy all the War Bonds you can. Hang on to them Because it's such good sense, and because there's a bitter, bloody, deadly war still on.

# BUY ALL THE BONDS YOU GAN....

### "DOCTOR JONES" SAYS-

"Sinus trouble" that's something that more people in this climate have and less understand than most anything I can think of-unless it is ration schedules The one thing that seems to be quite generally understood and accepted is that having persistent sinus trouble is ground for spending your

winters in a warmer climate if you can afford it
That word "sinus"—it don't always mean the
same thing What we're talking about here the nasal accessory sinuses—they're cavern-like affairs located in the bones around the nose and having openings into the nose. They're lined with mucous membrane that's continuous with that of the nasal The frontal sinuses are located in the bone over the eyes, the maxillary in the upper jaw, between the roof of the mouth and floor of the nose-

and so on.

The function of these sinuses—it seems it ain't just to contribute to the support of the nose special-They're supposed to help in warming up and moistening the air we breathe and they tell me it's quite desirable, from a health standpoint, to have 'em working right. Way back in the early history of the development of man, it appears it was these sinuses they did their smelling with very largely

But the smelling job was turned over to another de-

partment

What started me off on this—I was reading an ticle on the treatment of sinus troubles. The article on the treatment of sinus troubles more they know about the actual conditions in these sinuses, when they're getting symptoms from 'em, the less inclined they are (the specialists, that is) to jump in and give active treatment—surgical and so

on—in the average case

The "bulgy" headache that's characteristic of sinus trouble—only in a very small percentage of cases, this article says, does it mean chronic infec-tion of the sinus, with pus and all that It may come—and I gather it does in the majority of cases just from congestion in the mucous membranes what the author called "allergic congestion" And, a good many cases, the symptoms (stuffiness, occasional headache, and so on) the patient magnifies 'em out of all proportion to their importance sort of a psychoneurosis So, while an occasional case may require drastic treatment, the majority of 'em-I gather the best treatment, if they can't go South, is to help 'em forget they've got sinuses—Paul B Brooks, MD, in Health News, March 19, 1945

### To the Medical Society of the State of New York

### Executive Board Meeting

ON MONDAY, June 25, Mrs Edwin A Griffin, of Brooklyn, who is president of the Woman's Auxiliary to the Medical Society of the State of New York, entertained the Executive Board at a luncheon meeting Plans were made for important health projects for 1945–1946 Among those who attended were Miss Yolande Lyon of the Public Relations Bureau, Medical Society of the State of New York, Mrs Albert M Bell, Sea Cliff, Mrs William Car-

hart, East Islip, Mrs Meyeron Coe, Queens, Mrs Thomas D'Angelo, Queens, Mrs Luther H Kice, Garden City, Mrs William LaVelle, Long Island City, Mrs Michael M Schultz, Hollis, Mrs Byron St John, Port Washington, Mrs Louis A Van Kleeck, Manhasset, Mrs H F Pohlmann, Middletown, and Mrs Henry J Jauch, Mrs Walter J Puderbach, and Mrs George H Smith, of Brooklyn

### County News

Nassau County The Woman's Auxiliary to the Nassau County Medical Society will open the Fall season with a membership tea in September The tentative place of the meeting is the Nassau Hospital auditorium in Mineola

Mrs Louis A Van Kleeck, president, was hostess to members of the executive board at a luncheon meeting held at the North Hempstead Country Club in June Those board members present were the Mesdames Arthur C Martin, Byron D St John, Arthur D Jaques, Albert M Bell, Clymer A Long, John L Neubert, William P Bartels, Thomas J Evers, Louis B Chmislewski, Dwight P Bonham, M G Moghtader, Ralph M Perry, Nathaniel H Robin, George E Christmann, H S McCartney, August Fincke, Spencer B Caldwell, and Wilber G Holz

### RECENT PROGRESS IN CANCER CONTROL

There are definite indications from a number of sources that the mortality from cancer is beginning to come under control During the past decade noticeable progress has been made, particularly among women, in the attack on this major public health problem For example, among white females insured in the Metropolitan Life Insurance Commence Institute Decade and Commence Insurance and Insurance Commence Institute Decade and Insurance and Company's Industrial Department, essentially an urban group, the standardized death rate from cancer at ages 1 to 74 declined steadily from 90 4 per 100,000 in 1934 to 80 3 in 1944, a decrease of 11 per Nor are the signs of progress limited to the past decade For almost a quarter century prior to 1934 the cancer mortality among these white women at every age period below 65 years was either fairly stable or showed a downward trend result of these developments has been to bring the current death rates from cancer among white women in the broad age range 25 to 64 to the lowest levels on record in this third of a century of insurance ex-It is a striking fact that in the ages 35 to 54 the mortality dropped one-fifth between 1911-1913 and 1942–1944

Even among white male policyholders the situation has shown slight improvement in recent years. The distinctly upward trend in the mortality from cancer which was manifest during the first quarter century of this insurance experience has been stemmed, if not reversed. During the past decade, at no age period beyond 25 years has the cancer death rate among these insured men increased, in fact, it appears that at some age periods the mortality has tended downward recently. However, there is good reason to believe that much, if not all, of the increase recorded in the earlier years was more apparent than real. The upward trend probably

reflected the fact that improved diagnostic methods and their greater use led to the discovery, and hence reporting on death certificates, of an increasing number of cases. It is pertinent to note in this connection that about four fifths of the fatal cancers diagnosed among males were in internal sites, and therefore the mortality in this sex was particularly subject to apparent increases with the growing ability of physicians to recognize the disease. Among women, only about one half of the fatal cancers occurred in inaccessible sites.

There is confirmation from other sources as well that the organized movement to control cancer is bearing fruit. The educational campaign, which is a vital part of the whole program, is succeeding in having people, and more especially the women, seek diagnosis and treatment earlier in the course of the

disease, when the chances of cure are best.

The increasing control over cancer may also be attributed to a number of other factors. It is even likely that prevention has played some part. The close relation between cancer of the cervix of the uterus and neglected injuries at childbirth has been generally recognized. With the long-term fall in the birth rate and with marked improvements in obstetric and postpartum care, the incidence of cancer of the female reproductive organs presumably has decreased. Similarly, more attention to mouth hygiene, particularly among men, may have reduced the number of buccal cancers. But far more important, in the total picture, than prevention, has been the constantly increasing number of physicians trained to deal effectively with the disease, the marked increase in the public and private facilities for treatment, and the development of new and improved technics.

#### THE 'PSYCHONEUROTIC'

Sometime sportswriter Bill Cunningham has coquired new stature as he has found new fields in which to try his strength In the January 21 issue of the Boston Herald he took his fling at the stubbornly cherished belief that a diagnosis of psycho-neurosis, particularly when it has been applied to a soldier, constitutes a stigma denoting mental de-terioration or moral weakness

Grave injustices are being done to many thou sands of innocent and capable young men who are sands of innocent and capable young men who are being projudiced in their opportunities to re-enter industry end normal civilian life, and it is at least partly the job of the country's doctors to educate the public to a better understanding of the profes-sion's more commonly used terminology. To the lay mind, opparently, any word containing the root "psycho" (from the Greek, meaning soul derived from the word Paychea, layed maiden with years. from the word Psycho-a lovely maiden with wings like a butterfly) implies organic disease of the soul or mind, in other words insanity—and there seems to be no doubt in Greek mythology that Cupid was crazy about Psycho

The shell shock of World War I, which was an induced psychoneurosis, was considered to have been brought about by physical forces and consequently was an illness that respectable soldiers could have. The same forces, acting on the mind by more subtle agencies than violent sthereal disturbences, place their victims in the ranks of the untouchables distrusted by industry and frequently beld in contempt by friends and family. The polite term "battle fatigue,' which has been offered as a substitute for the quasi-ecientific psychoneurous, suggests the warrior worn ont in the defense of his country hence an acceptable hero worthy of sympathy and help
A literal-minded medical corps apparently did not

realise the trouble that could be caused by the unguarded classification of disease. Either it under-rated the velocity, impact, and explosive force of the "psycho" root, or it overestimated the intellectual capacity of the general public on the home front-At any rate, the damage was done and our hats ere off to Bill Cunningham for his discerning effort to undo it.

In the February 1 issue of the Journal, Lieut, Col. Jackson M. Thomas emphasized the distinction between genuine psychoneurotics and many of these soldiers whose emotional stability has cracked after a greater or less exposure to the enormous psychio traums of combat conditions. The genuine psychoneurotic a victim of hidden conflicts is a person otherwise normal who cannot face certain situations of everyday environment. The soldier with a simple adult maladjustment is a normal person who has passed his limit of reacting normally to shoromal environmental conditions. It must be recognized moreover that soldiers thus wounded are often among the finest and bravest that an army pro-duces. The best thing that can be done for them is to treat them like the other sick and wounded, not classifying and grouping them with the psychotic.

In closing, it does not seem inappropriate to point out that many of the actions of the average man savor of the psychoneurotic, that some of our most brilliant generals occasionally exhibit lack of selfcontrol, that one of the greatest leaders of the Civil War was forced to give up his command for several months, being sorely beset by doubts, that not only genius but even courage may follow various paths, not all of them obvious to every one The breaking point of any substance is determined not entirely by its own resistance but elso by the type as well as the degree of force applied to it.—New England J M., March 8, 1945

### REVIEWED

Synopsis of Diseases of the Heart and Arteries By George R Herrmann, M D Third edition Duodecimo of 516 pages, illustrated St Louis, C V Mosby Co, 1944 Cloth, \$500

This thin duodecimo of 500 pages, now in its third edition, is written in fine style, almost English in type, but with the usual American omission in the text of the personal pronoun "I". This reviewer hungers for the occasional use of such pronouns in reflecting the emphasized individual opinions of authors.

The book is far from the usual synopsis, giving a wealth of well-presented material that would put to shame some so-called textbooks. No essential subjects are omitted. The electrocardiographic section is ample. The arrangement of the text is excellent, the one hundred and three illustrations are better than average, and, praise be, the index is splendid! The volume can be highly recommended.

FRANK BETHEL CROSS

Global Epidemiology A Geography of Disease and Sanitation. By James Stevens Simmons, M D, Tom F Whayne, M D, Gaylord West Anderson, M D, Harold Maclachlan Horack, M D, and col-

laborators Vol I Part One India and the Far East Part Two The Pacific Area Octavo of 504 pages, illustrated Philadelphia, J B Lippincott Co, 1944 Cloth, \$700

The volume under consideration is the first of a series designed to bring together in one work all information now available concerning the incidence and distribution of disease and the medical and public-health facilities at hand in the seven major geographic areas of the globe. The interrelationship of disease with geography, climate, terrain, insect and animal life, natural resources, government, population density, and the economic status and customs of the people is extensively discussed and supported by maps, statistics, and references

Volume I is concerned with India and the Far East, and with the Pacific area Forthcoming volumes will present similar data for Africa, Europe, the Near East, and the Western Hemisphere The authors acknowledge the help of more than a score of collaborators The work appears to be extremely thorough and complete, the type is pleasing to the eye and easy to read, and the subject matter is fas-

[Continued from page 1706]

It is an invaluable reference work whose subsequent volumes will be awaited with interest by all who are concerned with the global relationships of disease and public health

E J TIFFANY

Plaster of Paris Technic By Edwin O Geckeler, M D Octavo of 220 pages, illustrated Baltimore, Williams & Wilkins Co., 1944 Cloth, \$3 00

This book is an extremely valuable contribution. Many of the simple and more complicated procedures, which are generally taken for granted, are clearly illustrated by actual photographs so as to enable the student and the surgeon to apply plaster as it should be applied The photographs are clear and the captions readily explained in the text so as The to make the procedures readily applicable book is highly recommended.

IRWIN E SIRIS

Manual of Military Neuropsychiatry Edited by Harry C Solomon, M D, and Paul I Yakovlev, MD, with the collaboration of Lt Col Wilfred Bloomberg, (MC), AUS, et al Duodecimo of 764 pages, illustrated Philadelphia, W B Saunders Co, 1944 Cloth, \$6 00

Neuropsychiatric casualties in military service comprise about one-third of all casualties in the war This subject has arrested the attention not only of physicians but lay people as well The manual unphysicians but lay people as well The manual under discussion is, therefore, a most opportune book and one that should have a wide circulation among doctors, for it is the duty of all physicians to familiarize themselves with the subject The authors, with the aid of many collaborators, have made an exhaustive survey of the various neuropsychiatric conditions that are apt to occur in military service It is presented in a brief but lucid manner, and the result is a most valuable little volume on a very timely and vital subject It is highly recommended to all intelligent medical men

IRVING J SANDS

Essentials of Pharmacology and Materia Medica for Nurses By Albert J Gilbert, M D, and Selma Moody, R.N Second edition Octavo of 290 pages, illustrated St Louis, C V Mosby Co, 1944 Cloth, \$2 50

This second edition includes a brief sketch of some of the more recently introduced drugs, such as penicillin, sulfadiazine, sulfaguanidine, succinylsulfathiazole, diethylstilbestrol, evipal sodium, adrenal cortex extract, aluminum hydroxide gel, and crystillia. talline zinc insulin. Some minor changes have been made to make the names of preparations conform to the latest U.S. Pharmacopeia, National Formulary, and New and Nonofficial Remedies

As the title implies, only the essentials are given, the entire book consisting of but 290 pages book allegedly follows the Curriculum Guide for Schools of Nursing, which, however, lists as one of the five objectives of the course the following "To gain some appreciation of the social problems resulting from the indiscriminate use of drugs, in order to be able to aid effectively in the prevention and treat-ment of such conditions" Yet in the book under review only seven lines on page 26 are devoted to this important problem. In the attempt to write a short work on pharmacology the authors have oversimplified the subject.

The inclusion of true and false questions in the

Appendix is bad from a pedagogic standpoint. It is apt to fix false statements in the minds of the pupils

In spite of these shortcomings the book is a suitable text for those smaller schools of nursing which do not adhere to the minimum of thirty hours for pharmacology as called for by the National League of Nursing Education

CHARLES SOLOMON

Red Lights on The Honzon By H Ameroy Hartwell, M D Duodecimo of 22 pages, illustrated Boston, Bruce Humphries, 1944 Board, \$100

In this helpful little book of verse, consisting of only 21 pages, the author suggests that the best way to retain good health is to seek an early examination when symptoms of disease first arise He emphasizes the fact that early treatment is the safest course, whereas delay might mean more serious complications or even death.

ARTHUR C JACOBSON

The Sources of Life By Dr Serge Voronoff, M D Octavo of 240 pages, illustrated Bruce Humphries, Inc., 1943 Cloth, \$3 Boston, Cloth, \$3 50

This book is written for the laity. It is well written and reads easily. Voronoff exaggerates the role of the sex gland in human physiology claim to fame is the grafting of simian testes into the scrotum of the male He states that other workers have doubted the "phenomenal" duration and activity of his heterologous transplant in humans and animals With the advent of sexual-hormone replacement therapy and the "good" results obtained by certain authors in the amelioration of degenerative processes in the aged, it is a timely reminder of his method to the laity He offers this method as a ray of hope for the old in their conquest of senility for sexual and psychic improvement

BERNARD SELIGMAN

A Method of Anatomy Descriptive and Deductive By J C Boileau Grant, M D Third edition Quarto of 822 pages, illustrated Baltimore, Wil-hams & Wilkins Co, 1944 Cloth, \$6 00

This book is not to be regarded as a textbook on anatomy and it is not recommended as such, but it does give useful suggestions as regards general It calls attention to certain fundamental facts in the structure of the body and makes it much less difficult for the reader to remember the relationships of the various parts of the body, than do many of the textbooks

WALTER SCHMITT

The Medical Clinics of North America delphia Number November, 1944 Index 1942– 1944 Octavo Philadelphia, W B Saunders Co, 1944 Published Bimonthly (six numbers a year) Cloth, \$16 net, paper, \$12 net

This series of articles covers a wide field proximately one half of this volume was contributed by the Pennsylvania Hospital unit overseas, and deals with their special problems and methods Malaria, mite typhus, the dysenteries, and other particular diseases are discussed in this section Several excellent articles are found in this and the The usual high standard 18 more general section maintained, but a major portion of the interest is for those especially interested in overseas problems

## When Weight Gains

### ARE NEEDED

For the underweight patient just recovered from severe acute or chronic illness, increase in weight may be difficult to achieve with the customary high-caloric diet. Yet restoration of normal fat deposits and correction of nutritional deficiencies are essential for rapid return of strength and resistance to infection.

The intake of essential nutrients high in calorific value is expeditiously accomplished by including Ovaltine in the diet This tasty food drink, made with milk as directed, is enjoyed by all patients both as a mealtime beverage and between meals. Not only rich in calories, it also provides generously other nutrients urgently required biologically adequate proteins, highly emulsified fat, B complex and other vitamins, as well as the essential minerals iron, copper, calcium, and phosphorus. The low curd tension of Ovaltine favors quicker gastric emptying, hence the appetite actually tends to become enhanced through this desirable behavior.

THE WANDER COMPANY, 360 N. MICHIGAN AVE., CHICAGO 1, ILL.

## Ovaltine

Three daily servings of Ovaltine, each made of  $\frac{1}{2}$  oz. Ovaltine and 8 oz. of whole milk,\* provide

When infection impairs Vaginal physiology Most infections of the lower genital tract disrupt normal vaginal physiology, resulting in lowered acidity or even alkalinity Clinical evidence has shown that a restoration of the normal pH constitutes the simplest, most direct form of effective therapy · Aci-jel, a bland, water dispersible, buffered, acid jelly provides a ready, efficacious method of inhibiting the growth of pathogenic organisms by restoring the normal vaginal flora . The usual dosage is 5 cc. (one applicator full) intravaginally before retiring and again in the morning, followed 8 hours later with a cleansing douche Acı-jel is available in 3-14 oz tubes, with or without measured applicator ORTHO PRODUCTS, INC . ### REMOVE THE FOUR HYPOS

HYPO EPITHELIUM (a decrease in the number of cell layers composing the vaginal mucous membrane, due to inflammatory hyper-desquamation).

FIORAQUIN by allaying the inflammatory reaction, destroying the pathogenic organ isms and providing carbohydrates for mucosal glycogen facultates regeneration of the mucosa to normal

2. HYPO GLYCOGIN (due to a marked decrease in the number of glycogen bearing cells of the vaginal mucous membrane).

FLORAQUIN makes available carbohydrates lactose and dextrose for absorption by the regenerating vaginal epithelium, and storage in the form of glycogen

3. HYPO-ACIDITY (usually the veginal pH is close to neutral or even alkeline—pH 3.3 to 7.8)

FLORAQUIN provides a bacteriostatic acidity which, mixed with the vaginal secretion re-establishes and maintains the normal pH of 38 to 44

4 HYPO-DÖDERLEIN (a reduction or elimination of the Döderlein bacilli, the normal flora of the bealthy regina)

FLORAGUIN provides the ideal medium for the return and cultivation of the Döderlein bacillus which, by its action upon released glycogen aids in maintaining normal acidity

## BLOBAQUIN

a product of Searle Research, contains the protozoacide, DIODOQUIN, combined with lactose, dextrose and bonc acid

Supplied in powder for office insufflation and tablet inserts for supervised bome use

Award and property as the related flatester of o D Series & CO. Concello M. Hillion.

## TEAMWORK IN SCIENCE CREATES

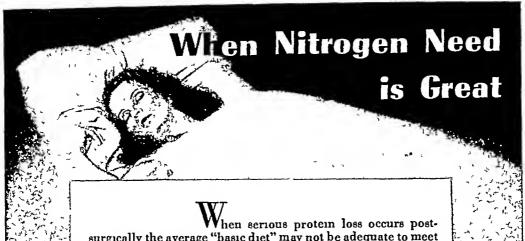

## CHEPLIN PENICOLLIN

We take pride in the new \$3,000,000 Cheplin Penicillin laboratories, but we take even greater pride in our staff of scientists who manage and operate them

Less than two years ago there was a cornfield where these laboratories now stand A group of hand picked scientists composed of bacteriologists, pharmacologists, medical men, toxicologists, chemists and chemical engineers, working as a team have created Cheplin Penicillin

To our staff goes full credit for making Cheplin one of the largest producers of penicillin in the world. When you need penicillin — specify Cheplin, the achievement of teamwork in science.

When serious protein loss occurs postsurgically the average "basic diet" may not be adequate to meet the nitrogen requirements <sup>1</sup> A high protein diet will under certain conditions replace the nitrogen losses but when the necessary intake level cannot be reached or such a diet is not tolerated in sufficient quantity, supplementation becomes necessary.

Inadequate protein intake and depleted reserves bave a relation not only to such concomitants of surgery as anesthetic damage, shock and wound healing, but also to resistance to infection, since protein is intimately linked with the mechanism of natural resistance as well as with the production of anti-bodies.<sup>2</sup>

When nitrogen need is great and supplementation becomes necessary, AMINOIDS\* may be depended on as a source of readily assimilable amino acids, including those indispensable for the maintenance of human nitrogen balance, as determined by Rose <sup>3</sup>

AMINOIDS, a protein hydrolysate product derived by enzymic digestion from beef, wheat, milk and yeast, is soluble in hot or cold liquids. It is palatable, thus assuring ready patient acceptance.

Two tables poonfuls of AMINOIDS t. 1. d. provide approximately 24 grams of protein as hydrolysate.

Available in bottles containing 6 ounces

# A Five-Pronged Therapeutic Approach

In peptic ulcer, gastritis, and gastric hyperacidity, Kamadrox (magnesium trisilicate, 50%, aluminum hydroxide, 25%, colloidal kaolin, 25%), presents a five-pronged approach it is an acid, astringent, demulcent, adsorbent, and protective

Kamadrox exerts a powerful, prolonged acid-neutralizing action. Its use is not attended by "secondary acid rise," nor does it lead to alteration of the acid-base balance. The characteristic ulcer pain is promptly relieved. Particularly advantageous is the feature that Kamadrox is less likely to produce constipation or loose stools, even when taken over long periods. Its pleasant taste is appreciated by the patient.

Kamadrox powder, permitting adjustment in dosage, is supplied in 4-oz and 1-lb packages Kamadrox tablets in bottles of 100, 500 and 1,000 Each tablet contains Magnesium trisilicate . . . 4 grains

Magnesium trisilicate . . . 4 grains
Aluminum hydroxide . . . . 2 grains
Colloidal kaolin 2 grains

Dose, 1 or 2 tsp of the powder, well dispersed in water, t.i d, pc Of the tablets, 2 with water, t.i d, or q i d

### Vital Support in Modern Surgery

All the wealth of modern surgical skill and knowledge may be tragically unavalling if the patient is physically unfit for operation. In poorly nourished patients, preoperative correction of hypoproteinemia lessens surgical risk—hastens healing. Parenamine—clinically proved parenteral substitute for dietary protein—restores and maintains positive nutrogen balance corrects hypoproteinema—stimulates regeneration of tissue and serum proteins.

## Parenamine

AMINO ACIDS STEARNS PARENTERAL

### For protein deficiency

PAREMANTH is a seefle is per cert tocition of all the nation acids haven to be e-excital for humans, derived by acid hydrolysis from co-cia and fortided with pare di-trypopalases. Serifity freedom tron pyogens, and standardization of each harch are resistentially therefore bloomary procedures, around seeling, and injection of full therapeaule doses clinically

properation in protein deficiencies and conditions of restricted intake, tasky absorption increased used, or excessive loss of proteins. Particularly useful in

preoperative and postoperative management, rephrotle-tenenia of pregnancy extensive burns, delayed bealing, gustranaturinal disorders, cirrhosis, septimotis, fevers, and other bypermetabolic states.

ADDITIVISTRATION may be intravenous, intrasternal or substanceous. Dougle may be estimated at 1 Ges aratino acids per kilogram of body weight per day plus sefficient excess to correct the exist ing deficiency.

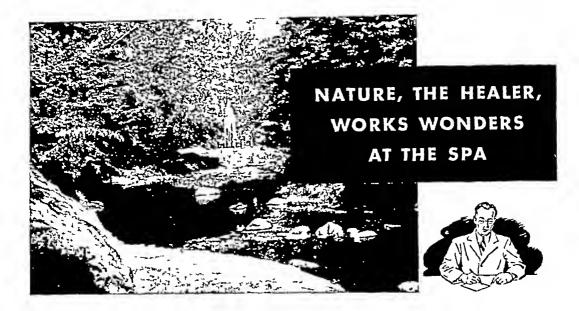

SUPPLIED as 15 per cent sterile solution in 100 to rubber-capped bottles.

DETROIT 31 MICHICAN

NEW YORK KAMIAS CITY CAN PRANCINCO WINGSON, ONTARDO SYDNEY, AUSTRALIA AUGULANS, MEN TEALAND,

The superb man-made facilities at the Saratoga Spa are placed in a setting of great natural beauty In this serene environment a sick person is ideally prepared for the full benefit of medical care

Here your patient is relaxed in both mind and body, so that the therapeutic values of the Spa's naturally carbonated mineral waters are enabled to exert their maximum efficacy

Your patient suffering from such conditions as cardiac, vascular or

rheumatic disorders receives the benefit of the Spa's restorative powers under a regimen of treatment which you yourself recommend

Well trained physicians are available in Saratoga Springs for consultation with your patient on the details of the program.

With your patient at the Spa, you find needed relief from wartime strain in the knowledge that your directions for his continuing care will be faithfully carried out.

### "PHYSICIAN, GIVE HEED TO THINE OWN HEALTH"

Many physicians have recently come to the Spa for the same kind of treatments that helped their patients here After a restorative "cure" at the Spa, you, too, would return to your practice refreshed—revitalized—ready for the busy days that still he ahead

### THE EMPLRE STATE'S CONTRIBUTION TO THE MEDICAL PROFESSION

For professional publications of the Spa, and physician's sample carton of the bottled waters, with their analyses, please write W S. McClellan, M D., Medical Director, Saratoga Spa, 155 Saratoga Springs, N Y

it is now established that antirachiffe protection must be given, not only in the first years of life, but main tained until the child has reached at least 14 years of age

Follis R. H. Jr., Jackson, D. Ellot, M. M. and Park, E. A., Prevalence of Rickets in Children Between Two and Fourteen Years of Ages Amer. J. Dis. Child., 66s (July) 1943.

In children beyond the period of infancy, because of objection to taste or routine, it frequently is difficult to maintain effective prophylaxis against rickets—and provide adequate treatment for this and other vitamin D deficiencies with the use of cod liver oil and other types of vitamin D in low potency units where daily dosage is necessary

iNFRON Pediatric provides a convenion lent, new method of effective antirachitic treatment and prophylaxis. Each capsule contains 100,000 U.S. Punits of electrically activated vaporized ergosterol (Whittier Process)—highly purified and specially adapted for pediatric use

Infron Pediatric

Only one capsule is required each month for prophylaxis against rickets and treatment for rickets

Infron is the registered trademark of Natrition Research Laboratories

### The DISTENDED PENDULOUS ABDOMEN

Authorities agree that excessive weight gain is abnormal. The forward weight of the distended abdomen exaggerates the curves of the spine and as the weight of the abdomen increases there is a direct pull on the fasciae and muscles in the lumbar region with the increased dorsal curve allowing descent of the lower ribs and flattening of the diaphragm. The heavy breasts drag on the round shoulders.

While awaiting the effect of dietary regimen, many physicians prescribe a CAMP Support in order to relieve the strain of faulty body mechanics, increase the excursions of the diaphragm and aid the return of venous blood to the heart.

The upright sections of the support, based upon a firm foundation about the pelvic girdle, hold the heavy abdomen up and back more nearly over the supporting joints, this assures rest and support to the lumbar and dorsal spines. Note that the gluteal region receives proper support.

THE GASTROINTESTINAL TRACT OFFERS ONE OF THE CHIEF LOCI FOR THE SUCCESSFUL THERAPEUTIC ACTION OF BELLADONNA PREPARATIONS"

when the G. J. Tract "KICKS UP"

Administered in the presence, of peptic vicer, spastic calitis, mucaus calitis, spastic constitution, diarrhea, pylara spasm, cardiaspasm and ather, evidences of smaath muscle spasticity in the gastrointestinal tract—Donnatal affords all the advantages inherent in the pure, natural belladonna alkalaids in exerting peripheral action without taxicity. At the same time it provides non narcotic sedation.

Dannatal is a rational, balanced combination containing fixed proportions of the only belladonna alkaloids possessing therapeutic importance (hyoscy amine, atropine and scopolamine), with minimal dasage of phenobarbital (1/4 gr per tablet). The pharmacodynamic synergism provided by the three individual alkaloids—plus the sedation afforded by its barbituric acid component—renders Donnatal especially efficacious for long term medication without danger of over sedation. Of interest to many patients, Dannatal may be prescribed at approximately half the cost of synthetic preparations?

## SIMILAC

SIMILAR TO HUMAN MILK

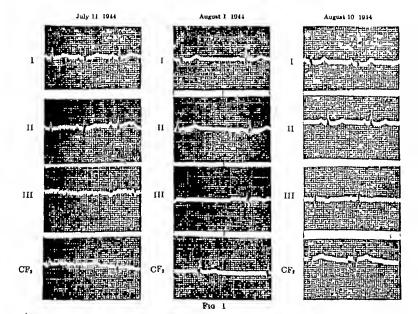

A powdered, modified milk product especially prepared for infant feeding, made from tuberculin tested cow s milk (casein modified) from which part of the butterfat is removed and to which has been added lactose, olive oil, coconut oil, corn oil, and fish liver oil concentrate

Similar provides breast milk proportions of fat, protein, carbohydrate and minerals, in forms that are physically and metabolically suited to the infant's requirements. Similar dependably nourishes—from birth until weaning.

One level tablespoon of Similac powder added to two ounces of water makes two fluid ounces of Similac. This is the normal mixture and the caloric value is approximately 20 calories per fluid ounce.

M & R DIETETIC LABORATORIES, INC - COLUMBUS 16, OHIO

monocytes. The blood culture was still negative in view of the decrease in his leukocyte count and the lack of response to therapy so far it was doemed advisable to discontinue sulfonamides and confine treatment to penicilin and hepara.

On the next day the patient appeared generally improved, although the proptons of the left eye was more pronounced and the edema about the eyelids had increased. The ophthalmoplegia in the left

eye was still complete.

On July 10 the patient's condution was still unanged. Proptoss of the left eye was still marked and the ophthalmoplegia and papilledems were still present. Bilaterial Oppenheim reflaxos and saklo clonus were present. In addition, the patient had a moderate amount of "wheesing" and a few most rales were heard in both bases, and breath sounds were somewhat dimnished here. The dosage of penicillin was increased to 100,000 units intramuscularly every four hours.

On the following day the eye signs remained practically unchanged, except for a slight roturn of downward rotation in the left eye. The patient was lucid, but felt extremely weak, and complained of pains in the left pectoral region. He was moderately eyanotic. Wheening respiration and baster rales were increased. The heart sounds were definitely muffled, distant, and of extremely poor quality Blood pressure was 120/70. An electro-

cardiogram showed sinus arryhthmia, low voltage, and fisttening of all T-waves. A diagnosis of toxic myocardits with congestive failure was made. He was digitalized at a moderate rate and given oxygen and diurettes. He responded well to this therapy, as indicated by a marked increased diures and improvement in his cardiorespiratory status.

The patient improved gradually, the temperature reached normal on July 14 and the edema about the left side of the face began to subside. The course continued uneventfully from July 15 for ten days, during which time saids from minor disconforts, he slowly but progressavely improved. The proptosis and pepilledema in his left eye had almost completely subsided. Aside from a slight recovery of downward rotation, he still had complete ptosis and ophthalmoplegan of his left eye. Visson was only moderately impaired. The bilateral Babinski and ankle clonus gradually disappeared.

On July 25 the patient experienced severe dysuria and frequency, which was caused by the presence of an indwelling catheter, for persistent urinary retention. The urmary findings showed numerous put cells and a marked trace of albumin. The temperature rose to 102 F and bladder irrigations with potassium permanganate and boric acid failed to relieve the patient. His distress was so acute that 15 grains of sulfathiazole were given. This was followed within three hours by a severe chill and

#### CAVERNOUS SINUS THROMBOSIS WITH RECOVERY

HYMAN BELSKY, M D, Mt Vernon, New York

RECENTLY there have been several cases reported in the literature of cavernous sinus thrombosis with recovery Prior to the advent of penicillin, this condition almost invariably terminated fatally, and recovery, even with sulfonamide therapy, was rare

The following case, aside from its complete recovery, possessed several other interesting features

#### Case Report

S B K, a white man, aged 52, complained of moderate headache over the left frontal region on July 1, 1944. He sought relief by lying in the sunshine for about two hours, but the headache became progressively worse, and soon this was accompanied by persistent nausea and vomiting, which was not projectile in type He had no fever and gave no history of chronic headache or migraine

The following day the headache was unchanged, the vomiting was still present but not as persistent On the third day the patient's headache was still very severe and at this time his temperature rose to 104 F His pulse was 90 and his respiration 15,

whereupon he was hospitalized

The past history was essentially unremarkable, except for the following About June 4, 1944, the patient had a furuncle on the upper lip, left side This spread soon to the left nostril and was associated with an extensive induration in this area, with marked edema of the left side of the face, involving also the left eyelids. This was accompanied by fever of 101-102 F, but after about a week's treatment the furuncle responded to sulfathiazole therapy, and the patient was completely recovered for a period of about two weeks prior to the onset of the present illness

Physical Examination — The patient was acutely ill, toxic, and in marked pain. There was definite meningismus present. There was no tenderness over the nasal accessory sinuses, and there was no edema of the face or any evidence of the previous infection of the face There was ptosis of the left lid left pupil was in mid-dilatation and did not respond to light or accommodation There was complete third-nerve paralysis with slight sixth-nerve weak-ness. The fundus appeared normal. The right eye was normal in all respects. The other cranial nerves

werc normal

The mouth, throat, ears, lungs, and heart were normal. The blood pressure was 120/80 The abdomen was distended and soft and kidneys were not palpable distended, with urinary retention the extremities were normal. There were no petechnae present. The deep refleves were hyperactive. There was a present of a biletone to the control of the suggestion of a bilateral positive Kernig's sign.

Laboratory Findings —A spinal tap, done on admission, showed the following clear fluid, 150 mm pressure, 10 cells, 90 per cent lymphoeytes, total proteins, 20 mg per cent, albumin, 2 plus, globulin, 1 per cent, sugar, present, culture, sterile, and Wassermann, negative. The blood culture was negative The white blood count was 9,550

-75 per cent polymorphonuclears, 7 per cent
immature, and 25 per cent lymphocytes. The
red blood count was 4,580,000, hemoglobin, 88 per cent, and the sedimentation rate, 6 mm

in one hour The urine showed a trace of albumin, hyaline casts, and 3-4 white blood cells per highpower field

An x-ray of the skull was essentially negative. except for the presence of a large sella turcica. The accessory sinuses were normal

The provisional diagnosis was
1 Thrombophlebitis of the left inferior ophthalmic vein, with beginning left cavernous sinus throm-

2 Brain abscess in the region of the left sphenoidal fissure

Toxic encephalitis with edema in the region of the left sphenoidal fissure

Course in Hospital and Treatment -The patient was given 4 Gm of sulfadiazine on admission and 1

Gm every four hours thereafter

The following day, July 4, although his temperature was somewhat lower, he was unimproved and his headache was still very severe. The ophthalmoplegia showed further progression and there was now complete ptosis of the left lid Blood culture taken on admission was sterile, and in view of the probablility of a staphylococcic infection sulfathiazole was substituted for sulfadiazine. In addition, penicillin was started in doses of 25,000 units every

four hours intramuscularly On July 5, after receiving 150,000 units of penicillin together with sulfathiazole, the patient's condition became precarious Although his temperature had dropped, his pulse rate rose to 140 and was of poor quality, he rapidly became delirious and moribund. Penicilin was increased to 50,000 units intramuscularly every three hours, and 5 Gm of sodium sulfathiazole was given intravenously in normal saline In addition to this, continuous heparin infusion was begun The patient now had complete ophthalmoplegia in the left eye, as well as an advancing papilledema. The abdominal reflexes were absent, and he had a bilateral positive Babinski

The patient was seen in consultation with Dr Israel Wechsler and Dr W D Wingebach, who concurred in the diagnosis of cavernous sinus throm-

On July 6 the patient appeared more lucid, and although his temperature rose, his pulse rate de-clined sharply and was of better quality In addition to the regular intramuscular dose of 50,000 units of penicillin, an additional 100,000 units of penicillin was given intravenously

The temperature continued to rise, although his pulse rate remained relatively constant cervical spasm was not as pronounced as on admission. The left eye showed definite proptosis, with subconjunctival edema, and there was definite edema about the eyelids and the left side of the face There was also a definitely choked disk present in Bilateral ankle clonus and Babinski the left eye

sign were present

The patient had a severe chill on July 8, after which his temperature rose sharply to 105 F, and he became delirious The regular dosage of penieillin was therefore supplemented by 100,000 units given intravenously with heparin in normal saline His red blood count was now 3,680,000 with 65 His white blood count was per cent hemoglobin 4,850 with 62 per cent polymorphonuclears, 10 per cent immature, 35 per cent lymphocytes, and 3 Surgeon General may necrease these days to a maximum of one bundred and twenty days,

The Personal Health Service Account shall have credited to it amounts equivalent to 3 per cent of wages on which there is a payroli tax for social security

Provision is made for grants-in-aid for modical education, research, and provention of disease and dusability Applications for such grants-in-aid must show that projects have promise of making a con tribution to education and training of persons needed in furnishing medical, dental, nursing, boental, laboratory, rehabilitation, and other bonefits or will contribute to knowledge of disease and its prevention.

Preference in the first five years will go to aiding servicemen seeling postgraduate education as medical or dental practitioners or training for administration of personal health services or other benefits in this bill.

#### MODERN HOSPITAL SPONSORS ESSAY COMPETITION ON PSYCHIATRIC CARE

The sornest spectacle in hospital service today is the treatment accorded the psychiatric patient. Herded in a large isolated state hospital or in an unstandardized proprietary or voluntary institution, the patient often gets little more than custodial care. It is medical care may or may not be scientific and efficient, his doctors, although often davoted, are usually underpaid and overworked. His nursing care is likely to be skimpy. His attendants may be poorly trained or indifferent and sometimes even brutal.

Often nobody takes time to outline and carry on a program of intensive and constructive therapy which fully utilizes present knowledge Somo state and voluntary hospitals, of course, are exceptions, a few are very superior institutions indeed.

Generally speaking, neither the profession nor the public has effectively demanded that standards for care of psychiatric patients be maintained at a high level, that adequate funds be provided to operate good psychiatric hospitals or units, and that staffs be top grade and kept at the highest pitch of enthusiasm and ability

Each state and community in the United States and each hospital should have a plan for improving its bospital treatment. For a community or state such a program involves (1) the training of an adequate number of competent psychiatriats, psychologists, psychiatrio nurses, psychiatria social workers, occupational recreationsi, and other therapists, attendants, and associated personnel, (2) the encouragement of research that will discover new technics for treating psychiatric patients and will refine and improve existing technics, and (3) the creation of strongly organized public and professional opinion that will demand high standards of treatment and will insist that personnel, physical facilities, and funds be sufficient to achieve such standards.

To make a contribution to such a program is the purpose of the seasy competition being aponsored by the magazine, Modern Haspial. Three outstanding authorities on bospital treatment of paychiatric patients will judge the essays. They will be drawn from the United States Public Health Service, the American Psychiatric Association, and the National Committee for Mental Hymans.

The competition is open to anyone except the judges and employees of the Hodern Hospital. Hospital administrators, paychiatrists, psychologists, social workers, nurses, therapists, former putents and any other interested persons are eligible to compete. Two or more persons may write a joint essay.

The camps shall not exceed 5 000 words in length.
Shorter essays are preferable. They shall be typed
double space on one side of the sheat only. An
original and two legible carbon copies must be subcritical.

mitted.

Essays shall be mailed to the Managing Editor, the Modern Hospital Publishing Company, 919 North Michigan Avenue, Chicago 11 Illinois, in time to reach that address by October 1 1945 An exasys received after October 1 shall be eligible for consideration only if they were mailed within the

consideration only if they were mailed within the continental United States prior to midnight of September 25 Winners will be announced on or before December 31 and notified by telegram. All other entrants will be notified by mail as soon as possible. The decision of the judges will be final in case of a tie, duplicate price will be granted.

The csays submitted must have no mark or name which could serve as a means of identification of the author although his return address may appear on the outside envolope. With each entry must be onclosed a plain, opaque scaled envelope without any name on the outside but containing the name and address of the contestant. This envelope will be identified with the accompanying entry by the managing editor of the Modern Hospital and will be opened by him in the presence of witnesses after the jury has reported its decision.

the jury has reported its decision.

The contestant's plan for improving hospital treatment and care of psychiatric patients should not be narrow, covering only a single segment of the problem, but it can attack the entire subject from a special point of view, such as that of the administrator of a general (as well as a psychiatric) hospital, or that of the psychiatric social worker, nurse, attendant, public relations director, or the patient himself or his relations that is not wanted is a scientific medical treatise. Contestants are urged to use imagination and to present new and promising ideas even though they may not have been actually tested as yet.

ty Board, and with the advice of the Advisory Council But there seems to be no real restriction on his powers

The Surgeon General is empowered to

1 Arrange for availability of benefits and availability of reports required to determine disability

2 Negotiate agreements with agencies and individuals to provide services and pay fair and reasonable compensation for services and facilities

3 Give preference to utilization of the facilities of state and local agencies in the administration of

this section

4 Delegate to any officer or employee of the Public Health Service and of any Federal, state, and local cooperating agency such of his powers and dutics, except that of prescribing regulations

5 Appoint local area committees to aid in

administration

#### Advisory Council

As in the last bill, there is a National Advisory Medical Pohcy Council with sixteen members appointed by the Surgeon General and having medical and other representation "in such proportion as are likely to provide fair representation of the interested groups that furnish and receive health services"

The Council's function would be purely advisory The Surgeon General may consult the Council on such matters as policy, administration, professional standards, designation of specialists and consultants, and methods of stimulating high standards

The Surgeon General appoints this committee,

but he is not required to take their advice

The Council is also authorized to establish special advisory, technical, regional, or local committees to advise on special questions

#### Appropriations

Sufficient sums shall be authorized for the first and each subsequent year for necessary expenses in carrying out the duties of the Surgeon General including printing of forms and reports, making studies and demonstrations, training of personnel and promoting efficient administration, and for travel expenses of commissioned officers

The Public Health Service is authorized to ap-

The Public Health Service is authorized to appoint personnel for administration of this service, without regard to limitations specified in the Public

Health Law

#### Method and Policies of Administration

Any individual or group of physicians, dentists, and nurses qualified legally by the state will be eli-

gible to give service

Individuals may choose their own doctor or change at will from those participating in the government plan Groups may choose through their representatives

Specialist and consultant services shall be those so

designated by the Surgeon General.

In establishing standards, those set up by professional agencies will be utilized—but the needs of individual areas will also be taken into account

Specialist or consultant service shall be given only on the advice of general practitioners or on request

to a medical administrative officer

Payments to general medical and dental practitioners shall be on a fee for service, per capita, or salary basis, or a combination of the three as groups in each area choose

The Surgeon General is authorized to make payments, by methods other than that chosen by the

majority of practitioners in the area, to those who may desire another method, especially if the alternative method is more convenient for providing service

The Surgeon General may negotiate cooperative agreements to utilize inclusive services of hospitals

and their resident and/or visiting staffs

Rates of payment shall be adequate in terms of annual income customarily received by physicians, dentists, and nurses To maintain high standards of service, maximum limitations to the number of patients shall be prescribed

Home-nursing benefits will be available ordinarily on the advice of the attending physician, or when requested of a medical administrative officer.

requested of a medical administrative officer

#### Hospitals

The Surgeon General shall publish a list of participating hospitals after deciding the status of institutions

Any hospital not accepted may petition for a hearing. The Surgeon General may not control or supervise a participating hospital unless it is owned and operated or leased and operated by the United States.

Not less than \$3 00 or more than \$7 00 shall be paid for each day of hospitalization not in excess of thirty days, not less than \$1 50 or more than \$4 50 for each day of hospitalization in excess of thirty days, and not less than \$1 50 and not more than \$3 50 for each day of care in an institution for the care of the chronic sick (There is nothing to indicate who decides what conditions will call for hospitalization)

Instead of compensation as above, the Surgeon General may enter into separate contracts with participating hospitals for inclusive hospital services

#### Limitations of the Surgeon General

The Surgeon General is authorized to establish the necessary appeal boards to hear complaints of individuals, practitioners, and participating hospitals (There seems to be nothing in this section that obliges the Surgeon General to accept the decisions of these appeal boards)

Purely professional matters would be heard by an appeal board made up entirely of professional per-

sons

Powers and duties of the Surgeon General are subject to the rights and limitations of judicial review (Section 290)

#### Relation to Workmen's Compensation

Injuries or illnesses that come under Workmen's Compensation and cared for under personal health service benefits are subject to reimbursement to the trust fund

#### Limitations of Benefits

If it is found necessary, the Surgeon General may determine that the individual pay first fees for each sickness or course of treatment in medical, dental, or nursing care

Dental care may be restricted for any calendar year except that for each year benefits shall include examination, prophylaxis, extracting of teeth injurious to health, and treatment of acute diseases of teeth and law

The content of home-nursing service shall be restricted by limiting care to service on an hourly basis

or visiting basis

Maximum days of hospitalization shall be sixty
days

When money in the fund seems adequate, the

A Summary of S 1050—"A Bill to Provide for the National Security, Health, and Welfare Introduced in the U.S. Senate on May 24, 1945

THE 1945 Wagner-Murray Blil contains much that is substantially the same as the former bill. It

has many additional provisions

Where the old bill
numbered 90 pages, the new one totals 185 pages.

The public may be musted by the lowered tax
figure set in this bill. Where the old bill set a 12 per cent payroll tax up to \$3,000 to support its comparatively restricted measures, the new bill has set the payroll deduction at 8 per cent (4 per cent by the employee and 4 per cent by the employer) of sal-

ary up to \$3,600

The self-employed would pay 5 per cent of their estimated income up to \$3 600 as against the 7 per cent on income up to \$3 000 set in the old bill.

Actually, the 8 per cent payroll tax will not pay for the bill's cradle-to-grave provisions. The bill provides that certain programs shall be paid for out

of general rovenue

Senator Wagner himself acknowledges that the 8 per cent figure will not support the social-insurance program and that funds will have to come increasingly from general revenue until it is the Sena tor's expressed hope the government's contribution will eventually reach one third of disbursements. Thus, ne the Senator plously puts it, the "government" will be given an opportunity for financial participation in the program. (Ha does not add that it will also give the taxpayer the opportunity to sign a promissory note with the sum of money left blank.)

Unemployment insurance would be taken from the states and placed with the Federal Government Similarly public employment offices would be changed from the juradiction of the states to that of the Federal Government.

The number of weeks for which unemployment benefits would be paid is extended to twenty-ax weeks and may even extend to a maximum of fifty two weeks. The schedule of unemployment benefits is such that the worker carning \$40 a week when employed could draw as high as \$30 a week

unemployment benefit.

The bill provides for differential grants to states for some of its programs ranging from 25 per cent of total expenditures to the richer states to 75 per cent to the poorer states. (One may predict tho resulting political strategy to obtain favorable formu-

las.)

Although for some programs in the bill some provision is made for administration by state agencies, there is no doubt that the bill would accomplish a tremendous degree of contralisation in the Federal Government with accompanying remote-and not so remoto—control.

Compulsory health insurance is still a large fea-ture of the Wagner-Murray Bill There is some new window-dressing offered by calling it "personal pro-paid health service," and it now includes dental and bome-nursing services in addition to medical, hospital, and laboratory services offered in the original bill.

The Surgeon General is directed to make a study of further nursing and dental benefits other than those provided in the bill and to report on increased costs.

He is also required to make a study of needed facilities for the chronically sick, physically and mentally, and as to prevention of such chronic Ili-

The bill deals with so many Federal agencies that there would be bound to be overlapping of functions. Nothing is said in the bill that prevents overlapping of agency functions.

Briefly S 1050 provides the following

Grants to states for a ten-year program of study and survey of bospital facilities and a ten-year program of bospital and health center construction

Grants to states for extension and improvement of public-health services in rural areas and depressed areas and where services are below the national ex-

pected standards

Development of more effective measures of prevention, treatment, and control of venereal diseases and tuberculosis

Grants to states for establishment and main-

tenance of a dequate maternal and child bealth services Services for crippled children, including locating them and providing medical, surgical, and corrective care, facilities for diagnosis and hospitalization and aftercare of children suffering from conditions which lead to emppling

Grants to states for child-welfare services includ ing control of dependency, neglect and delinquency,

and care of children without parental care

An extensive program of assistance of the needs through cash payments, medical care, and payment for care in foster homes of Individuals under 18 years

of age Unemployment and temporary disability insurance, including unemployment insurance, returnment and survivor benefits, wife's, deabled husband's and child's insurance benefits, widow's retirement benefit, disabled widower's insurance benefit, mother's insurance benefit, parents' insurance benefit, and iump sum death payments

Personal prepaid health service

#### Prepaid Personal Health Service

This is the same section which in the last bill was entitled 'Federal medical, hospital, and related benefits.' In addition to the bospital, medical, and laboratory services it provides for dental and nursing services also

Individuals who qualify and their dependents are entitled to these services. These in the disability, retired or survivor class also are entitled to benefits

under this section

Benefits would also be provided to individuals for whom payments have been to the trust fund on their behalf by some public agency of the United States.

#### Administration

The Surgeon General will have tremendous power and duties no less than in the former bill, and prob-

ably much more

The Surgeon General would have the duty of administering the entire program and of making recommendations as to the most effective ways of provid-ing porsonal health service through social insurance. It is his duty to suggest legislation and administra-tive policy concerning bealth and related subjects. The bill specifies that the Surgeon General work

under the supervision of the Federal Security Ad ministration, in consultation with the Social Securto full duty in forty-eight hours, (5) speed of operation—the average time required for the circumcision, from the injection of the anesthetic to the final bandaging, is usually under fifteen minutes, (6) simplicity—the technic can be learned after watching the instrument used once, and no assistants are required for the operation, (7) safety—as all incisions are outside the clamp, neither the glans nor the penile shaft can be accidentally incised

#### HAZARDS IN THE SALICYLATE TREATMENT OF RHEUMATIC FEVER

Dangers encountered in the administration of large amounts of salicylates recently have been re-Salicylates have long been used in the treatment of rheumatic fever Physicians are familiar with the astonishing relief the drug gives the stricken child Acutely inflamed joints that are so sensitive that they cannot tolerate the weight of the bedclothes soon are able to resume their normal function after the administration of salicylates. The antipyretic properties of the drug are as

striking as are the analgesic effects

Recently Coburn¹ advocated the administration of large doses of salicylates in acute rheumatic fever He recommended the intravenous administration of 10 Gm. of sodium salicylate in 1,000 cc of 0 9 per cent sodium chloride every day for four days Intravenous medication was given slowly over a period of four to six hours, so that sufficiently high concentrations of the drug in the body could be reached and maintained Plasma salicylate values of 400 µg per cubic centimeter could be attained by his method. In fact, Coburn behaved that values of 150 to 200  $\mu g$  , easily attained by oral administration of salicylates, while providing relief from the acute symptoms of rheumatic fever, failed to halt the progress of the disease He contended that serum salicylate values of 350 µg per cc or more must be maintained if the "rheumatic reaction" was to be Protocols of his small series of cases held in check furnished some remarkable results, especially the rapid resolution of the acute phases of the disease, as judged by the quick return of sedimentation rates to normal and the sudden disappearance of clinical Many are not in accord, however, with his thesis of the early curtailment of the damage inflicted by the "rheumatic reaction." It has been pointed out that sufficient time has not elapsed to judge This is fairly the results of Coburn's treatment particularly true in regard to the incidence of mitral heart disease, pericarditis, and pancarditis, common aftermaths of acute rheumatic fever

Large amounts of salicylates cannot be given with-

out careful clinical observation of the patient Deaths and severe complications from salicylates have been recorded 2 Patients should be questioned concerning any sensitivity to salicylates before the drug is given. The appearance of tinnitus, vertigo, deafness, nausea, or other symptoms should indicate the cessation of further administration of the drug Hypoprothrombinemia has been reported to follow salicylate therapy, some have found that adequate amounts of vitamin K' will protect against this contingency

The whole problem of salicylate into acation was recently studied by Fashena and Walkers after their attention had been drawn to the subject by the observation of a patient with salicylate poisoning. They studied 6 children, to whom they gave large amounts of sodium salicylate by mouth every four hours Blood salicylate levels of 350 µg per cc were maintained throughout the study Prolongation of prothrombin time was found in every in-

stance

Rheumatic fever often is accompanied by a widespread vascular damage, thus increasing the hazards of hemorrhagic complications after salicylate When adequate amounts of vitaadministration min K are given with salicylates, much of the danger of these complications may be prevented Possible hazards in the administration of salicylates should be remembered, so that unnecessary dangers may be avoided -J A M A, Feb 24, 1945

#### MEDICOLEGAL CONFERENCE AND SEMINAR TO BE HELD IN BOSTON

The Department of Legal Medicine of the medical schools of Harvard, Tufts, and Boston University, in association with the Massachusetts Medico-Legal Society, will present a six-day program of lectures, conferences, and demonstrations having to do with the investigation of deaths, in the interests of public safety, from October 1 to 6 in Boston.

Attendance during five of the six days of the course will be limited to fifteen persons who have registered in advance On October 3 the program will be open to any physician, lawyer, police official, or senior medical student who may care to attend

Further information may be obtained from the secretary of the Massachusetts Medico-Legal So-

ciety, 25 Shattuck Street, Boston

#### AN INSTRUMENT FOR ADULT CIRCUMCISION

ARTHUR J PHILIP, Lt (MC), USNR, Rockville Centre, New York

INSTRUMENTS for facilitating circumcision as varied as mechanical ingenuity permits. The instrument used for infant circumcision (popularly known as the Gomco clamp) is excellent and is the ideal method of performing this operation during the first month of life, chiefly because individual variation in size of the glans and prepuce at that age is negligible.

However, among young adults such as are seen in the Naval service, variations in diameter of the glans and length of the prepuce occur with almost as much frequency as are seen in height and weight tables, yot all are within normal limits. For this reason, the cup-and clamp method, wildch is very satisfactory, cannot be used except on a limited number of adults who fall into definite norms as regards the length and diameter of these organs. Therefore, it is felt that a new and botter method of performing circumcision must be sought. The purpose of this paper is to describe an instrument to facilitate circumcision in adults.

The instrument is quite simple—so simple, in fact that it was made aboard one of our ships in two hours. It is made of stainless steel and consists of two parts, male and female halves, which fit together by means of a tongue-and groove shde and is easily taken npart for cleaning and steriling. Assembled, the over-all length is 8 inches, the width at the widest part, the handle, is 2½ inches (Fig. 1)

The patient is prepared as for any circumcision. Anesthesia is obtained by infiltration of the skin and mucosa of the prepuce with 2 per cent novocaine. About 8 cc. is required for anesthesia of both layers.

The prepuce is grasped by two mosquito clamps on its dorsal edge, and a dorsal slit is made to a point just proximal to the corona. The instru ment, partially opened, is then slipped into place, the female part of the clamp between the glans and the prepuce, and the male half outside the prepuce, and is adjusted so that the curve of the instrument follows the curve of the penis. The clamp is then closed by pulling the handles together, in this way compressing half the prepuce The redundant prepuce is removed by scissors, leaving a cuff of both skin and mucosa about 1/s inch long extending beyond the edge of the clamp A running catgut suture then approximates these edges, and the clamp is removed. Using the same instrument, the other half of the foreskin

is removed and sutured in a similar manner, thus completing the operation.

In about thirty-five circumcisions done by this method, no hleeding has been encountered, probably due to thrombosis of all the blood vessels caught between the laws of the clamp. There has been a minimum of pain, requiring very little anesthesin (6–9 cc of 2 per cent novocaine) due to pressure anesthesin produced by the clamp. A smooth line of incision is possible because scissors are used throughout with the laws of the clamp acting as a guide line for the amputation. The clamp is applicable to any size penis and is in no way interfered with hy phimosis, paraphimosis, or adhesions between the glans and the prepuise.

The advantages of this method of circumcision may be summed up as follows (1) neater field—the clamp acts as a guide in the amputation of the prepuce, resulting in an even operative line, (2) complete hemostasis—this is due to the pressure of the clamp, which is not removed until the repair has been made, (3) absence of pain—this is due to pressure anosthesia produced by the clamp (4) rapid postoperative healing—edema is at a minimum and, because of the lack of distortion of tassies by the small amount of anesthesia required, healing is rapid. The patients on whom this clamp has been used have uniformly been returned to light duty in twenty hours and

Fig 1 Instrument partially closed

#### RADIOGRAPHY IN RIB FRACTURES

RAYMOND W LEWIS, MD, New York City

(From the Department of Roentgenology, Hospital for Special Surgery)

✓ ISAPPREHENSION as to the value of and L indications for roentgenology in cases of rib fracture or suspected fracture seems wide-The situation is similar to that which existed until all too recently in head injuries, when it was the custom to speed the patient to x-ray examination, regardless of the peril to the patient and without realization that diagnostic roentgenograms are often not obtainable in a patient in shock, coma, or delirium The truth of the matter is that x-ray examination of head injury, unless complications are suspected, should not be undertaken while the patients are in senous condition because (1) the examination constitutes a hazard to the patient, (2) the proper treatment is not dependent on the x-ray findings. and (3) the x-ray findings under these conditions Later examination, when the are unreliable condition of the patient is good, is very much more accurate Published papers on this sublect, such as those of Mock, have done much to clarify the situation with regard to head injuries

Similarly, in rib injuries, unless extensive injury or complications are suspected, the sensible approach is to treat the patient for his injury, and then, approximately six weeks to three months later, if for medicolegal or other reasons a precise diagnosis is desirable, examine him The reasons back of this radiographically recommendation are much the same as those pertaining to head injuries (1) early examination, though not actually a hazard to the patient, is an unnecessary annoyance and discomfort to him and frequently delays institution of treatment, (2) proper treatment is not dependent on the x-ray findings, and (3) the findings of early x-ray examinations are extremely inaccurate, while those of later date are very much more reliable

This third point needs further elucidation. A recent rib fracture without any displacement is usually visible in a roentgenogram only if the rays happen to be directed parallel, or nearly parallel, to the fracture surfaces. Consideration of the shape and course of the ribs makes it evident that the potential diversity of the direction of rib fractures approaches the infinite. Since the common practice of radiologists in rib fractures is to limit the examination to films taken from between one and four different angles, de-

pending upon the thoroughness of the examiner, the chances of showing all or any of the fracture lines by even the more conscientious examiners are well expressed by the ratio of 4 infinity

Between six weeks and three months, roughly, after rib fractures, these usually become rather clearly demonstrable radiographically because of reparative changes which have occurred. These changes are localized osteoporosis about the adjacent ends of the fragments and/or callus formation.

This discussion of theory is well borne out in actual practice. It is a common experience to find no rib fractures in examinations shortly after injury, and then in subsequent examinations after reparative changes have taken place to reveal one or many fractures. And review of the original films, although they were technically good, often fails to disclose fracture lines, even when one knows from the later films exactly where they are located

When, therefore, a radiologist reports on an examination following recent chest injury "no evidence of rib fracture" (which is as far as he can go), that means exactly what it says and no more—that no fracture is visible. Never should the erroneous connotation be read into the report that no fracture exists. But much greater reliance can be placed on negative findings in an x-ray examination some weeks later.

#### Summary

1 In recent rib injuries, as in recent head injuries, early x-ray examination is not indicated unless extensive injuries or complications are suspected

2 This is because (a) early examination causes unnecessary discomfort to the patient and delays institution of treatment, (b) proper treatment is not dependent on x-ray findings, and (c) x-ray examination in recent undisplaced rib fractures in many cases, and probably the majority, fails to show the fractures

3 X-ray examination approximately six weeks to three months after the injury, after reparative changes have taken place, discloses the fractures

4 Negative x-ray findings in recent possible rib fracture cases mean very little Such a report several weeks later is much more reliable.

<sup>1</sup> Mock, Harry E Radiology 41 527 (Dec.) 1943

lation in the wall of the gallbladder, subsidence of symptoms is usually apparent within three days and delay is justified. If, on the other hand, at the end of that period there is mereasing leukocytosis with the development of a palpable mass and increased tenderness and rigidity of the abdominal wall, the progness will become more grave with each day of delay.

The danger of bacterial peritonitis is very slight but the chemical peritonitis caused by a massivo lealage of bile is an extremely serious complication In bacterial infection, if the gallbladder can be removed with secure limition of the cystic duet and artery, the protective powers of the peritoneum, which are at their height after two or three days of the disease, are adequate to overcome any infection of the peritoneal cavity provided the peritoneum and fascia are closed without drainage. The removal of the obstructing stone is extremely important, and this is more easily accomplished in the delayed operation. Cholecystostomy with the cystic duct obstructed is almost always followed by a mucocele and chronic sinus unless the obstructing stone is removed

Omental adhesions to the gallbladder occur early in the disease, but during the first three days they are easily stripped off and do not interfere with the performance of cholecystectomy. Later they become firmly implanted and frequently completely bury the gallbladder, rendering the exposure of the cystic duct much more difficult. At operation performed late in the disease such adhexions always surround a gangrenous gall-bladder and in such cases it is safer to expose the fundus only enough to open it at the most accessible point, remove the stones with scoop or forceps, and macrt a drainage tube into the gall-hladder. In this event a large cigarette drain should be passed beneath the gallhladder to allow the escape of bile which may leak through the purse-string suture surrounding the tube.

Exceptional cases will require divergence from these principles but in general it seems to be agreed that the dividing line between early and late operation is roughly the end of the seventy two-hour period following the onset of acute symptoms. This, of course, does not apply to ordinary gallstone colic but only to those cases that develop the symptoms of acute inflammation.

If the surgeon desires to watch the progress of the disease for three days, he should employ that tune to fortify the patient by adequate fluid intake including the intravenous administration of glucose. Even those surgeons who decide that it is better to operate as soon as the diagnosus made should realize that no case is so urgent at the onset as to prevent all the necessary procedures to overcome dehydration, impaired heart action, or any other condition which may in crease the danger of operation

#### Buffalo-New York Train Schedule

IN COMPLIANCE with Office of Defense Transportation Order No 53, sleeping-car service to destinations 450 miles or less from the point of origin have been discontinued. A fast afternoon train between Buffalo and New York, stopping at Harmon, Albany, Utica, Syracuse, and Rochester, has been placed in service to substitute for sleeping-car service. This train does not carry passengers for Harmon. The schedule is as follows.

Leave New York		3 45 PM	Leave Buffalo	4 00 гл
Harmon		4 36 P.M.	Rochester	5 11 P.M
Albany		6 25 P.M.	Syracuse	0 40 р.м.
Utica		8 09 P.M	Utica	7 33 рм
Syrucuse		9 05 P.M	Albany	9 20 р и
Rochester	1	10 31 P.M	Harmon	11 14 р.м
Arriva Ruffalo		11 45 PM	Arrive New York	12 10 a.m

#### TREATMENT OF ACUTE CHOLECYSTITIS

GEORGE W COTTIS, M.D., Jamestown, New York

THE treatment of acute cholecystitis is probably the most controversial subject in presentday surgical literature There is no difference of opinion regarding the treatment of gallstones Surgeons are generally agreed on two theses First, the presence of gallstones is an indication for operation, even in patients having few or no symptoms If this rule were universally carried out there would be no controversy about the serious complications of cholecystitis, empyema and perforation of the gallbladder, common-duct stone, and hepatitis, because they would no longer occur Second, the removal of a noncalculous gallbladder is almost always a useless and unjustified operation, except in the case of ty-Radiographic nonvisualization phoid carriers is not in itself an indication, it may signify only a poorly functioning liver

The debate centers on the question of when to operate for acute cholecystitis. Some extremists insist that operation should be performed at the earliest possible moment, while others declare that no operation should be performed until the acute stage has passed. Another, and perhaps the largest, group follow a middle-of-the-road policy, treating each case as an individual problem.

Considering the great number of patients treated for this condition it would seem that sufficient data must have been accumulated to settle the matter on a statistical basis. Such is not the case McGuigan, in a recent admirable review of the subject, points out that Heuer, who advocates early operation, reports a mortality of 21 per cent unless perforation has occurred prior to operation, in which case it was 125 per cent, while Taylor reports a mortality of 5 per cent in patients operated upon during the first four days and 24 per cent thereafter In contrast to these figures McGuigan's analysis of 123 cases treated at the Hazleton State Hospital reveals a mortality rate of 12 7 per cent in patients operated upon within seventy-two hours of onset and 23 per cent in those operated upon after that interval

The literature is full of such contradictory statistics. The explanation is probably that different writers have different conceptions of what constitutes acute cholecystitis, and also that there is a variation in their preoperative and postoperative treatment and in their operative procedures. For example, a surgeon who considers every case an emergency and who operates without first adequately fortifying his patient

should have a higher mortality than another who reports as an "early" operation one that is performed after two or three days preoperative preparation

Protagonists of early and of delayed operation have equally plausible arguments for their respective stands As a reason for early operation it is said that acute cholecystitis is similar in its courseand pathology to acute appendicitis and that delay in operating allows the development of empyema, gangrene, and perforation with resulting peritonitis Those who favor delay point out that the acutely inflamed appendix is much more likely to progress to perforation than is the acutely inflamed gallbladder Also, in nearly all cases perforation of the gallbladder occurs only after a period of several days, during which time protective adhesions nearly always are formed, thus limiting the infection to a localized abscess Another argument is that cholecystectomy is more safely performed after subsidence of the inflammation, whereas cholecystostomy must be more often the operation of choice when the walls of the gallbladder are edematous and highly vascular, as they are during the acute stage There is reason in both arguments, and experienced surgeons will recognize their validity while adopting whichever procedure their own experience causes them to favor

Younger surgeons who study the literature of the subject may easily be confused when they discover that equally good authorities are expressing opinions which are diametrically opposed to each other

The average surgeon will find it easier to treat each case on its merits if he has been impressed with the following basic facts Acute cholecystitis is nearly always a result of obstruction of the cystic duct by a stone Theoretically, metastatic infection may occur but in actual practice it is almost nonevistent The mechanism is the same as that of acute appendicitis, which is also nearly always a sequel to obstruction of the lumen When the cystic duct is obstructed, the secretion of mucus increases the hydrostatic pressure within the gallbladder with a resultant slowing of the capillary circulation in the mucosa The resultant diminution in oxygen supply invites bacterial invasion If the stone is in the cystic duct instead of in Hartmann's pouch, pressure on the cystic vessels may shut off the circulation in the gallbladder wall and it is in these cases that gangrene and perforation occur

If there is no great interference with the circu-

<sup>&</sup>lt;sup>1</sup> McGuigan, Walter J Am J Surg. 68 219 (1945)

of spinal anesthesia. Other methods to produce satisfactory relaxation are in daily use. At this time there exists no ideal drug or technic for producing inscasibility. There are imperfections as

well as advantages in every mothod of anesthesia. A certain amount of healthy discontent with the means now at hand provides the proper incentive for seeking new and safer anesthesia.

#### SUDDEN ASPHYXIAL DEATH

Asplyxial death is usually sudden. A boy goes out to swim too soon after a big meal, is seized with "cromps," drowns alone, or if pulled ashore falls to rally. Firemen or police come with a "resuscitation is not necemplished. One sometimes wonders why n physician is not called. Has the public lost confidence in our ability to revive an asphymated person? Of course, the glamor of the police or fire wagon is appealing and spectacular, while the physician must work quietly without fanfare. The mechanical contrivance has saved an occasional life, but it is common medical opinion that it may do more harm than good, because its use is not based on an understanding of the causes of asphyxia, such as a blocking of the lower arrways by a foreign body, or failure of the repliratory center in poliomycluta. In any case, immediate action is called for, but this must be based on a thorough knowledge of the art of resuscitation How many physicians are prepared to carry out all the intricate details of his art?

In 1933 an article was published in the American Journal of Surpey entitled "Asphyxial Death a Professional Diagrace." Out of the interest it aroused the Society for the Provention of Asphyxial Death was incorporated, with its founder, Dr Paluel J Flagg, as president-director. The necessity for research and for the dissemination of knowledge to all physicians, nurses, hospitals, and public health agencies was promptly recognized by most county, state, and other medical societies. The American Medical Association appointed a Committee on Asphyxia in 1937 and every professor of obstetrics who could be found was circularized. Some axty-three medical schools replied, but little came of the new movement. In 1939 it was revived by Surgoon General McIntire when he opened a department of pneumatology at the World's Fair, but the impetus again soon died out chiefly because instructors endered without remuneration. "No funds" was the phrase heard in most hospitals.

The Children's Bureau, in Washington, and the director of maternal and child welfare responded, but again there seemed to have been no funds which could be allotted to this great enterprisa. All forty-eight states were informed of the need fifteen responded. Even today after ten years of effort, many physicians and institutions seem to know little or nothing of either the need or the methods of reviving the applymated. Dr. Flagg is asking some pertinent questions: Of the general practitioner be is inquiring, What treatment do you advocate for the various stages of asphyxnia. Of the nurse, How would you treat a case of asphyxia if left cutively alone with such a problem? Of the bespitals, Whom of your staff would you call as an "expert" in a case of asphyxia in the operating room or in the accident room? What is your routine in carbon monoxide poisoning, electric shock, clemined gas possoning, shock from total submersion asphyxia neonatorium, acute respiratory failure in pollomyeli tas?

What routine is followed in an ear and throat postoperative patient who shows agas of asphynna after being put back to bed? Of medical school officers he would like to know what instruction as given to students if they were called on to revive an arphydiated person, other than the Schafer or the Silvester method? How many can use an electrically lighted laryngoscope or remove a foreign body by direct vision? of firemen and policemen What etages or degrees of asphydic can you mon recognize? Give the treatment you would apply other than mechanical. Impending death from asphydia is of immense importance. Why then is so little known about it among 'general mon? Answer They have never been taught.

In order to raise money to do just this, Dr. Flags has a plan whereby anybody who lost a son in this War may buy a twenty five dollar bond, and offer it or its equivalent to the Society for the Frevention of Asphynial Death to develop a fund, the proceeds from which may be used to instruct doctors, nurses, and other medical personnel in the art of resuestation. Certainly the need is great, we hope the "plan" will work enormous good to a great host of unfortunate persons about to die from asphysia of whatover kind. They can be saved they must be saved. The method is at hand. Only wide distribution of the method is needed, but it will take money to do it.—If Rec. Dec. 1944.

situation obtains for cardiac muscle, which, like the brain, exhibits little tolerance to oxygen want. It has been suggested that certain instances of coronary occlusion occurring many months after operation may be related to an episode of hypotension during the course of the previous anesthesia. If only because we are as yet incompletely aware of all the dangers incurred by a period of artificially induced hypotension, it should be regarded as a potential hazard

A great many evaluations of spinal anesthesia or any other method of anesthesia are based on Most of these reports utilize a wellestablished, fairly uniform method of analysis. that is, a variable number of cases in different age groups undergo one of a series of operations with spinal anesthesia obtained with a specific agent administered in a certain manner Results are tabulated showing the number that recovered, died, or developed pneumonia or bladder disturbances, and so forth These statistics do provide very valuable facts and are still one of the best ways to appraise any therapeutic method But because so many variable factors enter into any such analysis, it is evident that conclusions drawn from them vary and are often diametrically opposite

Without resorting to one of the usual verbal quips about the worth of statistics, this essay has, as previously mentioned, another objective—It is not concerned with the percentage incidence of complications, but rather, by adopting the dictum of safe passage for the patient to the remotest possibility, it is concerned with complications associated with spinal anesthesia, whatever their incidence

Many doctors feel that eliminating the lungs as the site of entrance of the anesthetic agent into the body is a great factor of safety in removing that organ as a nidus for postoperative complica-Conditions predisposing to respiratory tions sequelae are many, and the incomplete ventilation from intercostal paralysis due to high spinal anesthesia is one of them Among other causes are previous condition of the lungs, site of operation, duration of operation, and season of the Respiratory complications occur after operation with or without anesthesia To rely on the premise that there is a significant difference in their frequency when the anesthetic drug is introduced via the subaraclinoid space or via the lungs engenders false security not in accord with recent data

In further criticizing spinal anesthesia, it is necessary to identify those of its sequelae peculiar to it alone, complications which, regardless of their frequency, do not occur when other methods are used

Headache, or "spinal headache," as it has

come to be known, is one complication in this category. There are, broadly, two types. The first, with which the anesthetist is more familiar, is of the annoying variety which is short-hived and clears spontaneously, early during convalescence. A more serious, though fortunately less frequent, type is the one with which the surgeon is more concerned. Such headache persists for long periods well beyond the time after which the patient should ordinarily be completely well. This unfortunate disability, for which there is no adequate treatment, is noted in every surgeon's case records. Any patient so plagued by headache can ably testify to its incapacitating nature.

More distressing than headache are the few instances of bladder paralysis that follow spinal anesthesia. This does not refer to the temporary urmary retention or incontinence that not infrequently may be seen on any surgical ward. But there are occasional episodes of prolonged complete urmary dysfunction, the serious implications of which need no elaboration.

Lumbar puncture may not be an entirely innocuous procedure. It is imputed to be one
causative factor in herination of the nucleus pulposus, resulting in destruction of the spinal intervertebral disk. This diagnosis is being made
with increasing frequency, and when the past
history includes a spinal anesthetic the burden of
proof reverts to it. Purulent meningits and
ascending myelitis have been reported following
spinal tap for diagnosis and anesthesia.

There are several irritative phenomena ascribed to the presence of a local anesthetic drug in the subdural space One such is aseptic meningitis or meningismus, which creates an alarming early postoperative picture Another is sixth cranial nerve palsy Various instances of arachnoiditis are attributed to spinal anesthesia One of these is progressive in nature, causing extensive adhesive constriction of the spinal cord Other nonspecific injuries to the spinal nerves or the coverings of the cord may be the cause for the fairly common incidence of paraesthesias and muscular weakness that patients experience in varying degrees long after they are up and about

Of late, there has been much expressed concern with the neurologic sequelae of spinal anesthesia. Their increased incidence in the literature more likely bespeaks greater awareness than an actual increased occurrence.

The enumerated defects of spinal anesthesia do not automatically spell its doom. But its imperfections must be weighed against the advantage of abdominal relaxation in selecting it or another anesthetic procedure for the individual patient. The benefits of relaxation are only relative and they alone are not cause enough for the popularity

responsibility for providing safe passage. Other characteristics peculiar to epinal anesthesia must be appraised and weighed against the relaxation for which it is hailed. It is the total cost to the patient which must be pendered, and from this in balance must be struck. Here, then, are some of the factors which must be placed on the negative side of the scale.

A patient undergoing operation during epinal anesthesia retains his conscious etate. There are few individuals so stolid that they do not regard surgical treatment upon themselves with considerable apprehension. And to be aware of the nctual procedure, even though insensible to pain, is all too often unnerving. Minutes spent on the uncomfortable operating table without the liberty to change the position of cramped muscles seem interminable and do not favor a placed mental The simple experiment of voluntarily lying on the operating table in the Trendelenberg position for a short interval, even without the prospect of being operated upon, results in intense discomfort. A psychogenic factor in predisposing to surgical shock is n very real thing Much of this may be overcome by the preoperative administration of depressant drugs. adequate sedation too often entails excessive dosage with opiates or barbiturates, which of itself is undesirable. The element of consciousness must be considered a defect of spinal anesthesia, if only because of the prevalent practice of rendering the patient unconscious with some other anesthetio drug during spinal anesthesis.

The technic of spinal anesthesia lacks a certain fineness of control, even in the hands of the skilled and experienced anesthetist. Once instituted, spinal anesthesia cannot be discontinued rapidly, should any untoward incident so demand During such circumstances, the anesthetist can only resort to limited and not completely effective means which minimize the side effects of the procedure but which do not eliminate the anesthesia per se. No one can unequivocally guarantee the extent and duration of spinal anesthesia. These can only be approximated Fortunately, from a practical aspect, the level of anesthesia usually attained is higher rather than lower than that required for a specific operation This tends to minimize the fact that many patients undergo appendectomy with anesthesia extensive enough for cholecystectomy or undergo cholecystectomy with anesthesia extensive enough for thoracoplasty or even thyroidectomy Almost always, the completion of operation does not coincide with the termination of spinal anesthesia, which, of its own accord, "wears off" gradually in the early postoperative period. The reverse is, perbans, the more serious limitation of the method Often, for unpredictable reasons, the surgeon may require more time for the operation than he at first estimated. Furthermore, individual patients show extremely variable time differences in the extent and duration of anesthesia when given identical doses of the same anesthesia when given identical doses of the same anesthetic drug. When this occurs, anesthesia may "wear off" and become inadequate before the operation is nt an end. It is true that new agents, equipment, and the continuous technic have mitigated considerably this lack of control over spinal anesthesia. But these distasteful features of spinal anesthesia, even with new drugs and equipment, still have not been eliminated and must be considered in defect of the method.

The recent war years have seen a tremendous interest and concern with the pathologic physiology of trauma and hemorrhage While much of such knowledge is confusing and is yet to be completely catalogued, many critical impressions have been formulated and strengthened One of the most significant of these is that the body reacts to injury to preserve itself by calling upon certain protective or compensatory physiologic mechanisms. These interrated functions are widespread and mediated via the autonomic It is logical to assume that norvous system anything which interferes with this reflex activity can seriously handicap the surgical patient. Con comitant with the sensory and motor loss, spinal anesthesia results, normally, in sympathetic nervous-system paralysis to the lovel of anesthesia. Spinal anesthesia, therefore, eliminates compensatory sympathetic mechanisms in the anesthetized region For the moment, it is unimportant to identify the exact site of the vascular paralysis—whether it is central, arteriolar, or postartenolar in nature. What is important is the fact that peripheral vasomotor insufficiency Following spinal anesthesia vascular occurs hypotension is frequent, circulation time is greatly prolonged, venous return to the heart is decreased, and cardiac output may full Sympathotic nervous system paralysis and the interference with compensatory vascular activity it en tails must be considered a defect of spinal anesthesia for major surgery

One of these vascular changes, hypotension, ments epecial monton. Of the enterna for cuculator, depression, in fall in blood pressure is perhaps the most readily measured chinically. This occurs with such frequency that many surgeons and anesthetists seem to regard the phenomenon with equanimity and as an integral part rather than in complication of spinal anesthesia. Induced bypotension certainly produces some degree of cerebral anemia and its resultant hypoxia. Lesser degrees of cerebral bypoxia though not immediately apparent, are becoming a growing cause for concern. A comparable

#### IMPERFECTIONS OF SPINAL ANESTHESIA

S G Hershey, M D, New York City

(From the Department of Anesthesia, New York University College of Medicine, and the Division of Anesthesia, Bellevue Hospital)

THEN, in 1885, Corning injected cocaine into the spinal canal, he touched off a controversy which keeps growing with the passing vears It is wholly unlike the century-old debate as to who was the first, successfully, to utilize the anesthetic properties of ether and nitrous oxide, an argument reserved for historians and committee resolutions The controversy over spinal anesthesia is argued daily in operating rooms all over the country Its merits and demerits are hotly disputed by all manner of physicians, by both the leaders and the rank and file The internist has his leanings, so has the neurologist, the surgeon, and the anesthetist eager to present his evidence Convictions are many, converts are few

For the most part, the applications of spinal anesthesia are the daily province of the anesthetist and surgeon working in harmony, and both would certainly agree that it is the patient's welfare that is of paramount importance. Though the doctor's convenience and habits are important, since they ultimately also affect the patient's well-being, they must be considered of secondary significance in any discussion of anesthetic management.

When it is granted that the method of anesthesia is rational only when it is suited to the patient, the case for or against spinal anesthesia may be argued, perhaps, with greater clarity. One cardinal aim of medical anesthesia is to fashion it to each patient's needs, as opposed to the Procrustean attitude of fitting the individual to a fixed pattern of anesthesia. Spinal anesthesia has both its staunch enthusiasts and its bitter critics. No single dissertation can resolve the contention with any finality. However, since "spinal" is a chronic topic for discussion, it might not be amiss to restate some of its deficiencies as one effort to evaluate it

The past two decades have witnessed tremendous strides in the development of the entire field of anesthesia. This progress has exhibited two major trends. First, there has accumulated new knowledge of anesthetic drugs—their actions, their effects on body function in both normal and disordered states, and, most important, the significance of these effects on the integrated activity of the entire human organism. Second, there have occurred an evolution and refinement of anesthetic technics utilizing new principles, drugs, and equipment. One result of this growth has been

that the proficient practice of anesthesia has come to include both this new knowledge and the experience and dexterity required to use modern equipment. A well-trained anesthetist, (and the surgeon should be aware of this) has many ways to make use of this equipment.

Rendering a patient insensitive to pain so that surgical procedures may be completed is essentially adjunctive therapy, that is, anesthesia of itself does not cure but makes treatment possible As such, it might be termed a necessary evil This by no means implies that anesthesia is cast m a disparaging role, for a moment's consideration reveals not only that most of the surgical performance is utterly dependent upon narcosis, but also that much of the present highly developed state of surgical practice stems from the parallel progress in anesthesia However, since pain relief does not heal, it cannot be allowed, within the physician's capabilities, to jeopardize the patient's recovery and well-being, even to the most remote possibility

In contrast, the very nature of surgical treatment for disease or dysfunction implies the assumption of a calculated risk. This fundamental difference in concept is no mean burden for the anesthetist's conscience and allows him but little leeway to wield the potent weapon of anesthesia Come what may, anesthesia, within extremely narrow margins, must guarantee the patient safe passage through the surgical journey This journey starts before the patient enters the operating room and it is not concluded until long after he leaves His doctor must examine and evaluate each part of the trip and guide the patient's course accordingly The cost, to the patient, must be kept uniformly low for the entire passage

One characteristic of spinal anesthesia stands out above all others. The excellent muscular relaxation it affords is its greatest attribute, and not without reason. For the relaxation of spinal anesthesia is the surgeon's joy and renders his task the more feasible. It cannot be denied that this is, at the same time, a valuable service to the patient. Spinal anesthesia, in bringing about a flaccid abdominal wall, is also a great aid to the anesthetist, who thus almost invariably achieves an optimum operative field. In this regard, his task is rendered relatively simple

But securing a well-relaxed abdomen by no means completes the anesthetist's task or his  use is satisfactory only in a relatively small percentage of cases The results of various dosages of the mercurials have been studied by Modell. The use of aminophylline intravenously, followed one hour later by an intravenous mercurial, has been the subject of another investigation."

After a consideration of the xanthine and mercurial diuretics, there still remain a few other medications that may prove of value in an occasional unresponsive case. Urea in large desage, in the absence of advanced renal insufficiency. occasionally proves of value Bismuth-sodium tartrate in a dosage of 30 mg intramuscularly will at times produce a satisfactory and prolonged diuretic effect. The use of posterior pituitary hormone occasionally results in diuresis

Before concluding this discussion, other important mechanisms that serve to disturb water balance must be given hrief attention result of dietary restrictions anorexia, cardiac cachexia, or associated liver or kidney disease the level of serum protein may become depleted. It would be futile to direct treatment solely toward the relief of congestive failure and ignore the more important serum-albumin deficiency Stare and Thorn have called attention to the use of protein as a diuretic agent in the absence of asotemia. Similarly, when the wet type of beriber is the causative factor specific treatment with vitamin B<sub>1</sub> (thuamine) can accomplish a miracle carding complications of myxedema can be relieved only by treatment directed toward the printary cause. An occasional patient who has reached a state of chronic, irreversible heart disease and no longer reacts to usual treatment mays how marked improvement on parenteral vitamin-B complex, 1 cc. combined with 100 mg of thinmine hydrochloride intramuscularly daily. when this is combined with the former meffective treatment. Finally, it has been reported that the addition of magnesium sulfate to the mercurials may enhance their effect. 11

In closing it seems worth while to re-emphasize that a successful outcome in the therapy of cardiac dyspnea depends upon accurate diagnosis and the prompt recognition and treatment of any existing complications, as well as a knowledge of the rela tive importance of rest, sedation, digitalis oxygen, and salt restriction. The assistance that may be derived from acid-forming diets and acid medications, as well as the value of increased potassium intake, has been reviewed. The indications for mercurial diuretics have been emphasized and some reasons for their frequent neglect have been enumerated. The main purpose of this paper has been to encourage the more frequent usage of the mercurials in cardiac dyspnes, for by so doing the attending physician not only prolongs the life and comfort of his patient, but accomplishes in full measure the aims of all true physicians

first thought when ordinary routine treatment fails to relieve congestion. It is commonplace to hear the statement that if the xanthines do not work, then eventually the mercurials will be tried. It is obvious that, facts to the contrary, the power of the mercurials remains unappreciated, while the importance of the xanthines has been considerably exaggerated.

This is only one of the many reasons for the general failure to make full use of the mercurial diuretics A common, unfounded belief is that the frequent use of mercury will cause kidney injury When one considers that full use of this potent drug is made by many, though not all,24 investigators and clinicians in the treatment of nephrosis and the wet stage of chronic nephritis. it is difficult to understand how such a misconception of its toxicity can remain so firmly established As with any other potent medication. certain precautions must be observed instance the presence of an acute nephritis, appreciable numbers of red blood cells in the urine, advanced chronic nephritis with marked renal insufficiency, or the failure to maintain a reasonable twenty-four-hour output (but not necessarily an increase over reasonable pre-existing output) This last consideration is of great importance, for it has been observed that nocturnal dyspnea has ceased to be troublesome, even when no increase in urnary output has appeared following the inlection of the diuretic The presence of albumin and occasional casts, so common in chronic passive congestion of the kidney, need never act to prevent the full use of the drug when the indications for it are present 35 So many authorities could be quoted directly to substantiate these facts that the reader can only be referred to the various articles noted 36-41

There are less important reasons for failure to make full use of mercurial diuretics. It is simpler to give the patient tablets by mouth than to use mjections The reports in the hterature of sudden death following the intravenous use of these substances deter some from more frequent recourse to them 34,42,43 Recently a similar article,44 reviewing mercurial diuresis and sudden death following intravenous injection, has appeared This report carefully summarizes the clinical and laboratory findings in three patients, and covers, presumably, all available material from a large hospital and private practice over a six-year Although the expressed purpose of the paper is to emphasize the danger of intravenous mercurial therapy, the statement is made that "Intravenous injection of mercurials should not be discontinued, but realization of danger of their use must ever be present" Hyman 45 discusses this important problem also and concludes, "The great boon of mercurial diuresis must not be withheld through these unfortunate technical reactions which are independent of the pharmacodynamics of the drug." In a similar vein Salzer has stated, "I fear the articles in question may influence the uncritical or inexperienced in the use of a most valuable drug—a drug which is truly remarkable when used in the proper cases, which by their very nature are inseparably associated with the possibility of sudden death." Many clinicians have had the experience of delaying an intravenous mercurial injection until the following day, only to learn that their patient had died suddenly at some time during this interval

Patients object to intravenous treatment, the spilling of the solution around a vein with resultant discomfort, the development of phlebitis in a frequently used vessel, difficulty in finding a suitable vein, or the occurrence of a rare localized abscess when the solution is given intramusculariv These conditions do not arise when xanthines are used Moreover, some patients, as edema recurs, tend to associate this condition with injection treatment and express the fear they are coming to be entirely dependent upon this medication Occasionally excessive diuresis with marked base and chloride loss results in weakness, prostration, or muscle cramps The financial drain of frequent injections may also act to prevent full cooperation on the part of the patient These statements present a fair cross section of the objections to the introduction and continued use of mercurial injections. It would appear that the relative harmlessness of proper usage of the mercurials cannot be overstressed This opinion seems reasonable, for to withhold this treatment until advanced right-sided failure with swollen lower extremities, engorged liver, ascites, and distended neck veins appear is analogous to withholding diphtheria antitovin until the patient is in extremis because a severe serum reaction has occasionally been reported

The action of the mercurial diuretics, while not completely understood, rests chiefly upon solid This action centers mainly upon the kidney tubules and temporarily inhibits their normal reabsorbing powers. Thus a larger quantity of the glomerular filtrate is available for excretion and the total kidney output is in-These preparations are usually given intravenously in amounts of 1-2 cc after a preliminary test dose of 0.5 cc to determine individual idiosyncracy They should be injected slowly, taking two to three minutes for the procedure Present-day mercurials may be injected deep into the buttocks and rarely cause severe pain or local reaction Suppositories are available and are useful to lengthen the interval between necessary injections Oral mercurial medication is now obtainable, but at present its cruseful to him in twenty years of wide experience. To those who instinctively distrust this drug let me quote. "Patients who suffer from long nights of insomma and from the torment of dyspine and cruses of asthma sleep like children once again after the first nijection or, at most, after the second or third one. Patients who have resisted digitalis rapidly recover under the action of ouabain. Its effect on nocturnal dyspinea in patients with cardine disease is comparable only to that of morphine."

Although the importance of exygen was mentioned above, and its therapeutic value is well recognized, it is occasionally difficult to reach a clean concerning its early usage. It is a clinical opinion that ordinarily the use of exygen is begun twelve hours too late.

After due consideration has been paid to rest, sedation, and some form of digitalis therapy, the importance of sodium restriction logically follows. The idea is prevalent that edema is due to retention of water alone We see patients who ask continuously for more liquid, but are kept on marked fluid restriction Yet there is excellent ovidence that plain water in the absence of base, chiefly sodium, not only will show no prerenal deviation, but that it netually may have a definite diuretle action 11-12 This action results from some of the fixed tissuo base being removed and passed out of the body with increasing urinary volume. Since this base is no longer available to bind water, more fluid is taken into the blood stream and this is added to the total urmary output.

The importance of sodium in binding water to the tissues in the form of a definite soliution. cannot be overemphasized. Occasionally, although table salt is greatly reduced in the diet, the patient uses salted crackers, soups, or pretief as baking sodia, alkaline waters, or some proprietary preparations often high in sodium content, are commonly used by the patient and never brought to the physician's intention. Sodium brounde for sedation is also contraindicated in these cases.

In addition to sodium restriction, its elimination is increased by use of the and forming drugs,
such as ammonium chloride. When this medication is given in sufficient amounts, in the presence
of good liver and kidney function, the ammonia
becomes converted into urea and the remaining
and radicle causes the release of fixed tissue salts,
again chlefly sodium. This action is necessary
to prevent the development of acidosis and to
keep the hydrogan ion concentration normal. It
should be noted that in the presence of marked
renal insufficiency and uremic acidosis the administration of acid forming drugs is contraindicated. Their action can be enhanced by the

use of a diet that results in a high-acid ash in the

Potassum chloride is used occasionally to combat edema. It is well known that alterations of sodium and potassium metabolism are intimately associated with disturbances of water balance and distribution as well as acid base balance." Most observers, 2 although not all, 31 agree that in the diuresis induced by potassium salts sodium is swept out With water binding sodium being eliminated in considerable quantity, it follows that more tissue fluid can be excreted and edema diminished Furthermore, as potassium salt is absorbed into the blood stream, the osmotic pressure of the plasma is increased and available interstatual fluid is transferred rapidly to the The unneeded potassium salts cannot re-enter the blood stream via tubular reabsorption, so they, as well as the water withdrawn from the tissues, are excreted with resultant increased urmary flow 13

It is interesting to speculate that if a control lable state of Addison's disease could be induced in congestive heart failure the excess sodium would present no problem. One of the findings in adrenal cortical insufficiency is that the patient stores potassium but excretes excessive amounts of sodium, with the development of a state of dehydration.

A consideration of the use of diuretics has been left to this point because an appreciation of their importance is paramount from the standpoint of the treatment of cardino dyapnes. The use of xanthines, such as aminophylline, theobromine sodrum acetate, and theocalcin often is valuable in cases of early pulmonary engorgement, but experience teaches that mercurial diuretics more frequently are the solution to this problem. The use of xanthines is time-honored, and they retain their present position mainly because of their priority in this field, as well as their comparative ease of administration. The full story of the action of the xanthines in relieving edema is not entirely known, but certain physiologic actions have been noted, 22 such as (1) an increased giomerular filtration due to the elevation of the intraglomerular pressure, (2) an increase in the number of the functioning glomeruli, (3) decreased tubular absorption, and (4) an increase in the noncolloid constituents in the blood

The use of mercurnal diuretics has grown steadily since their inception, and despite occasional criticism has proved to be one of the great advances in treatment of congestive failure since the general acceptance of digitalis. The great pity is that even today so many patients in despirate need of this therapy are still treated with xanthine medication. The profession has been xanthine-conscious so long that this is the

cardiac disease who suffer a more gradual onset of respiratory discomfort, often evidenced first by short, sudden attacks of nocturnal dyspnea, for whom the present-day physician has a splendid armamentarium at his disposal Frequently these patients first notice insomnia that fails to respond to the usual sedative medications patients, even when sleep can be induced, all too often tell the story that after two or three hours of troubled rest they awaken suddenly, have to sit upright or get up from their bed and pace the floor, but they rarely state that their breathing was difficult More often they attribute their awakening to an unpleasant dream, a sudden street noise, or a full bladder Failure to realize that early pulmonary congestion is the basis of this complaint will delay the introduction of proper therapy until advanced congestive failure is heralded by basal rales or the sudden onset of acute pulmonary edema 11

What, then, are the chief causative factors responsible for this condition? Aside from the acute conditions mentioned above we must concern ourselves mainly with the causes of left ventricular failure Primarily, hypertension with cardiac dilatation and cardiac hypertrophy up to the point of exhaustion of myocardial reserve comes to mind Other causes of left ventricular failure, with gradual pulmonary congestive phenomena, are seen in coronary arteriosclerosis with myocardial insufficiency, aortic stenosis and/or aortic insufficiency, arteriovenous fistula, and congenital lesions such as coarctation of the aorta, subaortic stenosis, and patent ductus arteriosus, a congenital type of arteriovenous Rarely this condition occurs due to a fistula traumatic tear in the anterior cusp of the mitral valve The onset of acute myocardial infarction, accompanied by left ventricular weakness and often peripheral circulatory failure as well, is seen frequently as another condition causing respiratory discomfort

In addition to the primary factors already considered one must not overlook various precipitating causes of heart failure. When these precipitating factors can be eliminated, the outlook for the future is decidedly improved. Acute respiratory infections and frequent nonproductive cough, the sudden onset of rapid heart action, grave emotional strain, marked physical exertion, a previously undetected anemia or avitaminosis, thyrotoxicosis, pregnancy, rapid increase in weight, longstanding overweight, or an unsuspected arteriovenous fistula may act in this capacity.

The rapid advance in treatment of cardiac dyspnea challenges the all-too-busy present-day physician. Unless his primary interest lies in the field of cardiology or he has had sufficient free

time to follow the rapid advances in our literature, the plight of the unfortunate patient remains no better than his predecessor of ten years previously. Unless care is exercised in interpreting the early symptoms expressed by the patient and prompt use is made of all the present-day refinements in treatment, the patient, like the Allies of earlier years, will be offered too little and that little often too late

#### Treatment of Cardiac Dyspnea

Although the aim of successful treatment of cardiac dyspnea is to eliminate pulmonary congestion, there is no feature of the existing cardiac pathology that can be safely ignored Rest for the cardiac patient is at present a topic much under discussion 12-14 The judicious use of various sedatives, morphine, or pantapon by hypodermic for a few nights, often gives the dyspners patient the first real rest he has had for some time and occasionally proves to be the turning point which may alter a previously pessimistic It is only when other important methods of treatment are neglected that the use of narcotics becomes a serious problem Chloral hydrate, 15 sometimes considered contraindicated in cardiac disease, apparently has a large safety factor, and no hesitation concerning its use should

Digitalis today occupies the same pre-eminence that it has held since the work of Withering established its efficacy in the treatment of heart disease 16 The investigations of Eggleston 17 and of Pardee18 as well as of Gold and DeGraff19 served to furnish a definite procedure and a satisfactory means of administering this potent While nausea, vomiting, anorexia, medication yellow vision, and slow pulse are usually mentioned as the cardinal signs of digitalis intoxication, if there is uncertainty regarding its presence,20 one must look for frequent extrasystoles and various electrocardiographic changes as well A gradually rising pulse rate that may tempt the physician to increase the dosage may continue to accelerate until ventricular paroxysmal tachycardia or ventricular fibrillation results in death from digitalis intoxication The indications for the use of digitalis are clearly defined by White 21 Christian's contribution of its value in the treatment of chronic noninflammatory myocardial changes without associated valvular disease finds many followers 22 Today there are several brands of the purified derivative, and the intravenous use of cedilanid in emergencies is routine in certain clinics The use of ouabain (Arnaud preparation) has been carefully described by Chavez 23 He contrasts the action of this preparation with digitalis and summarizes the special cardiac conditions in which it has

#### CARDIAC DYSPNEA AND ITS TREATMENT

MAURICE A DONOVAN, M D, Schenectady, New York (From the Department of Cardiology Ellis Hospital)

RESPIRATORY distress, the common denominator of many serious cardiae ailments, should be well understood by the attending physician Failure to utilize fully the assistance that present-day therapy can render the dyspineir cardiae patient appears to be a prominent defect in the management of congestive heart disease. It has been estimated that at least one third of the patients referred to heart specialists for treatment would not have required such reference if adequate medication for cardiae dyspines had been employed originally <sup>1</sup> It is with this thought in mind that a review of this problem is being undertaken

Before proceeding with the consideration of cardiac dyspnea, it would appear wise to devote some attention to breathlessness of noncardino origin It is obvious that respiratory distress from this source cannot be expected to respond to many of the measures employed to treat cardiac dyspnea Exertional dyspnea is frequently seen when the basal metabolic rate is considerably increased, as in pregnancy, loukemia, hyperthyroidism, and fever The same problem often arises in grossly obese patients. Reduced oxygen in the available air at high elevations, a frequent military aviation problem, or with temporary residence at a high altitude, may result in respiratory symptoms. Any of the causes of acidosis will result in increased stimulation of the respiratory center. Hysterio stigmata are sometimes demonstrated in abnormal respiratory reactions, and certain forms of organic cerebral disease occasionally cause respiratory signs Marked grades of anemia of various types frequently cause pulmonary distress

Various pulmonary diseases, from acuto respiratory infections to lung tumors, as well as mediastinal pathology, are of importance from the standpoint of differential diagnosis. It has been noted that heart disease and asthmatio bronchitis are both prevalent conditions, and that the two findings are frequently present in the same patient. Thus, one must carefully examine the patient and make the proper interpretation of the respiratory problem. Levines gives a clinical picture of some different types of respiratory findings and clearly differentiates cardino from pulmonary signs.

A brief consideration of the pathologic physiology of cardine dyspines will serve to throw further light on this problem. It was noted by observant clinicians over two hundred years ago that pulmonary congestion was probably responsible for cardiac dyspnea 4 The importance of oxygen deficiency or carbon-dioxide excess in the circulating blood and its effect on the action of the respiratory center cannot be demed, but it has been shown that these stimuli are of less importance in cardiac disease than many have supposed As a better understanding of blood chemistry evolved it was natural that the effect of hydrogen ion concentration on the respiratory center and its relation to dyspnes should be investigated While there may be rare instances in which this may result in abnormal breathing in cardiac disease, acidesis more often is of secondary importance and a concomitant of some separate complication . Harrison and his associates have pointed out the importance of nervous reflexes originating in the engorged lungs and mediating their effect by way of the vagus ' It becomes clear that a thorough study of the various physiologio and chemical disturbances is helpful in securing a better understanding of cardiac dyspnes. However, the weight of current opinion upholds the fact that pulmonary engorgement, resulting in definite nervous reflexes being transmitted through the vagus nerve, is the important factor in precipitating respiratory distress in acute and chronic cardiac disease.

These findings are mainly the result of decreased myocardial strength, seen chiefly in left ventricular strain, weakness or failure. The rapid onset of acute diffuse glomerular nephritis may, on occasion, cause paroxysmal dyspnea, due to the secondary hypertension and left ventricular strain. Pulmonary congestion in mitral stenosis, due to a tight mitral valve and not necessarily related to myocardial failure, has been pointed out by White. The sudden onset of rapid heart action as paroxysmal auricular tachycardia nuncular fibrillation, or flutter in a patient with advanced organio heart disease will induce cardiac dyspnea, but failure to institute prompt treatment to control the complication and with treatment directed only toward the original disease will at best achieve only poor results. The major complication of ventricular tachycardia, as whon this occurs following myocardial infarction. must be promptly recognized and promptly controlled with quinldino medication in adequate dosage 3,18

However, it is the larger group of patients with

November, 1943, and had a series of three intra-She remained symptomvenous treatments free until December, 1944 She was referred to Dr Gordon J McCurdy, of Providence, the home town of the patient Dr McCurdy gave three intravenous treatments with good results

#### Case Reports

Case 1 -With the major group of patients there were 4 failures The first of them not benefited was a farmer aged 42 He was given five treatments, but after leaving the hospital the vertigo returned within a week or two, and after a period of eight weeks, it ceased spontaneously Ten years before he had been treated by us, and the attacks continued for about the same length of time

Case 2—The second patient was a man of 38 His attacks covered a period of one and one half years, and he found it impossible to work for almost a year He received two senes of treatments, but his attacks continued He was referred to a neurosurgeon, as there was the possibility of an acoustic tumor being present So far there has been no report from this patient

Case 3 — The third patient was a woman aged 40. on the threshold of the menopause She was in and out of a hospital for twelve weeks with major attacks Four months later she was treated with histamine intravenously Only slight improvement was shown at first, but now the attacks are infrequent and she will have a spontaneous cure

Case 4 — The fourth patient, a woman, aged 47, was in the midst of her menopause. Her sharp attacks of vertigo were so frequent that her career as a teacher seemed at an end She was treated in July, 1943, returned to school in September, and was symptom-free until December, 1943, when she received a series of treatments, and in May, 1944, she was treated again Her attacks in May were not severe, but she had some unsteadiness and complained bitterly of pressure in the head and general pain and It was decided at the time of her last weakness treatment that her menopausal symptoms were overshadowing any symptoms of the syndrome that she might have An attempt was made to convince her of that fact However, on the advice of others, she went to a large clinic in July, 1944 A section of the nght vestibular nerve was performed shown no improvement

Case 5 — The eardrum of one patient presented a The patient, a man of 51, was singular picture treated in July, 1944 He had bilateral nerve deafness but no tinnitus On his first visit to the office the left eardrum was normal in color, but the right eardrum, in his better ear, had a distinct pinkishred hue, not unlike the flush that one observes on some patients under intravenous treatment coloring was more pronounced on the ossicular chain and on the promontory of the eochlea After the first treatment the flush disappeared The patient had noticed no difference of hearing, no fullness in the ear, nor was he ear-conscious His ears have been examined about every three weeks since he left the hospital but both eardrums remain normal in

color The phenomenon just described has not been observed in any of the other patients examined

#### Comment

In appraising a new treatment one must not be led too far afield by apparently good results It is questionable whether any patient ever had his hearing improved by administration of histamme or any other drug used to relieve Mémère's syndrome With every new advance in medicine, we may forget an old truth It is often forgotten that nerve deafness may have an acute catarrhal deafness grafted upon it Then if the catarrhal deafness disappears, the treatment of the moment receives credit for the improvement in hearing One does not have to go farther than arthritis for another specific example Tinnitus is improved in many instances, but again there may be a resurgence, now and then, of head noises In a few cases, for some time following the treatment, there are occasional attacks of vertigo of a few seconds or of a minute or two duration Postural occupation is of importance Farmers, during milking, and card players seem most affected Dandy states that the syndrome lends itself to statistical conclusions That is quite true There can be no doubt that some of the patients reported in this paper as being apparently cured by histamine would have recovered spontaneously, but his statement holds good not only for medical treatment but also for surgical intervention

#### Conclusion

The patient afflicted with Ménière's syndrome is best treated by a private physician rather than by a large clinic where there is a division of responsibility among the personnel He should live within easy call of his doctor, for the therapy is only one step in the alleviation of his symptoms Many of the victims of Mémère's syndrome live in constant fear of recurrent attacks and require assurance from their physicians

If the physician's diagnosis of Ménière's syndrome is correct, he has at hand, in histamine phosphate used intravenously, a treatment that will give prompt relief in the majority of his cases It is a simple treatment, relatively safe, and the only requirement for success is perseverance on the part of both physician and patient

attempts to walk in daylight. When a patient shows no improvement following the efforts of the neurosurgeon or, as often happens, he is made worse, it is not the most propitious moment to state that the patient suffers from hysteria. It would have been wiser to have made that discovery before operation

Many great figures in history have been viotims of Ménière's syndrome among whom was Ludwig van Beethoven. As happens in most instances, the composer's left ear was first affected He was a highly introspective and sensitive young man, and when in 1798 his deafness began to be marked, he guarded it as a guilty secret. Four years later, his deafness increasing he wrote to his hrothers the famous letter known as "Das Heiligenstadt Testament." In it he paints a morhid picture of black despair Reading the tortured pages of "The Testament," one must draw the conclusion that only his ingrained faith in God saved one of the great figures in history from self-destruction It was also in this fateful year of 1802 that a well-known Viennese tenor who was intensely disliked by Beethoven entered his study and the composer, turning suddenly, fell full length upon the floor Fortunately, no bones were broken A fall such as this is not uncommon with Ménière'e syndrome, and it is more than probable that he had had other nttacks. We do know that at times the com poser had an unsteady gut which he was too proud to acknowledge and upon which his friends were too polite to remark. Nerve deafness and tinnitus are both variable symptoms. There were times when Beethoven was much more deaf than at others, and there were times when the roaring in his ears was almost unbearable, end there were days or weeks when it was almost absent. During these periods of quiescence, Beethoven, as is the case with all who suffer from this condition, had a feeling of well-being, or even of exhibitantion. Often in the midst of these periods of euphoria Beethoven wandered in solitude in the Vienna Forest. There he listened to silence that to his rensitive mind was like a song and composed music that seemed an echo from elfinland

Rapid changes of mood end vivid contrast in Beethoven's Symphony No 5 in C Minor express the angulah from which many of the victims of Ménière's syndromo suffer, and it would not be too much to say that out of the symptom complex his created a world of his own During general aneathesia, as the sense of hearing is gradually abolished and, as the patient sinks deeper and deeper into the subconscious world, external noises being obliterated, he hears only the sounds within his own body. He hears the roars of crowds, the pounding of eteel on pavement, the

"sounding sea," the cries of the oppressed, and the "furious blows of Fate" at the door. Similarly sounds such as those were heard by this afflicted and solitary genus, and cast into an imperishable mold.

#### Personal Observations

During the past four and one half years we treated 60 patients with histamine phosphate, the technic of the administration of which is described in a former paper 1 Fifty-three of these patients suffered from major attacks and the results in 49 cases were excellent. Seven patients had what we considered minor attacks of the syndrome. They carried on their usual occupations, but were subject to daily attacks of vertigo of very brief duration. Others had an ever-present feeling of insta-In this group 4 were men and 3 were women Some of the patients said they felt better after treatment, but it is our impression that the treatment had no effect on the condition calling for relief, and that these patients, many of whom show the all too-frequent irascibility of middle life, belong in the hands of the understanding family physician

About 25 per cent of the major cases have a return of symptoms within four eight, or more commonly twelve weeks. Most of these are given a second sense of treatments, and on occaaion a third sense is given.

The procedure followed is to give a series of three intravenous treatments, the second treatment forty-eight hours after the first, end the third, the day following the second The patient has breakfast-before medication Three patients responded badly when the treatment was almost completed They became pale, the pulse was thready, and 2 vomited The needle was withdrawn nt once, and no further treatment was necessary for the complicating reaction those patients who reacted badly the subsequent dose was reduced to thirty drops per minute inetend of the usual fifty or sixty drops per minute None of those patients for whom the succeeding dose was reduced showed any untoward reactions As many of the patients gain considerable weight and are inclined to indulge in rich food, they are put on a bland, soft, nongaseous diet which seems to control some of the side symptoms of which they complain. We no longer use the so-called subcutaneous maintenance dose of histamine phosphate. It has proved to be without value except for its psychologic effect.

In one of our patients a considerable length of time clapsed between the first and the second attacks. This petient was treated in Boston for two years, without relief She had been advised regarding the low sodium regimen and given ammonium chloride. She then came to Troy in

#### TREATMENT OF MÉNIÈRE'S SYNDROME

JOHN J RAINEY, MD, Troy, New York

TO TWO cases of Mémère's syndrome are exactly alike It is a relatively common condition but may be mistaken for something else At first sight the symptom complex, vertigo and tinnitus based on nerve deafness, would seem easy to diagnose However, there are considerable variations in the symptom complex Some natients suffer from brief attacks of vertigo and nausea, while others suffer from constant unsteadiness and other concomitant symptoms, so much so that it is often difficult to decide just where the dividing line lies between the minor and major Moreover, the explosive character of the major attacks, with the patient thrown off balance, the resultant nausea and vomiting, the pallor, the sweating, and above all the terrified expression of the victim make the picture less of a blueprint than one has been led to believe

For example, some patients may suffer from the syndrome for months, and are treated for some condition quite foreign to a disturbance of the ear, such as gallbladder disease or craniocerebral trauma

It is generally agreed that the symptoms of Ménière's syndrome are the result of a local disturbance of the inner ear caused by the release of histamine. It is well established that the intravenous use of histamine phosphate desensitizes the patient and brings about amelioration of the symptom complex. If this remedy had been used early in the treatment of the group of patients just described, it is quite certain that most of them would have had prompt relief

Atkinson<sup>2</sup> believes that the syndrome may be produced by either of two different vascular disturbances, one a primary vasodilation and the other a primary vasoconstriction A histamine skin test is used to determine the type of individual cases His theory is that patients with the syndrome show either a positive reaction and are classed as vasodilator cases, or a negative reaction and are classed as vasoconstrictor cases In the vasodilator cases he generally uses histamine subcutaneously In the vasoconstrictor group he uses nicotinic acid The latter group he considers much more frequent. In our experience we have not found it possible to divide the patients into two groups by intradermal tests with histamine

Lillie, Horton, and Thorwell<sup>3</sup> report that good results have been obtained by the use of histamine or nicotinic acid regardless of the intradermal

Read before the Rutland County Medical Society, Rutland, Vermont, May 15, 1945

tests with histamine One of our patients in whom the intradermal test was negative was also given a subcutaneous injection of 1 cc, 0 275 mg, of histamine phosphate without perceptible reaction. One week later this dose was repeated. At once she went into profound anaphylactic shock that lasted for several hours. Later, she was given intravenous therapy and showed very little reaction other than a slight flushing of the face. After two months there was a return of the symptom complex. She was given three intravenous treatments and has remained well the past four years.

Some patients, during intravenous treatment, show pronounced reactions, while others show little or none. A marked cutaneous flush of the face and neck or even all over the body is not certain evidence that the treatment assures one of success, nor is its absence an indication of failure. With this in mind it would seem rather doubtful that any known test could decide the therapeutic agent to use in Ménière's syndrome.

However, it can be assumed through one's experience with patients suffering from Ménière's syndrome that something is learned of the operative procedures recommended for the relief of this condition Some neurosurgeons claim that about 90 per cent of the patients have unilateral nerve Our experience is just the reverse deafness Less than 20 per cent have unlateral nerve deaf-With this in mind total section of the eighth nerves would be a bold procedure, for the patient's hearing would be destroyed Very few of the patients have total deafness and every physician knows that if we cure one condition, the patient, especially one in middle life, will magnify another No patient is flattered when told that his hearing is of little practical importance to him

Lately, the partial section of the eighth nerve has been employed That is, the vestibular branch is cut through and the cochlear fibers are left intact in order to preserve the hearing There are two serious objections to this proce-As most patients have bilateral nerve dure deafness, it is merely guesswork to section one nerve and leave the other intact Also, if the patient shows no improvement, the operator is faced with the alternative of reoperating to cut more vestibular fibers or operating also on the The neurosurgeon frankly admits other side that a bilateral section of the vestibular nerves may result in complete night blindness and marked "jiggling" of objects when the patient this has not been helpful to such hospitals for the following reasons

"The course of training has been accelerated. meaning more hours in class and study up to the time they become senior Cadet Nurses Then. when they become really useful hands, a large proportion must go to veterans' or other government hospitals for their last arx months Despite the general impression of the students, and others, that hospitals, in getting money from the government, profit financially, the reverse is true The government payment for tuition, uniforms, etc., is merely money which the students formerly paid the hospitals Hospitals get \$15 per month for the first nine months toward maintenance of each Cadet-provided the Cadet does not average more than twenty-four hours of floor duty per week during that period But the hospitals then provide twenty-one more months of maintenance and instruction at their own cost. and then for the last six months must pay from \$30 up, and full maintenance to each student who might be allowed to remain with the hospital for that last period

"To train students there must be a faculty and supervision. There are not the required number of graduate head nurses and others for this purpose. Therefore longer hours are required of

such meager supervisory force

"In all fairness it should be stated that no enterprise or other group has proportionately contributed more people to the armed forces. And it is trained personnel. No one is doing more in supplying trained people such as doctors, nurses, technicans, and others. I venture to say that if all other groups had done proportionately as well we would now have about fifty million in our armed forces.

"It may be true that commercial nurse regis-

tries have too many nurses on their lists, hospital alumnae registries are practically depleted. except for those too old or unable to do other work. It may be that too many sick people ask for specials, and too few doctors feel that they can properly refuse to let them have them It may be that some proprietary hospitals have more than adequate staffs because good husiness makes possible higher wages. Nurses are human. but they haven't disgraced themselves by strikes, as have many other workers. It is entirely wrong to accuse the hospitals which take care of the other 20 per cent of the sick of hearding nurses and thus being unpatriotic. It is also wrong for certain groups to write letters to the essential nurses in such hospitals, telling them they are unpatriotic because they are not in government service. No criticism in these hectle days has been more undeserved "

To this fair statement we may add that it does not go far enough A national registration of all nurses is imperative the data obtained from such registra tion, the public should be informed of the ages, the date of graduation, and the physical capacity of the nurses in civilian hospitals, in industry, and in retirement. There has been too much heat and too little light in current discussion of the nursing situa-tion. The facts can be obtained. The matter is serious and pressing To call for a draft of nurses before the full facts have been made public seems to be merely an admission that the whole nursing problem has been miscalculated and that inequitable solutions are now being urged, such as the nurse draft, to cover up the deficiencies in the procurement program

#### District Branch Meetings

Attention is called to the following announcement of District Branch Meetings of the State Society Details of the programs will be available at a later date and give promise of constituting a valuable substitute for the scientific activities which would have been presented at the regular Annual Meeting

First District Branch—Tuesday, October 30, White Plains (?)
Second District Branch—Wednesday, October 24, U.S. Naval Hospital, St.
Albans

Third District Branch—Thursday, September 20, Albany Fourth District Branch—Friday, September 21, Queensbury Hotel, Glens Falls Fifth District Branch—Tuesday, September 18, Oneida Sixth District Branch—Wednesday, September 28, Country Club, Cortland Seventh District Branch—Thursday, September 27, Clufton Springs Sanitarium

Eighth District Branch-Thursday, October 4, Hotel Statler, Buffalo

and regulations in their employment as regards absenteeism during certain periods, protection against hazards, hours of rest, as well as provisions for the care of the household and for unattended children left at home This has constituted, in many instances, a serious community problem, and brings us up sharply in evaluating woman's status as between being a war worker and a homemaker Thoughtful women have voiced the dangers of these changed conditions in the home from a peace to a war footing Providing shelter, clothing, food, family supervision. and elemental instruction are responsibilities incumbent upon parenthood But right now, the home is 'short' on mother's time, and without it. the American home cannot function adequately If these necessities cannot be supplied, the coming generation will be the sufferer Already the growing incidence of juvenile delinquency has become a major problem "

Dr Kosmak quotes Margaret Craig, of the School Health Bureau of the Metropolitan Life Insurance Company, who claims that the entrance of mothers into the war effort has had

"a deleterious effect on their children and, as she expressed it so well, a "rootless generation" is growing up, especially in the highly urbanized states. She said and very properly 'there seems to be a wholesale rejection of children in lieu of other interests based on the demands of living in a world at war. Where there should be more care and supervision, children are given too much responsibility for their years to carry'"

He calls attention to the necessity for a re-establishment of the home, and comments

"Homes disrupted by influences which should not have prevailed must be restored not from without but from within. The obligations of parenthood cannot be set aside. We are being deluded by the talk of population increase which is based on the bumper crop of babies reported in these recent years. After this, as after other wars, there will come a decline in births, and every child life saved today will have a substantial reflection on our future happiness and prosperity.

"I trust that what I have said will not be interpreted as in any way belittling woman's efforts to place herself on an equal footing with the opposite sex. Her striving is admirable and not to be criticized, if it can be directed along lines which will not take away from her the high esteem in which she is now held as a woman. She is the equal of man in many ways, but it would prove a dull, drab, and weary world if she no longer maintained that position of love and respect and ad-

miration which is her due. Let us hope that some of the sudden transition brought about by the war may not be a permanent one, in so far as it concerns woman's entry into those fields of activity which are foreign to her natural capacities. For, superior to all other and immediate considerations, women must continue as the mothers of the nation. This is their outstanding function and responsibility."

With Dr Kosmak's conclusion we cannot but agree His logic is inescapable. Its effectiveness will be enhanced if it is accepted not by the physicians only, but by the women of the nation. What they will do about it—see Meleager, of Euripides, fragment 525, for a previous warning to these delightful creatures—we do not presume to know.

New York Medicine, commenting on the "catastrophic shortage of nurses," says

"Since the gravity of the situation has brought reassuring words from the Congress that legislation on all subjects brought up by the President in his annual message to that body may be shortly expected, a draft of nurses is highly probable

New York Medicine presents the following statement by one of the city's leading hospital superintendents, which is representative, perhaps, of all voluntary and municipal hospitals

"First When the Army and the Navy say there is a shortage of nurses for our fighters, both abroad and here, something must be done—and promptly—to remedy that situation

"But one of the most unfortunate misstatements of this war, made by both those who should know better and those who do not know anything about it, was that hospitals are hoarding nurses. That statement is certainly not true so far as voluntary and municipal hospitals are concerned.

"Practically all the voluntary hospitals are struggling along with perhaps half the number of graduates for bedside duty that they had three years ago. It is misleading to quote 'nurses per patient' either in Army or civilian hospitals, unless at the same time the types of patients are given

"The situation generally in voluntary hospitals is this Floors have been closed due to lack of graduate nurses, student nurses are placed in full charge of wards and floors for certain shifts, with responsibilities which should not be theirs. Although hospitals with nurse-training schools have greatly increased their enrollment,

#### The Ives-Quinn Bill

The Ives-Quinn Antidiscrimination Act becomes operative in the State of New York on and after July 1, 1045 While primarily directed against unfair employment practices, it is not too much to say that it will be invoked for many other reasons by numerous minority groups. In time, a cumulative mass of decisions under it will create a body of precedent to determine its proper scope and limitations.

In the meaatime, many professional institutions, associations, and groups can anticlipate the probable necessity for making radical changes in their attitudes. Some of them, with no intent to be discriminatory, undoubtedly have followed courses of policy and action which could be considered such if viewed apart from the intent. Others have set up limitations and restrictions concerning acceptability for what may have seemed, in the past, good and valid reasons. The proceedure are made is often slow and cumbercedure are made is often slow and cumber-

some. Many societies have but one meeting a year

Until epecific instances of discrimination by intent are alleged and proved, it would be well to withhold comment. We subscribe heartily to the intent of the antidiscrimination act, but submit that its administration will have to be both painstaking and cau-Many rights are involved, many tlous kinds of institutions and organizations will certainly be accused from a variety of motives, some good, others probably question-Acousations under such an act can have a high nuisance value as well as real Time and much patience will be required to sift the wheat from the chaff, to accomplish which arbitration would seem to offer the greatest possible chance of success

Investigation should be encouraged, and where actual instances of discrimination are found they should be corrected, but a fair and full bearing of all sides is imperative and haste is, of all things, to be avoided.

#### Current Editorial Comment

#### Of This And That

As president of the American Gynecological Society, Dr George W Kosmak took cognizance of the role of women in this changing world, especially with respect to their amployment in industry <sup>1</sup> Said he

"The appeal made through the press, the radio, and the lecture platform is directed to the patriotism of women, it presents the glamorous aspects of wartime service and its attractions are set forth in glowing colors. But one may have doubts of the value of taking women away induscriminately from their previously accepted duties and responsibilities. Less glamorous, perhaps, is the endeavor to enlist women in industries involved in the war effort, industries which had aever employed women, and in occupations formerly closed to them. This concerns not only single but married women. The Bureau of the Census may be quoted as stating that in

March, 1042, there were seven million, six hundred thousand persons in this nation's labor reserve who said they were available for full time employment, of which seven million were women, most of whom were engaged in housework. In November of that year, the reserve had been reduced to five million, of which four and a half million were women, most of them married These figures indicate that approximately two and a half million women were employed in war industries, or other related activities during the intervening eight months. Today, their numbers undoubtedly are greater "

Out of this employment of women has arison a number of social and other problems which Dr Kosmak views with misgivings

"The physical strains imposed on women workers have necessitated more stringent rules

<sup>2</sup> Presidential Address, June 19 1944.

sers Wagner, Murray, and Dingell have not consulted the AMA on matters of such importance to the medical future of this country, to the lives and health of its

citizens, we do not feel that when this fact becomes known the people will have much confidence in the legislation After all, who but the doctors can make it work?

#### District Branch Meetings

There has been some question in the minds of physicians in the State whether the District Branch meetings would be held as usual this year Postponement of the Annual Meeting and the House of Delegates session because of war conditions has caused many to wonder whether the District Branch meetings would also be postponed or canceled This is not so On the contrary, because of the cancellations interest seems to be greater than ever in the programs of the district branches

Dr Robert R Hannon, Executive Officer of the Medical Society of the State of New York, says in a letter

"At a meeting of the executive committee and presidents of the component county societies of the Third District Branch, held in Albany at the DeWitt Clinton Hotel on Wednesday, May 23, 1945, Dr Frederic W Holcomb discussed the importance of District Branch meetings

"Some of the points that had been brought out in regard to District Branch meetings were that in the early period of the State Society, when travel was more difficult and there were not so many scientific meetings, these District Branch meetings were important in bringing scientific articles to members of the profession who would not be able to attend scientific meetings at great distances from their homes It was thought by some that times have changed so much that there is no longer need for holding It was thought that in view these meetings of the ease of travel and the very large number of mportant scientific meetings that a physician could and did attend each year, these not only filled the place of the former District Branch meetings but made them less attractive and less important "

It is of interest to note that at least for this war year the District Branch meetings fulfill the purpose for which they were originally founded, namely, to overcome difficulties of distant travel and a lack of exchange of scientific ideas Publications, too, have been somewhat restricted, but perhaps due to the large volume of printed matter ordinarily reaching the medical profession, some shrinkage in quantity might pass unobserved by many during the war period

But that there is much value in the District Branch meetings is not open to question This year, they will afford the only opportunity for the officers of the State Society to come in personal contact with groups of doctors throughout the State For this and other equally obvious reasons it is hoped that there will be a large attendance Much time and thought is being spent by the officers of the branches and by the Executive Officer to make the programs of the widest possible interest. There is definitely no demand for change in the procedure of the meetings Dr Hannon writes us, following lengthy discussion on May 9, 1945, by the presidents of the district branches in New York City,

"At no time have I found anyone anxious to abolish the District Branch meetings or to turn them into purely Society business meetings or social meetings at this time. Suggestions that had been received along this line seemed to have diminished both in number and in intensity."

We confess to a feeling of considerable satisfaction that the membership of the State Society definitely wishes to preserve intact a valuable custom and heritage of its early years. The present war emergency shows how tenuous are some of our more recent and more elaborate practices based upon modern facilities. There is much to be said for a return, even for a short period, to the primitive customs of our ancestors and the founders of our institutions. They builded solidly and enduringly, and nowhere with more foresight, as the event proves, than the District Branches

state-administered projects. The J A M A continues

"The section of greatest interest to the medical profession at this time is section 9, which would establish a national sickness-insurance system. The proponents of the measure minimize its compulsory aspect in every way they possibly can Nowhere is the word compulsory used In both the abstract of the measure and in Senstor Wagner's presentation all the emphasis is placed on the benefits which presumably every one in the United States would receive from this measure. Senator Wagner reaffirms that complete freedom is offered to every one with regard to such medical services as he may give or re-Indeed, Senator Wagner went so far as to say that health insurance is not socialized medicine, it is not state medicine. With this pronouncement most people with any understanding of the situation will differ They will maist that compulsory sickness insurance with federal control is both socialized medicine and state medicine Health insurance, or actually sickness insurance, is a method of paying medical costs in advance and of distributing such costs There are differences between various forms of sickness insurance. Senator Wegner emphasizes freedom of medical practice, which be says is carefully safeguarded because each insured person is entitled to choose his own doctor But he must choose his own doctor from among the physicians or groups of physicians in the community who agree to go into the insurance system. Certainly the insured person cannot secure the application of any of the funds that be has paid for the payment of a physician who is outside the system. The statement is made that the participating doctors are likewise free to choose the method through which they are to be paid from the insurance fund. As a rule, they must choose as a group either a fee-for-service plan with a fee table, a capitation fee, or a salary In the summary of the bill released hy Senator Wegner the statement is made that the Surgeon General of the U.S Public Health Service-a doctor-would administer the technical and professional aspects of the program sion of the Wagner-Murray-Dingell bill places tremendous authority in the hands of the Surgeon General, as was placed by previous versions. This time there is to be a National Advisory Medical Policy Council, to be appointed from panels of names submitted by professional and other organizations concerned with medical services, education, and bospitals and to include also a representative of the public. This council is wholly advisory and without authority Incidentally, there is nothing in previous law that says the Surgeon General of the U.S Public Health Service must be a physician. The Presi dent can appoint the Surgeon General hy selecting any of the members of the regular corps, which includes physicians, sanitarians, economists, doctors of public health, and a wide variety of other personnel in the field of medicane.

The new bill seems to us to be just as arbitrary, fully as dangerous, and far more expensive than previous versions. We do not believe that it would be acceptable to the membership of the Medical Society of the State of New York either as physicians whom it would regiment or as citizens whom it would bankrupt.

"Senator Wagner points out that he has consulted this time with the American Federation of Labor, the Congress of Industrial Organizations, the Physicians' Forum, the Committee of Physicians for Improvement of Medical Care, and the National Lawyers' Guild, among other organizations, in obtaining suggestions for modifications of his previous version He has not consulted with the American Medical Association or, ns far as as known, with any of the members of its representative bodies or councils. The so-called Physicians' Forum is n group of several hundred physicians, mostly inclined toward communium and practically all living in New York City The Committee of Physicians for the Improvement of Medical Care, once known ns the Committee of 400, now maintains a mailing list of around one thousand physicians and is actually controlled by an inner group of a few physicians who do not in any way represent a majority of medical opinion Thus the hill completely disregards the majority opinion of the one bundred and twenty five thousand physicians who constitute the American Medical Association and who provide the major portion of medical practice for the people of the United States The bill also disregards the sixtythousand physicians now in the armed forces who have sacrificed as much as any other group in the country in the great war in which our nation is now engaged "

We sincerely believe in the common sense of the American people. They can smell a rat as well as or better and quicker than most. They know what they can afford because, after all, it is their earnings which are affected by such legislation, their futures which are being mortgaged, and their doctors, their medically educated sons and daughters who face regimentation. If Mes-

#### That Bill Is In Again—II

Of the medical and hospital provisions of the new Wagner-Murray-Dingell bill. the  $J A M A^{1}$  says, in part

"The Wagner-Murray-Dingell measure-1945 version—would take over the proposals of the Hill-Burton bill for hospital and healthcente: construction and make of it a ten-year program at ten times the cost This is longterm planning with a vengeance, in view of the experimental character of the proposal, at best Instead of the advisory board with authority proposed by the Hill-Burton measure, the 1945 Wagner-Murray-Dingell bill would substitute a National Advisory Hospital Construction Council, appointed by the Surgeon General and without authority, except to review applications and make recommendations

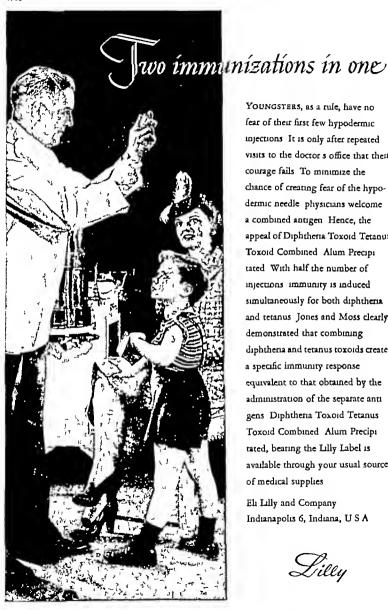

"The new bill also proposes to extend the grants for venereal disease and for the tuberculosis program The section on public-health service would change the present authorization of \$20,000,000 a year for grants to the states with an authorization to appropriate a sum sufficient to carry out the purposes The annual

<sup>1</sup> Vol. 128, No 5, June 2, 1945

amount available to the Surgeon General of the Public Health Service for demonstrations, training of personnel, and administrative expenses is increased from \$3,000,000 to \$5,000,000 a year A formula is established designed to give more aid to the poor states and relatively less to the richer states

"Another section of the 1945 version relates to federal cooperation with the states in providing health and welfare services for mothers and children The states are to develop their own plans, which are to be approved by the chief of the Children's Bureau Here also a formula is established for aiding the poorer states to a greater extent than the larger ones

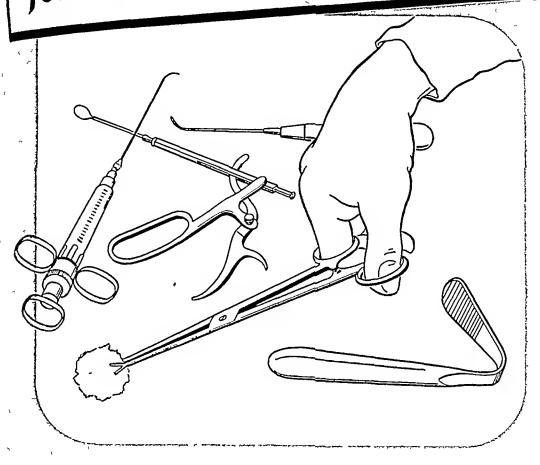

That there is need for reasonable expansion of the above services few will question As to the method here proposed there is growing uneasiness The system of Federal subsidy of state programs is expanding to dangerous proportions, in the opinion of many Such programs as the EMIC have served to disclose the arbitrary nature of remote control in federally subsidized and

YOUNGSTERS, as a rule, have no fear of their first few hypodermic injections. It is only after repeated visits to the doctor's office that their courage fails To minimize the chance of creating fear of the hypodermic needle physicians welcome a combined antigen Hence, the appeal of Diphthena Toxoid Tetanus Toxoid Combined Alum Precipi tated. With half the number of injections immunity is induced simultaneously for both diphthena and tetanus Jones and Moss clearly demonstrated that combining diphthena and tetanus toxoids creates a specific immunity response equivalent to that obtained by the administration of the separate antigens Diphthena Toxoid Tetanus Toxoid Combined Alum Precipi tated, bearing the Lilly Label is available through your usual source of medical supplies

WILLIAM S RICE, Inc., (Lock Box 101), ADAMS, NEW YORK BRANCH SUPPLY AND FITTING OFFICES
BUFFALO, N Y—ROCHESTER, N Y—PITTSBURGH, PA

Before Copperin appeared, massive iron doses were inflicted on the anemic. Most of the iron was not utilized. The excess, excreted fecally, produced gastrointestinal irritation and upset—thus defeating the original purpose of the clinician.

Copperin represents a scientific conception of iron needs in secondary anemia. The iron content per capsule is small — 32 mgm. — but wholly adequate. The potent catalytic agent, copper sulphate, makes ALL the iron

available for regenerative processes.

There is rapid replacement of hemoglobin and new red cells. This is markedly manifested in treating the hypochromic anemia of children; the "milk anemia" of infants; hemorrhagic anemia following blood donation; pregnancy anemia; chlorosis and anemia of middle aged women.

In two strengths: Copperin "A" for adults; Copperin "B" for children.

COPPERIN

WATER-SOLUBLE

NON-CONSTIPATING

temperature of 105 F, and observable was discontinued. The temperature promptly returned to normal and remained so until the patient was dis-

charged on August 11, 1944.

On discharge the patient had complete ptens of the left lid, and aside from slight downward rotation of the eye, his left eye remained fixed and immobile The left pupil was still small and did not react Vision in this cyo was only moderately impaired. His reflexes were normal. His lungs were clear His heart sounds were strong and of good quality His blood pressure was 110/70. His electrocardiogram had returned to normal limits.

Three months after discharge from the hespital, the patient had recovered complete function of his left eve

#### Comment

There were several interesting features observed in this case. The time interval between the recovery from the original furtunels of the lip and left nostril and the onset of the present illness was approximately two weeks, during which time the patient was in excellent health. This is rather unusual and can be explained only by the probability of the presence of a intent thrombophicbitis in the left inferior ophthalmic vein which suddenly flared up and extended into the left exercises sinuscausing a fullminating ascending infection.

The total dosage of pencillin reached almost 6,000,000 units. It was continued in fairly large doses for two weeks after the temperature had reached normal. This might be deemed extravagant therapy, but in view of the extreme latency of this infection it was considered advisable to err on the side of overtreatment rather than to risk an exacer

hation of the infection

Touc myocarditis with congestive failure in a previously normal beart occurred. Sensitivity to suifathlazole developed after it had been discontinued for two weeks. It will be recalled that the patient also received suifathlazole for the troatment of his original facul cellulitis.

Repeated blood cultures were negative, and the causative organism will always remain speculative However, if it is reasonable to ascribe the original furuncle on the lip and face as the precipitating factor, it may be justifiable to consider the staphylocecus as the most likely causative organism.

#### Conclusions

It would seem, from the history of this case that infections about the face lips, and nose etc., are not without danger oven after they are apparently healed.

A vigorous course of chemotherapy should be followed in all such infections for several days

after they have apparently subsided

Once caveroous sinus thrombosis has developed, pentullin should be given in adequate doses during the acute course and for a considerable safe period during convalescence to insure against exacerbations.

An example of this was shown recently in a care cited by Nicholson and Anderson (J A.M. A. 126 No. 1) in which penicillin was discontinued twenty four hours after the patient's temperature had returned to normal, following which there was a exacerbation of the infection which was subsequently controlled by penicillin. The patient in this case developed optic atrophy with total loss of vision in his right eye.

### PSYCHOSOMATIC RELATIONSHIP OF EMOTIONAL FACTORS IN CORONARY SCIEROSIS

DOMINICK A BARBARA, M D, Central Islip, New York (From the Central Islip State Hospital)

IT HAS been fairly well substantiated that such disorders as cardiac neurous are psychogenio in origin and that psychotherapy is essential in their treatment. However, the relationship of psychic to a smatle factors in organio cardiovascular disease as subject of much controversy and discussion. A troe value of the importance of either factor can be obtained only through a psychosomatic approach to the problem. Dunbar in her excellent review of the literature in Emotions and Bodily Changes offers notable contributions in this connection.

Only further studies can predict whether con tinued emotional stress can produce organic changes in the cardiovascular system. Weiss and English, in their book, Psychosomatic Medicine,<sup>2</sup> stati. "The neurotic patient who has organic heart disease may add a real hurden to the work of his heart either through constant tension of psychlo origin or more especially, by means of acute epseodes of emotional origin. This may hasten a cardiac break

down which might be indefinitely postponed if there were no psychic stress.' Thus we discover that emotional factors may be of greater importance than the somatic in bringing about a structural disturbance

Recent Rozenbach studies by Kemple' on the personality traits of patients with coronary disease manifested a persistent pattern of aggreedveness and drive to dominate and usually great ambitton with compulsive striving for power and prestige Introversive experience of creative thought is underdoveloped, making them more dependent than most people upon external achievement for satisfaction and security. Patients with coronary disease are reactive and frequently quite extratensive displaying a good deal of hostility.

#### Case Report

Onset of Symptoms.—The patient, a 33-year-old married Russian-Jewish lawyer, about three months

The case reported organism is pathogenic to man in this paper would indicate that abdominal symptomatology may be due to infestation with Giardia

This case is of special interest, however, because of its occurrence in a young woman defense worker who was living in Brooklyn and had not been south She had been working for two years in a shippard where ships from all over the world were repaired It is not at all unlikely that her infection was contracted from a sailor who had brought it in from a foreign country Undoubtedly the cafeteria which she frequented could have provided an excellent reservoir for Giardia

In any event, this ease is noteworthy in presenting an abdominal syndrome which prompted the staffs of two hospitals to request consent for immediate Certainly this case would suggest that operation Giardia intestinalis should be considered in the evaluation of a typical abdominal symptomatology In addition, it is not altogether recondite that World War II may increase the number of this parasite in the United States

Case Report

The patient was a divorceé, age 29 She had enjoyed good health until August, 1944, when she experienced vague abdominal pain, mild diarrhea, and chilly sensations Previously there had been a slight tendency to constipation On September 2, 1944, she passed innumerable loose, watery bowel movements attended by severe colic. The frequency of stool abated and the abdominal pain became unbearable. Her temperature was 102 F She was extremely ill and was admitted to a Brooklyn hospital She remained there two hours and left after refusing to sign consent for immediate

Later that day abdominal pain was so operation severe that she entered another hospital There again she refused to be operated upon and signed She then placed herself under a physiherself out cian's care and was informed that x-rays disclosed "ulcers and colitis" After treatment there was little improvement in her condition Epigastric cramps and diarrhea recurred frequently possibility of surgery was discussed

On December 18, 1944, the patient consulted me In view of the history of having at my office worked in a shippard for two years I sent her stool to the Tropical Disease Diagnostic Service of the Department of Health Giardia lamblia cysts were reported Dr H G Shookhoff wrote, "I understand she has had various abdominal symptoms Such symptoms occasionally arise with the parasite found "

Atabrine, 0 1 Gm three times a day for five days, The patient made a spectacular was prescribed recovery On January 15, 1945, and March 26, 1945, her stool was found to be negative for Giardia recovery lamblia A gastrointestinal series on January 31, 1945, was normal Various laboratory tests, including complete blood count, urine analysis, blood Wassermann, Widal, Brucella, paratyphoid A and B, typhus, stool for enteric organisms, and gastric analysis were negative

Though giardiasis may be unaecompanied by abdominal symptoms, Hartman and Kyser1 found diarrhea present in 60 per cent and abdominal pain in 65 per cent of their series of 100 cases quency certainly was more than coincidence In 35 cases treated with atabrine, follow-up disclosed successful elimination of the parasite and cessation of abdominal complaints in all but one case

### FALL REFRESHER COURSE IN OTORHINOLARYNGOLOGY AT UNIVERSITY OF ILLINOIS

The University of Illinois College of Medicine announces its sixth semiannual refresher course in laryngology, rhinology, and otology, September 24 through September 29, 1945, at the College, in Chi-The course is intensive and largely didactic, but some clinical instruction is also provided

It is especially suited to specialists unable to devote a longer period for advanced instruction and to others seeking a comprehensive review of the field of otorhinolaryngology The number of regis-

It is therefore desirable to trants will be limited apply for registration immediately The fee 18 \$50

When applying, give full details as to school and year of graduation, postgraduate training, college degrees, etc Write to Dr A R Hollender, Chairman, Refresher Course Committee, Department of Otolaryngology, University of Illinois College of Medicine, 1853 West Polk Street, Chicago 12 Ilhnois

### TAKING THE COUNT

There had been an epidemic of influenza in the town, and one physician who had had scarcely any sleep for a week called upon a patient who was suffering from pneumonia "Begin counting," directed the doctor as he

leaned over to hear the patient's respiration

The doctor was so fatigued that he fell asleep with his head on the sick man's chest

It seemed but a minute when he awoke suddenly to hear the patient still counting

"Ten thousand and twenty-six, ten thousand and "-Clin Wed , May, 1945 twenty-seven

J 4 M A 116 2835 Hartman, H R, and Kyser, F A (1941)

temperature of 105 F., and ohemotherapy was discontinued. The temperature promptly returned to normal and remained so until the patient was dis-

charged on August 11 1944

On discharge the patient had complete ptosis of the left lid, and askio from slight downward rotation of the eye his loft eye remained fixed and mmohile The left pupil was still small and did not react Vision in this eye was only moderately impaired. His reflexes were normal His lungs were clear His heart sounds were strong and of good quality. His blood presure was 110/70 His electrocardiogram had returned to normal limits.

Three months after discharge from the hospital the patient had recovered complete function of his left eye

#### Comment

There were a veral interesting features observed in this case. The time interval between the necevery from the original furuncle of the lip and loft nostril and the onset of the present illness was approximately two weeks during which time the patient was in excellent health. This is rather unusual and can be explained only by the probability of the presence of a latent thrombophichitis in the left inferior ophthalmic voin which suddenly flared up and extended into the left exvernous same, causing in fluidinating ascending infection.

The total dosage of penicillin reached almost 6,000,000 units. It was continued in fairly large doces for two weeks after the temperature had reached normal. This might be deemed extravagant therapy but in view of the oxtreme latency of this infection it was considered advisable to err on the side of overtreatment rather than to risk an oxacer-

batlon of the infection

Touc myocarditis with congestive failure in a praviously normal heart occurred. Sensitivity to sulfathiasole developed after it had been discontinued for two weeks. It will be recalled that the patient also received sulfathiasole for the treatment of his original facial cellulitis

Repeated blood cultures were negative, and the causative organism will always remain speculative. However, if it is reasonable to ascribe the original furuncle on the lip and face as the precipitating factor, it may be justifiable to consider the staphylococcus as the most likely causative organism

#### Conclusions

It would seem, from the history of this cose, that infections about the face lips and nose etc., are not without danger, even after they are apparently healed.

A vigorous course of chemotherapy should be followed in all such infections for several days

after they have apparently subsided

Once cavernous sinus thrombosis has developed pealeillin should be given in adequate doses during the acute course and for a considerable safe period during convalencence to insure against exacerbations.

An example of this was shown recently in a case cited by Nicholson and Anderson (JAMA) 120 \ o 1) in which ponicillin was discontinued twenty four hours after the patients temperature had returned to normal, following which there was an exacontation of the infection which was subsequently controlled by penicillin. The patient in this case developed optic atrophy with total loss of vision in his right ex-

### PSYCHOSOMATIC RELATIONSHIP OF EMOTIONAL FACTORS IN CORONARY SCLEROSIS

DOMINICK A BARBARA, M.D., Central Islip, New York

(From the Central Islip State Hospital)

TT HAS been fairly well substantlated that such disorders as cardiac neurosis are psychogene in origin and that psychotherapy is essential in their trastment. However the relationship of psychic to somatic factors in organic cardiovascular disease is a subject of much controversy and discussion. A true value of the importance of either factor can be obtained only through a psychosomatic approach to the problem. Dunhar in her excellent review of the literature in Emotions and Bodily Changes, offers notable contrabutions in this connection

Only further studies can predict whether continued emotional stress can produce organic changes in the cardiovascular system. Wers and English in their book, Psychotomotic Medicane, state. The neurotic patient who has organic heart disease may add a real hurden to the work of his heart either through constant tension of psychic origin or more especially, by means of acute episodes of emotional origin. This may hasten a cardiac break-

down which might be indefinitely postponed if there were no psychic stress." Thus we discover that emotional factors may be of greater importance than the somatle in bringing about a structural disturbance.

Recent Rorschach studies by Kemple\* on the personality truits of patients with coronary disease manifested a persentent puttern of aggressiveness and drive to dominate and usually great ambition with compulsive striving for power and prestige. Introversive experience of creative thought is underdeveloped making them more dependent than most people upon extornal achievement for actisfaction and security. Patients with coronary addresses are reactive and frequently quite extratential size of the product of the pr

Case Report

Onset of Symptoma.—The patient in "" married Russian-Jewish lawver, abo

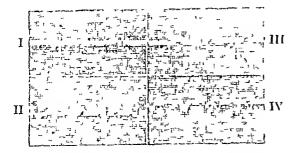

Fig 1 February 28, 1945—Low voltage of the QR-S complexes in all leads and coved and inverted T waves in leads 1 and IV, indicating a myocardial infarction on the left anterior aspect of the heart

before examination had a sudden attack of epigastric and substernal pain radiating down his left arm. A physician was called and diagnosed the case as an acute attack of cholecystitis, and a sedative was administered. The pains increased in intensity throughout the night until a second physician was summoned. He in turn referred the patient to a cardiologist. Electrocardiograms were performed and the patient was found to be suffering from an anterior-wall my ocardial infarction (Fig. 1)

At this time the patient was apprehensive and tense and stated that after the sudden death of his eldest brother six months ago he had experienced the following symptoms typical of an anxiety attack feelings of distress, constant fear of a heart attack and sudden death, cardine palpitation, mental fatigue, frequent urination, breathlessness on slight exertion, and a general feeling of tension and inability to relax. He was examined at that time by a number of physicians who discovered no physicial disturbances of any demonstrable nature. Electrocardiograms\* performed during this period presented no definite evidence of cardiovascular disease. The patient continued to worry about his condition until his anxiety became of such in intensity as to precipitate an attack of coronary occlusion.

Neurotic Character Structure Development —The family on both sides was of Russian-Jewish descent, middle class. He was the second youngest of six siblings. Two of the brothers are at present in state hospitals suffering from schizophrenia. Both parents were described as being simple, honest, vigorous, tolerant, and religious. The mother was pictured as the dependent element in the family, and was the greatest support to the patient. The father had little time to spend with his children, lie dominated the patient and disciplined his mode of behavior. In spite of this, the patient was extremely affectionate toward the father and attempted to win him over on every occasion.

Nothing is known concerning his gestation, birth, or infancy. In his early childhood he was seclusive, shy, and never seemed at ease with the rest of the children in the neighborhood. At an early age he was subject to temper tantrums and nightmares of a frightening nature. His eldest brother was his constant compamon and the one in whom he confided and whom he respected.

Economic conditions grew considerably worse at home, and when the patient completed high school.

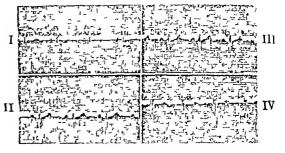

Fig 2 March 30, 1945—Electrocardiogram showed a heart rate of 75 per minute. Sinus rhy thin present throughout. The voltage of the QR-S complexes in the three standard leads was still rather low but of somewhat greater amplitude than previously, but the T waves in leads I and IV were upright and practically normal.

his father decided that he should discontinue his studies in order to help toward the support of the This caused a tremendous sense of rejection and resentment on the part of the patient However, sacrifices were made and, with the additional help of his brother, he was able to continue through Under these existing conditions, the lau school next four years of the patient's life were a most struggling and difficult experience, which gave rise to much aggression and resentment toward his environment as a whole He developed a great urge to work and moved at a vigorous pace He was now going to show his father what a success he could make of himself Before examinations he was prone to worry at length about insignificant matter and had to be exact in his conclusions He would become fearful and tense and would experience "an empty feeling in the pit of the stomach" When the commination was completed, he felt once more at ease and would then decide to forget all about whatever had happened previously

Upon receiving his law degree, he married and was content to separate from his family setting An attempt to practice law was given up after a few months because of a fear of competition and lack of He worned at length about this, but security through the advice and stimulation of his wife, he secured employment in a defense industry as an aircraft inspector The emotional pressure of this new environment increased all the more his anxiety and tension In spite of earning a comfortable wage, he worked at night with whatever law business he could obtain. He felt that with this extra income he could offer his family those commodities which had been denied him during his struggling existence He began to smoke incessantly and would take an occasional drink. He had difficulty in sleeping and felt that his wife was constantly annoying him with her persistent questioning as to his underlying Throughout this entire period he had difficulties the habit of keeping himself under control and re-

pressing his feelings

With the death of his brother, the patient expressed enormous grief. He now began to feel that perhaps his life was governed by some mysterious fate which brought about continual misfortune to his family. His parents' responsibilities, which at one time were centered about this brother, were now to be shifted to him. He brooded over this problem for about six months, as previously stated, until he was stricken with an attack of coronary occlusion.

<sup>\*</sup> The writer regrets to state that these tracings cannot be located

#### Summary

The patient's early infancy, environment, and parent relationship were choracterized by economic stress and lack of warmtin and affection. A hans for unxiety thus set in, with the formation of neurotic trends toward the lack of security and happiness He was compelled to create false personality goals as a means of compensating this constant state of uncertainty His focal conflict centered about a rivalry with the authoritative father and a morbid dependency on the mother His life experiences gave use to a good deal of aggression and recentment, particularly bus family's poverty and the death of the brother with the region of the he had developed, he was unable to measure his true potentialities, which made him weak and insecure llis dependency on othors for advice stimulation and gratitude conflicted with his compulsive need for independence and freedom. His neurotic drives to become perfect powerful and unique in order to compensate for his sense of inferiority made it im possible for him to conform to the normal expectations and standards of interpersonal relationships These conflicting trends create a tremendous anxiety which continually moves about in a vicious circle. His two defeated ottempts to lead an independent existence first in his practice and then in a more secure position as an aircraft inspector, increase all the more his rage and boatility which are being

constantly repressed

In the final store of this listory, the tremundous psychic shock sustained after his brother's death rendered the atuation hopeless until an attack of

coronary occlusion was precipitated

Soon after the patient was informed of lds candac condition, he entored into a sudden stoto of deproceion, became fearful and tense cried easily and assumed a hopeless ottitude toward his his lit was at this point that his wife contacted me for psychi atric consultation

Since this is merely a case report and not a manuscript on therapy, a briof but concise form of

treotment will be presented.

In cases of this type before any mental contact can begin, a state of confidence between physician and patient must be established. The physician must be someone whom the patient can confide in and trust. He must be kind, understanding, sympathetic, and must use caution not to project his own emotions or past hostilities. A preliminary study of the individual s present personality traits behavior, and attitude toward others must be obtained from his immediate family Problems can theo be brought to discussion with the thought of solving them with a human understanding in mind He must be shown that because of his rigid per

sonality he was unable to conform to the normal expectations and standards of Interpersonal relu-These basic factors of dependency must tionship be dissolved and the individual must be ted along the lines of a responsible and independent existence. His mairotic drives are to be replaced by a desire to be genuiou and sincer. He must recognize the underlying auxlety responsible for his condition and eventually come to an understanding of the under tying structure responsible for it. In conclusion the individual's cuttin personality must be reconstructed so that he may better lumself in human relation ships

In this particular case the patient began to show some signs of improvement immediately after a few psychotherapeutic sosions held at his home began to express himself freely and showed a smeere desire to overcome his difficulties. His anxiety lessened in Intensity and he appeared to be well on

the way to a bealthy existence

A second electrocardio ram taken six weeks later presented a remarkable recovery in his cardiac condition as stated from the cardiologist's report, voltage of the QR-S complexes in the three standard leads was of greater amplitude than proviously and the T waves in leads I and IV were upright and practically normal (Fig. 2)

The writer does not wish to miply here that n complete reconstruction of this individual a neurotic character structure has descloped in so short a time but that the anxiety symptom has been relieved to some extent as shown in the patient's decreased state of tension and in the electrocardiographic A thorough cure can come obout only through a p-vehoanalytic approach

#### Discussion

The writer has attempted to present in brief form a case report of anxiety neurosis in relationship to coronari occlusion. No attempt has been made to dispute the concept of whether emotional or somatic factors ploy the greatest role in such a disease. It is only hoped in conclusion that a psychosomalic approach to such an obscure disease as coronary scleroeds be undertaken in the future, with the object in mind of evaluating both physical and pey chologic foctors in the study of illness

#### GIARDIASIS IN A SHIPYARD WORKER

EDGAR LEON DITTLER, M D , New York City

(From the Department of Medicine New 1 ork Medical College)

LIARDIA lambha is found in countries having diverse climates. Although more frequently encountered in the tropics lts presence in the

United States is by no oreans exceptional Stool examination has disclosed this flagellate none too rarely The only question has been whother thus

The writer wishes to acknowledge the assistance of Dr Meyer Sclar Brooklyn New York for his exact taking and reading of the electrocardiagrams.

The case reported organism is pathogenic to man in this paper would indicate that abdominal symptomatology may he due to infestation with Giardia

This case is of special interest, however, because of its occurrence in a young woman defense worker who was hving in Brooklyn and had not been south She had heen working for two years in a shippard where ships from all over the world were repaired It is not at all unlikely that her infection was contracted from a sailor who had brought it in from a foreign country Undoubtedly the cafeteria which she frequented could have provided an excellent reservoir for Giardia

In any event, this case is noteworthy in presenting an abdominal syndrome which prompted the staffs of two hospitals to request consent for immediate Certainly this case would suggest that Giardia intestinalis should be considered in the evaluation of a typical ahdominal symptomatology In addition, it is not altogether recondite that World War II may increase the number of this parasite in the United States

Case Report

She had The patient was a divorceé, age 29 enjoyed good health until August, 1944, when she experienced vague abdominal pain, mild diarrhea, and chilly sensations Previously there had been a slight tendency to constipation On September 2, slight tendency to constipation 1944, she passed innumerable loose, watery bowel movements attended by severe colic. The frequency of stool ahated and the abdominal pain hecame unbearable. Her temperature was 102 F She was extremely ill and was admitted to a Brooklyn hospital She remained there two hours and left after refusing to sign consent for immediate

Later that day abdominal pain was so operation severe that she entered another hospital again she refused to be operated upon and signed She then placed herself under a physiherself out cian's care and was informed that x-rays disclosed "ulcers and colitis" After treatment there was little improvement in her condition Epigastric cramps and diarrhea recurred frequently possibility of surgery was discussed

On December 18, 1944, the patient consulted me In view of the history of having at my office worked in a shipyard for two years I sent her stool to the Tropical Disease Diagnostic Service of the Department of Health Giardia lamblia cysts were Department of Health reported Dr H G Shookhoff wrote, "I understand she has had various ahdominal symptoms symptoms occasionally arise with the parasite

found " Atahrine, 0.1 Gm three times a day for five days, The patient made a spectacular was prescribed recovery On January 15, 1945, and March 26, 1945, her stool was found to be negative for Giardia lamblia A gastrointestinal scrics on January 31, 1945, was normal Various laboratory tests, including complete blood count, urinc analysis, blood Wassermann, Widal, Brucella, paraty phoid A and B, typhus, stool for enteric organisms, and gastric analysis were negative

Though giardiasis may be unaccompanied by abdominal symptoms, Hartman and Kyser<sup>1</sup> found diarrhea present in 60 per cent and abdominal pain in 65 per cent of their series of 100 cases quency certainly was more than coincidence cases treated with atahrine, follow-up disclosed successful climination of the parasite and cessation of abdominal complaints in all but one case

JAMA 116 2835 1 Hartman, H R, and Kyser, F A (1941)

### FALL REFRESHER COURSE IN OTORHINOLARYNGOLOGY AT UNIVERSITY OF ILLINOIS

The University of Illinois College of Medicine announces its sixth semiannual refresher course in laryngology, rhinology, and otology, September 24 through September 29, 1945, at the College, in Chicago The course is intensive and largely didactic, but some clinical instruction is also provided

It is especially suited to specialists unable to devote a longer period for advanced instruction and to others steking a comprehensive review of the field of otorhmolaryngology The number of regis-

It is therefore desirable to trants will be limited The fee 18 apply for registration immediately \$50

When applying, give full details as to school and year of graduation, postgraduate training, college dogrees, etc Write to Dr A R Hollender, Chairman, Refresher Course Committee, Department of Otolaryngology, University of Illinois College of Medicine, 1853 West Polk Street, Chicago 12 Illinois

#### TAKING THE COUNT

There had been an epidemic of influenza in the town, and one physician who had had scarcely any sleep for a week called upon a patient who was suffering from pncumonia

"Begin counting," directed the doctor as he leaned over to hear the patient's respiration

The doctor was so fatigued that he fell asleep with his head on the sick man's chest

It seemed hut a minute when he awoke suddenly

to hear the patient still counting
"Ten thousand and twenty-six, ten thousand and twenty-seven "—Clin Med, May, 1945

### Postgraduate Medical Education

Programs arranged by the Council Committee on Public Health and Education of the Medical Society of the State of New York are published in this Section of the Jouanal.

The members of the committee are Oliver W H Mitchell, M D, Chairman (428 Greenwood Place, Syracuse), George Bachr, M.D and Charles D Post, M.D

#### Three Cancer Teaching Days in October

A CLINICAL cancer teaching day will be held on October 3 at Homer Folks, Tuberculosis Hospi tal, Oneonta, under the auspices of the Medical Society of the County of Otsego, the Sixth District Branch of the Medical Society of the State of New York, the Tumor Clinic Association of the Stato of New York, the Modical Society of the Stato of New York, and the Division of Cancer Control of the New

York State Department of Health

łŧ

٤ì

ı ţ

> The teaching day will begin with a clinical program from 2 00 to 4 00 ru consisting of clinical gram from 2 to 10 4 to 17 a consisting of climical demonstration and discussion of cancer patients by Drs. William A. Villner associate professor of urology at Albany Medical College Fred W Stewart, pathologist at Memorial Hospital New York City, Norman Treves associate surgeon Memorial Hospital, New York City, and Gray H. Nemorial Hospital, New York City, and Gray Invendily, assistant surgeon, Memorial Hospital, New York City The afternoon meeting will be called to order at 400 fe M. with opening remarks by Dr. Paul Van Haeseker, president of the Medical Society of the County of Otsego. The charman of the meeting will be Dr. LeRoy B. House, also chairman of the cancer committee. The program consists of two lectures, 'Ovarian Carcinoma," by Dr. Twombly, and 'Cancer of the Breast,' by Dr. Treves. Following duncer, to be served at 6.15 Treves Following dinner, to be served at 6 15 rm., Dr House will call the evening meeting to order at 7 15 rm. Dr Milner will discuss "Carchoma of the Bladder" and Dr Stewart will give a lecture entitled Blopsy in Tumors." The local committee Clarke, John M. Constantine Richard Kegel and Charles H. Peckham

N OCTOBER 17 a cancer teaching day will be held in the Governor Clinton Hotel in Kingston under the auspices of the Medical Society of the County of Ulster, the Third District Branch of the Modical Society of the State of New York the Tumor Clinic Association of the State of New York the Medical Society of the State of New York, and the Division of Cancer Control of the New York State Department of Health. At 320 P.M the meeting will be called to order by the charman of the meeting, Dr. Franca L. O Connor chairman of the meeting, Dr. Francis E. O Connor chalman of the cancer committee, and Dr. Mortimer B Downer, president of the Medical Society of the County of Ulster, will give the opening remarks. Dr. Earl D Osborne, professor of dermatology and syphilology at the University of Buffalo School of Medicine will speak on "Cancer of the Skin and Allied Tu-mors," and Dr. Frederick B. Wetherell, professor of ellnical surgery at Syracuse University College of Medicine, will discuss "The Role of the Practicing Physician in the Care of Cancer"

Physician in the Care of Cancer
Dinner will be screed at 6 30 p.m. and the evening
meeting will be called to order at 7 30 p.m. by Dr.
O Connor Dr. Charles B. Huggins, professor of
surgical urology at the University of Illinois,
Chicago will deliver a lecture entitled "Cancer of
the Prostate," and Dr. Fred W. Stewart, pathologist
at Memorial Hospital, New York City, will speak or
"Biopsy in Tumors," The cancer committee of the
county society is us follows. Drs. Francis E.
O Canac chairmon, William S. Bush, Frederic W. county socioty is as follows Drs. Francis E O Connor chairman William B Bush, Frederic W Holcomb, B F Mattison Edward F Shea Frederick Soyder, James S Taylor, Frederick H Voss and Charles O Relly DDS

A CANCER teaching day will be held on October 18 in the auditorium of the Albany College of Pharmacy, under the auspices of the Medical Society of the County of Albany, Albany Medical Society of the State of New York, the Tumor Clinic Association of the State of New York, the Tumor Clinic Association of the State of New York and the Division of Cancer Control of the New York State Department of Health ment of Health

Dr John J Clemmer, chairman of the cancer committee, will also act as chairman of the meeting and will call the meeting to order at 3 30 r.u.
Opening remarks will be hy Dr Arthur J Walling
ford president of the Medical Society of the County
of Albany

Dr. Hayes Martin, attending surgeon, Memorial Hospital, New York City, will deliver a lecture entitled 'Cancer of the Head and Neck," and Dr. Charles B. Huggins professor of surgical wrology at the University of Illinois, Chicago, will speak on "Cancer of the Prostation,"

speak on "Cancer of the Prostate."

Dr Emerson C Kelly, chairman of the program committee, will call the evening meeting to order at 8 00 PM following buffet support at the fort Orange Post, Amenican Legion at 6 30 PM. In Gorgo T. Pack, attending surgeon at Memorial Hospital, New York City, will discuss 'Cancer of the Stomach' and Dr. Clyde L. Randall, professor of gynecology at the University of Buffalo School of Medical Post of the Comment of the of cine, will speak on 'Hormone Therapy and the Provention of Gynecologic Malignancies.' The can vention of Gynecologic Mangiantics. Into can cer committee of the county society consists of Drs. John J Clemmer, Arthur F Holding and Arthur W Wright, and the program committee includes Drs Emerson C Kelly John B Horner, John G McKeon Thomas J O Donnell Philip S Van Or den Robert D Whitfield and Aibert M Yunich

### Medical News

### Baruch Gifts Aid Physical Medicine

FAR-REACHING advances were made in the field of physical medicine last year, particularly in rehabilitating and reconditioning wounded war veterans, Dr Frank H Krusen, director of the Baruch Committee on Physical Medicine, recently

reported

Established a year ago by Bernard M Baruch with an initial grant of \$1,100,000, the committee established major medical programs at the Columbia University College of Physicians and Surgeons, New York University College of Medicine, and the Medical College of Virginia The Columbia project, a ten-year one, is emphasizing the need for training medical specialists to handle the problems of war and postwar physical rehabilitation

Later Mr Baruch donated \$90,000 more to further the work of helping veterans disabled in the war, Massachusetts Institute of Technology receiving \$50,000 and the University of Minnesota Medical School \$40,000 Fellowships have been established for qualified physicians or other scientists who seek

further training in this field

In the first annual report Dr Krusen expressed the gratification of his committee at the "truly remarkable progress" that has taken place since the grant was made. The report cites a medical journal as saying, in reference to the Baruch project that "the year 1944 will go down in the history of physical medicine as one of the great strides towards its long-delayed expansion"

In reply to a survey conducted by the committee 88 of 124 centers in physical medicine with which the committee had been in consultation reported significant advances in the development of physical medicine. Seventy-five of these centers said the advances were directly attributable to the activities

of the Baruch committee

Several new research programs are under way, Dr Krusen disclosed A special committee on war and postwar physical rehabilitation and reconditioning has been established to develop a program for the treatment of injured war veterans. Medical officers and technicians are being trained for this work at the Baruch centers. The number of fellowships will be increased.

New York University has taken the lead in developing means of helping the injured veterans

Instructional booklets have been prepared at the Baruch center at the university for the guidance of Army and Navy personnel An instructional motion-picture film for veterans has been completed

"We have plans under way now to emphasize the rehabilitation of veterans," Dr Krusen said "A subcommittee has been appointed to draw a blue-print or pattern of an ideal rehabilitation center. The completed plans will be sent to communities all over the country."

Dr Krusen emphasized that the program was designed not only for the war veterans but for the

civilian population generally

"We believe that an adequate development of physical medicine will do much to alleviate the suffering of the sick and disabled," he reported "It will hasten convalescence and lessen the number of totally disabled persons Physical medicine will tend to fill the gap between the customary endpoint of medical attention and the real necessity of many of the patients. It is hoped that as a result of physical medicine many veterans who would be bedridden under ordinary conditions will be able to walk and be active again."

Because a dearth of trained personnel exists today in this entire area, men and women are being trained to aid in the rehabilitation programs. Dr Krusen explained Physical medicine, which is a medical specialty, includes the use of the physical and other effective properties of light, heat, cold, water, electricity, massage, exercise, and mechanical

devices in diagnosis and treatment

In setting up the ten-year program, the Baruch committee allocated the following sums Columbia University, College of Physicians and Surgeons, \$400,000, New York University College of Medicine, \$250,000, Medical College of Virgina, \$250,000, for fellowships or residencies, \$100,000, to selected medical schools for immediate work in physical rehabilitation of war casualties and those injured in industry, \$100,000

Of the \$100,000 for minor research projects, Harvard University got \$25,000, the University of Southern California, \$30,000, University of Iowa, \$15,000, University of Illinois, \$15,000, Washington University, \$10,000, and Marquette

University, \$5,000

### Pediatric Oral Exam in December

THE American Board of Pediatrics announces that the oral examination will be held in Atlantic City at the Hotel Claridge, December 7-9 This

change was made because hotel reservations in New York were unavailable. The written examination will be locally under a monitor, October 19

### EMIC Services Extended to Provide Care for Veteran's Wives and Infants

FURTHER extension of the free maternity care for the wives of men in certain grades of the armed forces, and of free medical care for their babies was announced on July 20 by New York City's Acting Health Commissioner Frank A Calderone "Effective as of July 1, 1945," stated Dr Calderone, "the wife of a veteran may apply for maternity care and care for her baby during the first year of hie, un-

der the Emergency Maternity and Infant Care program, even after her husband has been honorably discharged, promoted, or demoted, provided she was pregnant during the period when he was in one of the four lowest pay grades of the services or was serving as an aviation cadet. On the same basis, she may apply if the husband and father is a prisoner of war, missing in action, or dead. Heretofore, the

application for care had to be made while the serv icemsn was in one of the clighle grades Non all that is required to establish eligibility is proof that the wife was pregnant while he was in one of the

eligible grades.
"The infant in these cases is also eligible for full care during his first year of life continued Dr Calderone, "If the father of an infant whose mother did not receive care under the pregram was in one of those grades at any time during the Infant's first year of life the infant's eligibility for

care under the program is established

To give infants the best possible protection, the mother's application for moternity care under E.M.I C now automotically carries with it an ap-plication for the care of the holy if he bocomes ill during the first year of life. And, as under previous arrangements, mothers desirous of advice and supervision for their well halnes may use the facilities of the Health Department's sixty four child-health stations conveniently located throughout the city

We want to be sure that no serviceman's family

who is eligible for care is neglected - concluded Dr. Calderene "Prevision, therefore has been made to care for those wives who are not able to furnish satisfactory evidence of the husband's rank or rating at the time maternity service or sick infant care 13 needed

Pending verification of eligibility the Health Department will authorize whatever service is required. If it is later found that the applicant is incligible because the husband was not in one of the four lowest poy grades at the time of the prug nancy or the illness of the infant, the anthonzation for care under E.M I C will be terminated when such information is officially received. Services provided prior to the lime the patient, physician or hospital is notified of the termination of the author

zation will, however be paid for "
A free booklet on E.M.I.C services, listing the addresses of the child health stations, may be obtained by mailing a request to the New York City Department of Health 125 Worth Street New

1 ork 13, New York

#### The Army Will Release Seven Thousand Doctors Soon

THE War Department, which has been criticized for alleged slowness in releasing doctors stated on July 16 that nine hundred medical corps officers had loft the Army since January 1, and that about seven thousand more would be released in the next nine months.

These discharges a department statement said are "in furtherance of the War Department's policy to return as many doctors to civilian prac-tice as can be spared by military needs"

One thousand medical-corps officers are returning from Europe to this country to relieve shortages of doctors in Army hospitals This also will make it possible to send doctors overseas who have not yet served abroad and to merease the rate of return of doctors to civilian practice, the Army said. It warned, however, that in the last six months the

patient load in Army hospitals in this country had

doubled

The department has maintained that it never had as many doctors as it needed. It was calculated early in the war that 64 000 would be required, whereas only 45,000 were carolled "There will be an initial ign in the discharge of

medical officers over other officers because sick and

wounded soldiers remain in hospitals long after battles are over "tho dopartment stated.

Provision is made, however for their release as soon as possible it said, adding

"The peak load of patients in Army general and convalescent hospitals in the United States is not expected to be reached before lale this fail, assuming that the present ensualty rate in the Pacific con-

The Army also warned that some specialists whose talents are absolutely essential cannot be easily released, and that medical officers in the Pacific cannot be returned "until replacements are available."

#### Rules For Illness Rations Extended by O P A

A DDITIONAL provisions covering the assuance of extra food rations for medical reasons were announced on July 17 by the Office of Pres Administration The O.P.A explained that although rationing regulations have for some time allowed additional food for persons who need it because of illness, assumces for this purpose now can be simple flect on the hasis of exponence gained in handling illness rations in the past. The new prevision vil allow O P.A. regional and district offices, on the ad-vice of regional or district medical committees, to delegate authority to local boards to issue rations for lilinesses that formerly required special handling and individual review by medical committees

The new plan also permits local boards in accopt certifications for ilinese rations signed by any li censed practitioner authorized by the laws of the stata in which he practices to diagnose and treat the iliness for which certification is made. Formerly only a heensed practitioner properly qualified to register under the Federal Narcotic Law could certify applications for lilness rations. July's action amounts to an extension of certification authority to include such practitioners as chirepractors in states where they are authorized by law to diagnose and treat the iliness for which the certification is made

The chonges announced will facilitate the issuance of additional rations in those persons actually need ing extra rationed foods for health With increasing numbers of people sufforing from diotary deficioncies coming back to this country, these steps are necessary to make the rations more readily available, O P.A. said. Explaining the system of granting ex-tra rations for dictory purposes O P A said that when food rationing was first started, it was realized that people suffering from certain diseases would require special consideration OPA, sought sound medical advice in order to give those persons actuolly needing extra rationed food for health the

right kinds and amounts of the required foods.

The National Research Conneil, which is made up of men representing all hranches of medical sel ence and research was asked to advise the agency The Medical Food Requirements subcommittee of this Connell, which has access to the most mod-ern mathods of treating Illness and has studied the dletary needs of persons suffering from various kinds of diseases prepared material listing those illnewes or conditions generally recognized by the medical profession as needing extra food. The subcommittee also included the quantities of food generally prescribed for such diseases. The illnesses or conditions listed by the subcommittee are those on which there is general agreement that additional food is essential. These diseases are diabetes, tuberculosis, chronic nephritis, and cirrhosis of the liver. Also listed are chronic suppurative diseases, burns, and gastrointestinal lesions, and pregnancy and lactation.

Each O P.A local War and Price Rationing Board is guided by prepared charts based on the material developed by the subcommittee of the Council The charts list the illnesses, the kinds of food recommended, and the amounts of each type of food in pounds or quarts Previously, when the local board received an application for extra rationed food from a person suffering from one of the diseases listed on the chart, it could issue the number of stamps required to give that person the kind and amount of rationed food specified on the chart for the particular illness The board thus granted extra rations in the amounts prescribed by the applicant's own doctor, so long as they were within the limits that the Council's subcommittee had recommended to OPA. Applications for extra rationed foods from people with an illness not included on the chart, or requesting quantities of food not specified were referred by the board to the OPA regional or district office for consideration by its medical nanel.

Under the broader plan, the regional or district office, upon the recommendation of the medical panel, may instruct local boards to issue more rationed foods than are listed on the chart. Regional or district offices also may instruct the board to issue specified amounts of rationed foods for diseases other than those listed when applications are received covering physical conditions previously specified by the medical panel. In such cases, the local boards will issue the specified amounts of rationed foods without referring the applications to the district or regional office for consideration by the medical panel.

The medical panels are made up of physicians of the highest standing in their communities. They are volunteers and serve without pay. Such a panel working with OPA's regional or district office reviews applications that are not covered by the material prepared by the Council's subcommittee and, under the broader plan, for those conditions for which the panel has not previously recommended specified amounts of rationed foods. Local boards are guided by the panel's professional advice.

are guided by the panel's professional advice

To apply for additional food rations, the person
needing them and his physician fill out a simple form
that gives OPA the necessary information, that
is, the patient's and the doctor's name and address,
the reason why the additional rations are necessary
or the name of the disease, and an indication, by the
doctor, of the kind and amount of food that is required

### Eye-Bank to Give Fellowships

TEACHING and research fellowships to extend the knowledge and skill required for the delicate operation which restores sight to a blind person with a corneal defect through the grafting of healthy corneal tissue will be established in leading medical schools throughout the country by The Eye-Bank for Sight Restoration, Inc., it was disclosed in New York City on July 16 by Mrs Henry Breckinridge, executive director. To carry on this program of education and research, as well as its other activi-

ties, The Eye-Bank will undertake to raise \$1,000,-000

An initial grant of \$25,000 has been made by the Milbank Memoral Fund to enable The Eye-Bank to function pending the time when the importance of the undertaking may gain recognition and widespread support

It is hoped that financial support will be fortbcoming from the general public in sums of any

amount

### Anniversary of the Army Medical Department

THE Army Medical Department celebrated its one hundred and seventieth anniversary on July 27 of this year with the realization that it has grown into the largest organization of the kind ever known and that it is giving this nation's army the best medical care that soldiers have ever received

From its inception in 1775 shortly after General George Washington became Commander-in-Chief of the Continental Army until the present day, the Army Medical Department has made steady progress in military medicine, it has made scientific discoveries that have benefited all of mankind, but never has its progress in both of these categories been so rapid as in recent years

The Hon Robert P Patterson, Under-Secretary

of War, in a tribute to the work being done by the Medical Department under Maj Gen Norman T Kirk, the Surgeon General, recently said that no army at any time in history has achieved a record of recovery from wounds and freedom from disease comparable to that of the American Army in this war Mr Patterson said also that the Medical Department is attaining new records in almost every field of its endeavor. He cited the Army's record of saving nearly 97 of every 100 wounded soldiers who reach Army hospitals, the disease rate of less than one in one thousand, and similarly startling figures with reference to malaria, the dysenteries, and other diseases, showing that the Medical Department has established effective control on all disease fronts

### County News

### Bronx County

At a meeting in the Concourse Plaza Hotel, the Bronx County Medical Society elected the followmg officers for the ensuing year Dr Frank La-Gattuta, president, Dr Sidney Cohn, president-

elect, Dr Samuel Weiskopf, vice-president, Dr Goodlatte B Gilmore, secretary, and Dr Joseph A Landy, treasurer Committee chairmen are public relations, Dr Henry J Barrow, medical

economics, Dr John L. O Brien, legislation, Dr Harry Aranow, public health, Dr Joseph Golomb, and Dr Philip Eichler, editor of the Bulletin \*

#### Cattarangus County

### Oneida County

Dr Edward Rutherford Cunniffe, president of the Medical Society of the State of New York, was the speaker for the Oncida County Medical Society on July 10 at the Rome Army Air Depot An inspection of the depot at 6 00 PM preceded the meeting at 7 15 P V

### Onondaga County

The executive board of the New York State Association of School Physicians met on June 28 in Syracuse Attending were Dr Clarence A. Greenleaf, president, of Olean, Dr Edgar Bieber, vice-president, of Dunkirk, Dr Clara Adele Brown, secretary-treasurer, of Oswego, Dr Lewis Wade Heizer, of Watertown, Dr William E Ayling, of Syracuse, Dr Michael Levitan, of Rome, and Dr John E Burke, of Schenectady

### Queens County

"Cancer has displaced pneumonia in the death statistics and is second only to heart trouble," Supreme Court Justice Charles S. Colden, of Whitestone, said on June 25 as plans to establish a cancerprevention clinic were made at a meeting in the auditorium of Triboro Tuberculosis Hospital,

A motion by Appellate Justice Frank F Adel. of Kew Gardens, was carried unanimously that a committee of ten doctors and five laymen be formed to determine the ways and means of setting up the

clinic \*

The following story is taken, in part, from the Jamaica Press

Dr Douglas J Glorgio, who closed his Hollis office two rears ago to join the Navy, went through the long battle of bloody Okinawa in the South Pacific ministering to the wounded in a truck-trailer that was converted into a mobile

wounded in a truck-trailer that was converted into a mobile operating room

The story of Dr. Glorgio's work on Okinawa was told today by Sergeant Ed. Meagher a Marine Corps combat correspondent who said that the doctor and his staff christened their trailer Old Indomitable hecause nothing could stop this hospital on wheels.

Meagher writes

"Ashore, coral notwithstanding, Old Indomitable quickly became the pride of the entire Sixth Marine Division's medical battalion, of which E Company is a part.

In any sort of hattle a mobils surgery is useful but the unexpected rapidity of the Sixth's advance on Northern Okthaws made Old Indomitable invaluable. The mobile operating room which should have filled a supporting role, became s star Careening ludicrously behind a six-by-six truck abe rode

at the heels of assault Marines. Over Okinawa roads never meant for trailers of her generous girth—over rutted roads, rocky, boulders, and slippery roads, each a vehicular obstacle course, lumbered the medical trailer.

"Once, to reach a bivouac area near a schoolhouse atop a steep hill, she outdid herself. She climbed a stairway.

"There must have heen fifty or sixty steeps leading up to the school. She humped right up 'em without a stop.

"Old Indomitable's interior is smaller than most Stateside supersize. But the comparable otherwise.—even to a porce-

"Old Indomitable's interior is smaller than most stateside surgeries. But it is comparable otherwise—even to a porcelain sink with hot and cold running water. A generator supplies electricity, there are direct and indirect lighting. "Lieutenant Giorgio snapped a wall switch and the surgery was lit with soft light from fluorescent tubes in the ceiling." "There you are, said Giorgio, 'absolutely the only fluor escent lighting on Okinawa'."

Rensselaer County

Dr John J Quinlan, Troy physician, was the principal speaker at the annual commencement at Heatly High School, Green Island, in the school auditorium on June 27, at 3 00 PM \*

### Richmond County

Dr Leif G Jensen has been released by the US Navy after serving two and one-half years as a lieutenant commander, and has resumed private practice with offices in the Medical Center, Tompkınsville \*

### Rockland County

The regular summer meeting of the Rockland County Medical Society was held at the Rockland Country Club, Palisades, Wednesday, June 27 After a short business meeting, the society was addressed by Mr George P Farrell, director of Medical Care Insurance for the Medical Society of the State of New York Mr Farrell talked briefly on the voluntary nonprofit medical plans in operation throughout the State of New York, explaining in detail the "Doctors' Plan" providing for surgical procedure and in-hospital medical care on a service basis to subscribers whose incomes are within certain limits, doing much to clarify this subject for the physicians present

The meeting was followed by a dinner at which the Society members were the guests of the President, Dr Edwyn O'Dowd

### St Lawrence County

A meeting of the St Lawrence County Medical Society was held at the Massena Country Club on June 14 A luncheon was served at 12 15 PM and the lecture which followed luncheon was given by Dr Ellery G Allen, of Syracuse Dr Allen is assistant professor of clinical medicine and pathology at Syracuse University College of Medicine The subject was "Résumé of Hematologic Disorders Including the Anemias"

### Schenectady County

Lt Col Jacob Frumkin recently was made commanding officer of the provisional general dispensary which services the medical needs of the Allied nations in Paris and was given his present rank, it was reported on June 25

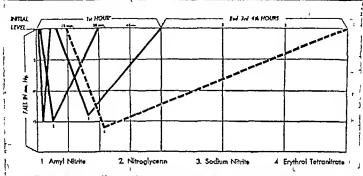

A specialist in urology and a staff member of Ellis Hospital for several years, he is a graduate of Albany Medical College He interned at St Peter's Hospital in Albany and Morrisania Hospital in

New York

Colonel Frumkin entered the army in March, 1940, and was sent overseas in January, 1941 was stationed in England and North Ireland before being sent to Paris 4

# PROLONGED REDUCTION OF HIGH BLOOD PRESSURE

Comparative effects of commonly used nitrites on systolic blood pressure in normal individuals. The action of Erythrol Tetranitrate, Merck begins in 15 minutes and persists for three to four hours.

Treatment of arterial hypertension today is necessarily directed toward relief and not cure. When such measures as rest and dietary control have been unsuccessful, the employment of medical treatment is suggested Among the various preparations available, Erythrol Tetranitrate offers the advantage of producing a reduction in blood pressure sufficiently prolonged so that administration three times daily may maintain the reduction. Erythrol Tetranitrate Merck may be prescribed over a protracted period with sustained effect. By dilating the peripheral arterioles, it tends to decrease not only the stress of excessive pressure on the arterial walls, but also to relieve the burden of the heart.

### Hospital News

### Index of Current Hospital Literature Published by A H A

PUBLICATION of the first issue of a continuous index of current hospital literature-making available for the first time in one place lists of articles dealing with bospital problems—is announced by the Bacon Library of the American Hospital Association Twice yearly, in January and July, this unique index will present in book form a comprehensive list of articles appearing in current periodicals of the previous six months

Available at a subscription cost of \$3 00 per year, the index is a reference source for material on specific subjects and is also an author index Current trends and thinking are brought out in the subject

headings which serve as a guide to reading

Listing by both author and subject articles which

discuss some phase of hospital administration or a subject of interest to hospital people, the first copy, now just off the press, indexes sixty-six different periodicals Complete bibliographic information is given for each entry

Size  $5^{1/2}$  by  $8^{1/2}$  inches, the index will be punched so that copies may be kept in a binder In addition, a cumulative index will be published at the end of

citber three or five years

Hospital administrators, students, librarians, and others interested in hospitals-their improvement and their problems-may subscribe to this worthwhile publication by writing to its initiator—the Bacon Library of the American Hospital Association, at 18 East Division Street, Chicago 10, Illinois.

### At the Helm

Chester H Lang was re-elected president of the board of managers of Ellis Hospital, Schenectady, at a meeting on June 25 Others elected were R. H White and Arthur S Golden, vice-presidents, Allen D Marshall, treasurer, and W Howard Wright,

Elected managers of the bospital association were Mr Golden, Jesse R. Lovejoy, Charles G Mac-Mullen, Joseph Nushaum, John Weber, Mr Wright, and Ellis F Auer \*

The Meyer Memorial (City) Hospital Board of Managers in Buffalo on June 25 named Dr. William Jacobs as acting superintendent pending the selection of a successor to Dr William T Clark Efforts to fill the post have eaused much discussion m medical, political, and educational circles, particularly because of the nomination of OPA Director Thomas J Reese, a nonmedical man, who

Dr Jacobs is hospital pathologist and has been associated with the institution more than twentyfive years. His name was placed before the board by Dr Clark, whose resignation became effective

July 1 \*

Miss Hazel Hallett, who has been superintendent of the Little Falls Hospital for six years, will become superintendent of the Utica Memorial Hospital September 1, succeeding Miss Julia Hardy, who is retiring after twenty-eight years in that post Sbe is a member of the Central New York Hos-pital Council and the American Hospital Associa-

tion \*

Two new interns and a new resident physician joined the staff of Mount Vernon Hospital July 1, it was announced on June 21 by Donald Morrill,

superintendent of the bospital
Replacing Dr Paul Lowy as resident is Dr
Clinton S Scholes, Jr, who interned at United
Hospital, Port Chester Dr Scholes, whose home is

in addition to his x-ray work there, has become assistant to Dr Cole, chief roentgenologist at the Hudson City Hospital Dr Jacobs began his work at the Hudson City Hospital on July 1 He will continue his duties at the Catskill institution

Before specializing in x-ray work Dr Jacobs was in general practice in Hudson for many years \*

### Newsy Notes

A \$98,700 subscription to the Buffalo General Hospital's \$4,000,000 building fund by Spencer Kellogg and Sons and Mr and Mrs Howard Kellogg, Sr was reported on June 25 by Carlton P Cooke, campaign chairman

Of the total, \$67,500 which was given by the firm is to be used to build, furnish, and equip an intern's laboratory, basal metabolism department, and a chemistry lecture room on the second floor of the enlarged hospital The rooms are to be dedicated in memory of Spencer Kellogg, founder of the com-

Two nursenes on the tenth floor will be established with the \$24,000 gift of Mr and Mrs Kellogg One will be dedicated to the memory of Mrs Cyrena Case Kellogg and the other in memory of Mr Kellogg's mother, Mrs Jane Morriss Kellogg

Through the remainder of the gift, Mrs Kellogg and Mrs Louis Hausman will dedicate a four-bed room in memory of their parents, Mr and Mrs Henry May \*

The St Joseph's Hospital, Elmira, Board of Directors ordered on June 22 plans prepared and preliminary studies made for a new maternity and pediatries building to be erected after the war The present maternity annex will be converted

into the convalescent branch of the hospital The hospital board also decided to enlarge the

institution's laundry

Date of beginning the new construction will depend largely on priorities and availability of materials Officials pointed out it would take some time to make the preliminary studies, decide what type of building will be desirable, and have detailed plans

Flushing Hospital, Queens, authorities, who for some time have been confronted with the growing need for additional facilities at the institution, have decided to complete the third floor of the new wing, which was left unfinished when the addition was built in 1927

The project, which is to cost about \$60,000, will be completed in September and will contain rooms und facilities for thirty-seven additional beds for medical and surgical cases Tlus will bring the hospital's bcd capacity to three hundred and fifty-eight, Judge John M Cragen, of Elmhurst, presi-dent of the Board of Trustees said on June 22 \*

The contagious ward in the new south wing of Tompkins County Memorial Hospital, closed some time ago for lack of nurses and other help, was reopened on June 25 for two weeks to care for tonsillectomies, Mrs Irene Oliver, hospital superintendent, announced

The ward can accommodate approximately 15 Registered nurses not employed by the hospital, Red Cross nurse's aides, and the Gray Ladies made possible the opening for the period \*

More than one hundred members of the Mount Vernon Hospital staff, the Mount Vernon Medical Society, and the hospital Board of Trustees, with their wives, attended an outing on June 20 at Leewood Golf Club Golf in the afternoon was followed by dinner

Among those present were several local physicians

recently returned from overseas service
Introduced by Dr. Henry W. Kaessler, president
of Mount Vernon Hospital General Staff, who presided at the dinner, Dr William A. Kelly, president of Mount Vernon Medical Society, called attention to the fact that the Mount Vernon Medical Society is celebrating its fiftieth anniversary this year \*

Cooperation of the Newburgh Chambor of Commerce with officials of St Luke's Hospital in an effort to provide improved ambulance service for Newburgh was proposed to Chamber directors on June 21 by Morris B Wallach, chairman of the Chamber's Safety Council.

Delays in responding to emergency calls and a comparison with the ambulance service furnished by Cornwall Hospital featured the discussion, but no action was taken by the Chamber directors, pending a reply from C B Allen, superintendent of St Luke's, to a letter in which the Safety Council offered to help get an ambulance for St Luke's as a means of remedying existing conditions

A victory center committee headed by Mrs. Frederick A Kreuzer offered its aid on June 20 in relieving the help shortage in Syracuse hospitals

At a meeting of the Syracuse Hospital council at new Syracuse General Hospital, Mrs Kreuzer agreed to refer women for volunteer and paid positions in maintenance and housekeeping Kreuzer's committee deals with replacement of women who lose war jobs because of reconversion

The late George Tuttle, civil engineer and former resident of St George, left \$5,000 to Staten Island Hospital and \$1,000 to the Staten Island Institute of Arts and Sciences, it was disclosed late in June when his will was filed for probate in Manhattan Surrogate's Court \*

tion has contributed to the New Rochelle Hospital, it was announced on June 25 Patrolman Daniel Kraft, president of the association, has turned over to Alex Norton, superintendent, a \$500 check to endow one of the new rooms in the huilding to be erected this year A room in the present hospital huilding was endowed by police several years ago \*

Dr George S Reiss, president of Long Beach Hospital, announced on June 23 that the name of the institution has officially heen changed to the "Memorial Hospital of Long Beach," in keeping with the plan to make it a memorial to the men from the area killed in the war \*

The Ossining Hospital huilding fund drive swept far beyond its \$300,000 goal as final reports at a dinner meeting on June 25 at the Briar Hills Golf Cluh revealed total subscriptions of \$335,219 66

The subscription will provide a new wing, increasing the hospital's capacity to 115 patients, and

also provide a nursery for newborn infants

A children's wing will he huilt on the first floor of the original building, and the new wing will contain a thoroughly modern delivery suite, a surgical department, and x-ray and physical therapy departments \*

The Onondaga Sanatorium and the county home hospital will benefit materially through action by the board of supervisors at its special meeting on June

25 The major part of surgical instruments, medical supplies, and medicines purchased by the county at a cost of approximately \$5,000 in the early days of civilian defense will be transferred to the two institutions through liquidation of the Onondaga County consolidated war council \*

A special tuberculosis department in the new Buffalo General Hospital huilding will play a major role in the area's fight to reduce a high mortality rate attributed to the disease, Dr Miller H Schuck of the hospital staff, said on June 23

Crediting the Buffalo and Eric County Tuberculosis Association with a "splendid program to promote discovery of the disease," Dr Schuck pointed out that the new department at the General Hospital will he mainly for diagnostic and surgical treatment of patients \*

The tuberculosis admission hureau of the Department of Hospitals, formerly located at 125 Worth Street, now has its offices at 535 East 80th Street, New York City The telephone number is REgent 7-3400 Application cards should be sent to the new address

The Goldwater Memorial Hospital has a position as jumor executive physician, at \$1,740 a year, open Interested applicants may apply by letter or phone (PLaza 3-1860) to Dr C G Scherf, medical superintendent, Goldwater Memorial Hospital, Welfare Island, New York 17, New York

### HEALTH DEPARTMENT WARNS WILD MUSHROOMS MAY CONTAIN DEADLY POISON

Pointing out that many of the varieties of wild mushrooms growing in and around New York City contain deadly poisons, Acting Health Commissioner Frank A. Calderone appealed to New Yorkers not to gather or eat any mushrooms found growing wild in the parks or in the countryside outside the city. Dr. Calderone revealed that during the Fall of 1944, 9 cases of mushroom poisoning were reported to the Health Department. Two of these cases resulted in death

"One of the most dangerous things about wild mushrooms," said Dr Calderone, "is that there is no general way of distinguishing the edible from the poisonous varieties. There are some 80 types of poisonous mushrooms with a great range of shapes and colors. Several of them are very similar to the edible types which are so highly prized on the dinner-table.

"Unfortunately," Dr Calderone continued, "taste offers no safeguard, for some of the most deadly species have a delicious flavor. Nor is there any truth to the belief that poisonous mushrooms can be detected by peeling them or by placing a silver spoon in the pan in which they are cooking to see if it darkens. Such so-called tests are mere superstitions and have absolutely no value."

Dr Calderone then warned that one variety of poisonous mushroom which flourishes in this area is

very similar in shape and color to an edible wild mushroom which is found in Southern Europe People who are familiar with the European species and have heen accustomed to pick and eat these mushrooms often mistake the New York type for the edible one Many of the mushroom-poisoning cases in this area can be traced to this error

"It should also be remembered," Dr Calderone emphasized, "that no amount of cooking—no matter how long or under what pressure—can destroy the injurious substances found in wild poisonous mushrooms. These poisons are so potent that a considerable percentage of the people who become ill after eating poisonous mushrooms die Young children are especially susceptible and in certain cases, only a small part of a single mushroom has been sufficient to cause death.

"Residents of New York City need not endanger their lives by eating wild mushrooms they have picked or purchased from itinerant peddlers who also cannot distinguish the edible from the poisonous types. Mushrooms offered for sale in the markets of this city are especially cultivated and are absolutely safe," he concluded "By buying her mushrooms from a reliable merchant, the New York housewife can he sure of giving her family a food which is a wholesome, tempting addition to the daily menu."

### Correspondence

June 28, 1945

To the Editor

In your issue of June 15, there is presented an article by Dr John H. Garlock (page 1309) on "Further Experiences with the Surgical Treatment of Intractable Ulcerative Colitis" In his article the author states that he is presenting his "present viewpoint based on an analysis of 68 cases"

In the factual data which follow, there are many confusing statistical features, most particularly related to the very finite question of surgical mor-These warrant clarification in view of the importance of this problem to surgeon, internist, and patient alike Dr Garlock states that "between September, 1937 and April, 1944 we have In 38 instances the operated upon 68 patients primary operation was ileostomy Of the remaining 32 patients, 5 were subjected to subtotal colectomy." Since this totals 70 patients, it may be that two patients were included in both series If this is so, it should be stated

In the first group of Dr Garlock's patients in which "the primary operation was ileostomy" there were six deaths, a mortality of 15 7 per cent. It is to this figure that Dr Crohn refers in his discussion which follows the article In the 32 patients of the second group, "there were no deaths," so that the reader is justified in concluding that the over-all surgical mortality is six in 68 (or 70) patients, ap-

proximating 11 per cent

Since reference to the remainder of the text indicates that the mortality is in excess of 26 per cent, it would seem that you, as editor, and Dr Garlock, as author, owe it to your readers to present some explanation of the discrepancies more particularly

described in my next paragraphs

Of the 38 patients who had a primary ileostomy, 21 had a secondary subtotal colectomy with four deaths. Of the survivors of the two-stage operation in this original group of 38, "one developed a severe recurrence in the rectum three weeks after the operation and died of peritonitis from a perforation of the upper rectum", another "died one year later of intestinal obstruction caused by torsion at the site of anastomosis", another 'died three years after operation of intestinal obstruction caused by a band, with gangrene of a portion of ileum " If our interpretation of Dr Garlock's writings is correct, there were therefore thirteen surgical deaths in the primary

group of 38, or something in excess of 34 per cent!
Unfortunately, this is not the end of the story of
mortality, since Dr Garlock speaks of three other subgroups These obviously do not belong with the primary ileostomies, so that it must be assumed that they are included in the remaining group of 32 patients in which it is claimed there had been no In this final trio of subgroups, there were six who had primary transverse colostomies Of these, "one patient died after an abdominoperineal resec-In another group of 13, "one patient died three-ears later of intestinal obstruction caused by a band" In a miscellaneous group of 10, "two died postoperatively, one of sulfamilamide hepatitis and the other of peritonitis caused by unnecessary and ill-advised handling of the cecum at the time of operation" Another was "submitted to an illadvised and poorly executed operation and succumbed to generalized peritonitis". These additional deaths, added to the 13 in the ileostomy group, bring the total to 18 deaths in what is stated

to be "an analysis of 68 cases" This figure gives a total immediate and delayed surgical mortality of 26 per cent<sup>1</sup>

That these discrepancies require explanation and

clarification, there can be no doubt.

Yours, HAROLD THOMAS HYMAN, M D 940 Park Avenue, New York City

July 16, 1945

To the Editor

I welcome the opportunity of answering the letter of Dr Harold T Hyman which you so kindly sub-

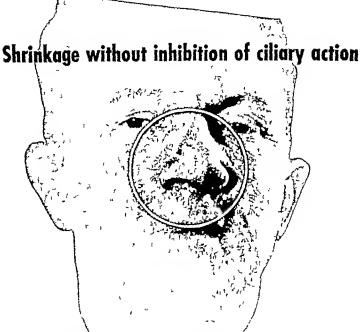

It is surprising that Dr Hyman was so "confused" by the statistical features of this article, because by the simple process of subtraction and addition one could with ease follow the trend of thought expounded in this paper. It was not my intention to enter into an extensive statistical review of the material presented. As indicated in the title, the paper related our further experiences in the definitive surgical treatment of intractable ulcerative colitis in an attempt to place such therapy on a sound scientific basis and present the unvarished facts relating to, first, the indications and mortality of ileostomy, second, the risk involved in the more extensive colon resections, third, the future outlook of patients subjected to surgical therapy, and finally, to my mind an important feature, the eventual out-come of patients who had original disease in the rectum and in whom re-establishment of intestinal

continuity was finally effected

Let me try to clarify some of the simple arithmetical processes so that even Dr Hyman can under-Between September, 1937 and April, stand them 1944, we operated upon 68 patients In 38 instances the primary operation was ileostomy In these 38 cases there were 6 deaths Six from 38 leaves 32 These are the 32 cases which Dr Hyman "confused" The total still remains 68, and Of these 32 patients in the ileostomy group it is specifically stated in the paper that 5 of these 32 were subjected to subtotal colectomy in one or two stages, followed by abdominopermeal resection of the rectum There were no deaths in this group of 5 From the simple English of the paper and the simple mathematics, even Dr Hyman, in his enthusiasm, has no justification for concluding that the over-all surgical mortality is 6 in 68, In 21 instances of the original Let us continue ileostomy survivors subtotal colectomy was per-There were 4 deaths in formed in each instance this particular group and the causes of death veri-Four from 21 fied by autopsy are clearly described. Four from 21 leaves 17 Six of these 17 patients have had reestablishment of intestinal continuity It is stated specifically what happened to each patient in this In the remaining 11 no other surgical group of 6 procedure has been carried out

The remainder of the article is concerned with subgroups of ulcerative colitis involving segmental, right-sided, and left-sided colitis. A more than casual knowledge of the subject is required to understand the reasons for dividing this into sepa-Not only is the surgical approach difrate groups ferent, but the prognosis and the type of patient

under consideration varies considerably from that encountered in cases of diffuse ulcerative colitis

In the paper I have made a conscious effort to present as baldly as possible the actual story of the surgical treatment of ulcerative colitis from the favorable comments I have received I believe this purpose has been accomplished Perhaps Dr Hyman should confine his medical reading to subject matters which do not entail an extensive

knowledge of simple arithmetic While I appreciate his interest in reading the article and commenting upon it, I am sure you will agree with me that his enticisms are without foundation.

Very truly yours,

JOHN H GARLOCK, M D 50 East 77th Street New York City

### SENESCENCE, SENILITY, AND CRIME

The relation between age and crime is significant East1 emphasizes that most magistrates are not appointed until they have reached middle age, this preponderance of middle age and elderly judges, he feels, may be far from desirable in cases involving juvenile crime East quotes a circular in 1936 which declared that, "apart from the obvious advantages attaching to quickness of hearing and of sight in a justice, there is the fact that as time goes on men and women justices are apt to lose the freshness of mind and sympathy and the up-to-date knowledge of social conditions which are of extreme importance for successful work in the juvenile courts" The particular problems of the aged or senile person who commits a crime deserve special Although this report cites British figures and British problems, there is ample reason to believe that the situation in the United States is in most respects parallel The trial of aged persons by their contemporaries may be unsatisfactory, East says Age itself is not necessarily a true measure of senescence, using that word for the normal process of growing old, or of semility, used in a sense of abnormal mental states which sometimes supervene toward the close of life Consequently, special attention should be given to the manner of thought and behavior of the aged The onset of normal old age, or senescence, is a physiologic condition rather than a pathologic state, and it is therefore difficult to determine its onset. The chronologic age is often misleading as an index of the onset of this physio-logic process authorities have placed it in the early forties, at 55, at 65, and probably at many other Most modern students are inclined to agree with the late Sir Humphry Rolleston that in healthy persons the onset of senescence is so stealthy that it is seldom suspected by the person himself One man may be senile at 60 while another is vigorous in both mind and body at 80 In criminology the important feature of normal senescence is the degree of control exerted by the will when directed toward the discouragement of illegal acts which would put the interests of the individual ahead of those of society in general. East adds to this the action of the will in encouraging activities which are legal and useful to society, however strongly they may be opposed to the desires of the participant. When the hitherto blameless senescent becomes involved in illegal behavior as a result of mental deterioration,

he deserves, East says, the fullest understanding from those who judge him, and this requires insight into the background of his mental life

Normal aging passes into sensity when the impairment of intellectual, emotional, and volutional attributes of mind becomes excessive and the mental activities are imperfectly synchronized with resultant inability to form well-considered opinions, to evert sustained effort, and when social maladjustment results. The reason sensity develops in some persons and not in others appears to depend, at least in part, on the inherent constitutional makeup and the degree of cerebral arteriosclerosis present on the stresses which they have experienced, and indirectly on the manner of life Used in this sense, indirectly on the manner of life the term senility would be restricted to semile and arteriosclerotic dementias Although aged prisoners are generally treated under a milder form of discipline than others, the mental background of the offender before trial is also important but has received less attention than is due it. In matters involving eriminal responsibility in the aged, East says attention must be paid not only to the standards of so-called normal persons but also to the conduct and mental condition of the semile offender during his younger years Where mental abilities during his younger years. Where mental abilities are superior during the prime of life, it is especially easy to overlook perceptible degrees of deterioration due to age because the offender is compared with those of merely average intelligence and ability of comparable years

Out of a group of 9,197 prisoners of both sexes in the prisons of England and Wales recently convicted for various offenses, 290 were aged 60 years or over Of these, 71 were first offenders and 194 had been previously convicted three times or more number and proportion of aged persons in the population is constantly increasing. Although the incidence of crime among the aged and senile will doubtless years in removes to bared the senile and doubtless vary in response to hereditary, social, and economic factors as well as to age, the problem will doubtless increase more or less consistently working contact between physicians familiar with the mental problems of aging and of the courts 15 highly desirable in order that the cause of justice may be best served for those criminals of older years whose actions are affected by senescence or semility

### REVIEWED

Savill's System of Clinical Medicine Dealing with the Diagnosis, Prognosis, and Treatment of Disease For Students and Practitioners Edited by E C Warner, M D Twelfth edition Octavo of 1,168 pages, illustrated Baltimore, Williams & Wilkins Co , 1944 Cloth, \$9 00

The twelfth edition of this convenient volume on clinical medicine is at hand. This work is unusual in that its approach to disease states is via the presentation of symptoms and signs rather than through a consecutive listing of diseases. The system in one volume furnishes a handy quick reference work for the general practitioner and student.

George E Anderson

Essentials of Syphilology By Rudolph H. Kampmeier, M D. Duodecimo of 518 pages, illustrated Philadelphia, J. B. Lippincott Co., 1943 Cloth, \$5.00

This is a most surprisingly complete book on the subject of syphilis for one so small. It has been prepared by its author as "a brief text on syphilis for the practitioner of medicine". Five hundred about the practitioner of medicine "Five hundred about the highlights, some of which are the biology of the infection, including the natural course of the disease, the routine of history taking and examination of the patient, wherein many important points are stressed, the serologic diagnosis of syphilis which considers false-positive or false-

negative reactions, fluctuating responses, and evaluation studies. Therapeutic agents up to the time of penicillin are adequately presented.

Succeeding chapters on primary and secondary syphilis, with the special features and complications of early syphilis, are given. The author discusses quite well latent syphilis and late benign syphilis, indicating how and when these patients are to be treated, and when the patient deserves more consideration than the disease, by withholding treatment.

A chapter on syphilis and pregnancy is well presented, giving a brief but sane outline for the treat-

There are comparatively few photographs (about picty) and charts, but these presented are well

There are comparatively few photographs (about eighty) and charts, but those presented are well chosen. The entire book is well made and well written. It deserves a place in the library of every doctor or student who wants to be able to find quickly the essentials of syphilis in diagnosis, symptomatology, or treatment.

[Continued from page 1800]

for courses in the last two years of college or during the first years of professional education. It is full of valuable information and is written in a most readable style. It is a definite addition to the limited number of up-to-date texthooks in this field

THOMAS D DUBLIN

An Atlas of Anatomy In Two Volumes By J C Boileau Grant Volume II Vertebrae and Vertebral Column, Thorax, Head and Neck Quarto of 390 pages, illustrated Baltimore, Williams & Wilkins Co, 1943 Cloth, \$500

Although this atlas is not as complete as several of those of the older existing ones, it does show in greater detail many surgically interesting parts of the hody. It is, therefore, recommended to the physician as a useful adjunct to his library

WALTER SCHMITT

Rehabilitation, Re-Education and Remedial Exercises By Olive F Guthrie Smith Octavo of 424 pages, illustrated Baltimore, Williams & Wilkins Co , 1943 Cloth, \$600

Deformities and disabilities following injury have always constituted a large part of the problems of the orthopedic surgeon, and now wartime conditions have greatly increased their number and severity Thus the author and her associates have produced a book which is indeed timoly, being based as it is largely on actual war casualty experience Several novel points revising the usual concepts of kinc-siology are advanced, all of which appear to be logical and advantageous The importance of reeducation of affected muscles is stressed throughout the book, as is the correction of contractures and other deformaties. Interesting chapters are devoted to rehabilitation in the puerperium, the uses of electricity in rehabilitation, and the advanta-geous use of the gymnasium to the same end Special care following plastic operations is very well described, and the final chapter is devoted to consideration of some aspects of occupational therapy The book is well written and clearly printed and illustrated, and warrants careful study hy the physical-therapy aide and by every medical practitioner regardless of preference of practice

JEROME WEISS

Manual of Clinical Mycology Prepared Under the Auspices of the Division of Medical Sciences of the National Research Council By Norman F Conant, Ph D, Donald Stover Martin, M D, David Tillerson Smith, M D, Roger Denio Baker, M D, and Jasper Lamar Callaway, M D Duodecimo of 348 pages, illustrated Philadelphia, W B Saunders Co, 1944 Cloth, \$350

This volume is one of a series developed under the auspices of the Division of Medical Sciences of the National Research Council for use by the medical departments of the United States Army and

Navy

It is comprehensive in its scope and yet condensed in 347 small pages. The illustrations are excellent and the subject matter for each disease is covered under several headings so that the information desired is easily and quickly obtained. It is the composite work of five members of the Duke University School of Medicine. The hook seems to fulfill adequately its stated purpose and is to he highly recommended to all who are interested in the extensive subject of my cology.

JOHN C GRAHAM

Physiology in Health and Disease By Carl J Wiggers, M D Fourth edition, revised Octave of 1,174 pages, illustrated Philadelphia, Lea & Fehiger, 1944. Cloth, \$10

The fourth edition of this well-known text is a worthy successor to the earlier editions. The book is definitely planned as a teaching text for medical students and reflects the author's many successful years as a teacher. Information is presented compactly but adequately. The entire text has been reorganized to bring the factual matter up to date.

Special attention is given to the physiologic information that has accumulated as a result of war research. This material has been fully reviewed and organized in its applications to general medical

physiology

Each chapter is well documented as to reforences. The author's style of listing the important reviews and the hihliography at the end of each chapter is very useful for those demanding information beyond the scope of the text

Dr Wiggers's book is highly recommended to all those interested in the current trend of physiology

G B RAY

X-Ray Examination of the Stomach A Description of the Roentgenologic Anatomy, Physiology, and Pathology of the Esophagus, Stomach, and Duodenum By Frederic E Templeton, M.D. Octavo of 516 pages, illustrated Chicago, University of Chicago Press, 1944 Cloth, \$10

After having absorbed the teachings of the best American, Swedish, and German authorities Dr Templeton has, in a studious and critical way, worked out a method of examining the esophagus, stomach, and duodenum with the help of x-rays

His method makes use of scrutinizing fluoroscopy in closest association with radiography Adequate space is allotted to the description of the neces-

sary equipment—the filming fluoroscope

Mercilessly checking his results against clinic, gastroscopy, biopsy, and necropsy findings, he has acquired a vast experience in this field. His hook, with a thoroughly well-written text and numerous well-chosen and splendid illustrations, provides the readers with an exact description of the proper technic of conducting an examination and of skillfully eliciting and critically evaluating the findings

General practitioners, internists, surgeons, and roentgenologists alike will all greatly benefit by

studying this excellent hook

S W WESTING

The Management of Neurosyphilis By Bernhard Dattner, MD, with the collaboration of Evan W Thomas, MD, and Gertrude Wexler, MD Octavo of 398 pages New York, Grune & Stratton, Inc, 1944 Cloth, \$5 50

This treatise with supporting bibliography sets forth in some detail methods of treating syphilic of the central nervous system. The author uses as a guide in therapy the abnormal cytologic and hiochemical findings disclosed by repeated examinations of the cerebrospinal fluid. The indications for the several methods of treatment are well described. Specialists working in this particular field may regard Dattner's viewpoint as oversimplification of the problem. It would seem however, that for those less well experienced, this monograph should serve as a very valuable reference book.

UPERIOR PERSONNEL Amistrals and orners in all itsides of medicine—young physicians, department acid, names, staff personnel, secretaries, anaecthetists edicians and technicisms.

### SUGGESTIONS FOR CONTRIBUTORS TO THE NEW YORK STATE **IOURNAL OF MEDICINE**

The New York STATE JOURNAL OF MEDICINE asks its contributors to follow the suggestions listed below in the preparation of their articles way they will greatly facilitate the expeditious publication of the JOURNAL. These suggestions have been devised in order to save correspondence, avoid return of papers for changes, minimize the work of preparation for the printer and save the high costs or corrections made on galley proof

Size of Articles.—It is earnestly desired that scientific articles shall not exceed 6 Journal pages at the outside Longer articles tend to lower reader interest. An average of five or six seems to be the most desirable from this point of view Cal-culation can readily be made by multiplying the number of double-spaced typewritten manuscript pages by the fraction two-fifths e g twelve manucript pages will make five Journal pages

Manuscripts - Papers must be typewritten on one side only of white sheets consecutively numbered and be double spaced with one-inch margins They should be prepared with great care so as to be typographically correct. All headings, titles subtitles and subheadings should be typed flush with the left-hand margin. This is imperative for rapid and accurate composition by the printers

Titles.—The title should be brief and typed in capital letters. The subtitle can be longer and should be typed in caps and lower case letters. Under the title or subtitle, if there is one, should appear the name of the author and city in which he lives Directly under his name should be the hospital or institution with which he is affiliated.

Subheadings.—Subheadings should serted by the author at appropriate intervals

References.—It is the unfailing practice of the NEW YORK STATE JOURNAL OF MEDICINE to use specific references rather than "bibliography". There should appear in the text reference numbers, typed above and to the right of the word to which there is a reference A list, consecutively numbered, of these references should follow at the end of the manuscript (Note that spelling in list is same as in text) The arrangement should be as follows and should include all items

Books-author's surname followed by initials, tille of book, edition; location and name of publisher, year of publication, volume, and page number Thus, Osler, W. Modern Medicine, 3rd ed., Philadelphia. Lea & Febiger 1927, vol. 5 p 57

Periodicals—authors surname followed by

initials; name of periodical, volume, page. month (day if necessary), year of publication Thus, Leahy, Leon J New York State I Med 40 347 (March 1) 1940

NOTE: The JOURNAL does not include titles of articles

Case Reports -- Instead of abstracts of hospital histories, authors should write these reports in a narrative style with properly completed sentences Ill unimportant details should be deleted with such general negative statements as fit the case

Tables.—While tables are very useful on lantern slides in the reading of papers, they fail of this purpose to a large extent in the printed page. For that reason it is urged that they be reduced as much as possible to descriptive language

Illustrations —These should be kept to the minimum necessary to make clear the points to be registered by the author. In some instances they are imperative to proper understanding in others they are merely picturesque. The latter can be excluded to good effect, both as to space

and the not inconsiderable cost When illustrations are to be used they should accompany manuscripts and each should always be referred to in the text, preferably by number Drawings or graphs should not be larger than 12 × 16 inches, and must be made with jet black India ink on white paper Do not use typeuriter for littering The smallest lettering on 8 × 10 mch cops should be no less than 1/4 such high. Cross-section paper (white with black lines) may be used but should not have more than 4 lines per inch. If finer ruled paper is used, the major division lines should be drawn in with black ink, omitting the finer In the case of finely ruled paper, only blue-lined paper can be accepted Lettering and all markings must be large enough to be readable Mail rolled or flat, never fold after reduction Photographs should be very distinct and show clear ate contrasts They must be on glossy.

Avoid round and oval photographs black and white contrasts white paper

Whenever possible "crop" photographs, 1e mark portion that can be excluded when reproduced Crop marks should be on margin of photo-Do not run pencil lines through photographs. graphs

It is important to mark the top of the illustration on the back, also its number as referred to in the text, thus, Fig 1, 2, and the name and address of the author

Legends should be typewritten on one sheet of paper and attached to the illustrations

Clinicians agree that Schieffelin BENZE-STROL is a significant contribution to ther apy in that it is both estrogenically effective and singularly well tolerated, whether administered orally or parenterally

"In our hands it has proted to be an effective estrogen when administered either orolly or parenterally and much less toxic than diethylstil bestrol at the theropeutic levels (Talisman, M. R.—Am Jour Obstet & Gynec 46, 534, 1943)

"During the last two years I have used the new synthetic estrogen Benzestrol in patients in whom estrogenic theropy was indicated The results have been uniformly satisfactory' (Jaeger, A S Journal Indiana State Med. Assn 37, 117, 1944) Schieffelin BENZESTROL is indicated in all conditions for which estrogen therapy is ordinarily recommended and is available in tablets of 0.5, 1 0, 2 0 and 5 0 mg., in solution in 10 cc. vials, 5 mg per cc, and vaginal tablets of 0.5 mg strength

## WITH White's

SULFATHIAZOLE GUM,

in Oropharyngeal Infections

21.01.2.507 " The state of the

One tablet of White's Sulfathiazole Gum chewed for one-half to one hour

- 1 promptly provides a high salivary concentration of locally active (dissolved) sulfathiozole
- that is sustained throughout the chewing period in immediate contact with infected aropharyngeal mucosal surfaces,
- 3 yet even with maximal dasage, resulting blood levels of the drug remain so law as to be virtually negligible

INDICATIONS: Local treatment of sulfonamide-susceptible infections of oropharyngeal areas, acute tonsilities and pharyngitis, septic sore throat infectious gingivitis and stomatitis, acute Vincent's disease.

DOSAGE: One tablet chewed for one-half to

one hour at intervals of one to four hours depending upon the severity of the condition. If preferred, several tablets—rather than a single tablet—may be chewed successively during each desage period without significantly increasing the amount of sul fathlazole systemically absorbed.

Available in packages of 24 tablets, sanitaped in slip-sleeve prescription boxes.

IMPORTANT: Please note that your patient requires your prescription to obtain this product from the pharmacist.

#### Nutritional Deficiency IN HYPOCHROMIC ANEMIA

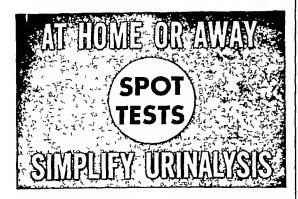

Patients with hypochromic anemia resulting from nutritional deficiences or blood loss exhibit one common feature With anemia once established, the ensu ing reduction of gastric acidity, lack of appetite, and increased fangability tend to decrease further the food intake, thus promoting or intensifying nutritional deficiencies and the progress of anemia

Hence anemic patients will be benefited most if not merely iron is supplied (usually but one of the deficient nutrieats), but also all the other factors which make for optimal iron absorption and ntilization, which lessen fatigability and increase the appetite.

Heptuna provides not only an adequate amount of highly available 110n but in addition, notable quantities of the fat solnble vitamins A and D, and the B-complex vitamins (partly derived from a vitamin rich liver extract and yeast)

# NO TEST TUBES · NO MEASURING NO BOILING

Diabetics welcome "Spot Tests" (ready to use dry reagents), because of the ease and simplicity m using No test tubes, no boiling, no measuring, just a little powder, a little urine—color reaction occurs at once if sugar or acctone is present

# Galatest

FOR DETECTION OF SUGAR IN THE URINE

# Acetone Test (DENCO)

FOR DETECTION OF ACETONE IN THE URINE

#### SAME SIMPLE TECHNIQUE FOR BOTH

descented for advantages as at. I

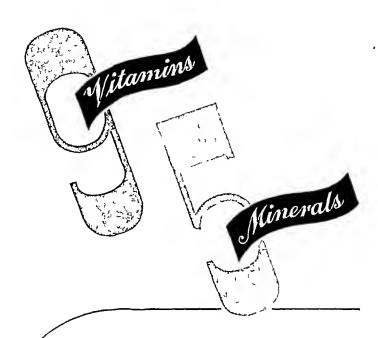

#### COLOR REACTION IMMEDIATELY

A carrying case containing one vial of Acetone Test (Denco) and one vial of Galatest is now available. This is very convenient for the medical bag or for the diabetic patient. The case also contains a medicine dropper and a Galatest color chart. This handy kit or refills of Acetone Test (Denco) and Galatest are obtainable at all prescription pharmacies and surgical supply houses

multivitamin mineral product best sulted to the requirements of modern medical practice and to the potient's preference for a conveniently administered preparation. It provides 9 vitamins and 5 minerals in a pleasantly flavored tablet which is willingly taken by children and adults—a tablet so palatable that it may be chewed. Available in bottles of 30,100, and 250. HOFFMANN LA ROCHE INC., Nutley 10, N. J.

VITAMINETS 'ROCHE'

# Why Libby's Baby Foods FOR EARLY INFANT FEEDING

The postulate that infant growth and development might well be favorably influenced if all essential nutrients—in adequate amounts—might be made available at the earliest date, in a form compatible with the infant's digestive apparatus, can hardly be gainsaid

Libby's Homogenized Baby Foods present a step in this direction. A definite advantage exists in making their contained nutrients available before certain prenatal stores, such as iron, are exhausted.

That Libby's Homogenized Baby Foods are well tolerated and that they may be fed safely and effectively as early as in the fifth week of life has been demonstrated by clinical investigations

> Libby, McNeill & Libby Chicago 9, Illinois

NOTE: IN CERTAIN AREAS, LIBBY'S HOMOGENIZED BABY FOODS ARE PACKED IN GLASS CONTAINERS

# *OMOGENIZED*

## THE RATIONALE OF LIBBY'S HOMOGENIZED FOODS

1 Luby's process of homogenium opens and disputes, releases contained nutriment, and disperses it homogeneously throughout, 2 Comminutes indigestible cell membranes 3. Exposes the nutrunent to the digestive

Jucces in a considerably increased surface area, thus facilitating digestion, Increases availability of the contained nutrienta, thus facilitating utilization,

5 Renders celluloso mechanically bland,

without impairing physiologic effect of bulk 6 Libby's Homogenized Baby Foods may

be fed as early as in the second month, pro De leu as carly as in the second month, pro prenatal stores are exhausted The smoother texture of these foods en

# LANTIN SODIUM

# ON ROL

Just as the modern dam keeps a raging river within bounds and prevents floods harnessing the forces of nature to productive octivity so modern epileptic therapy with DILANTIN SODIUM assists the body to control floods of nervous and mental excitement, reduces the number or severity of convulsive seizures, and enables the individual to lead a more normal, productive life

DILANTIN SODIUM (Diphenylhydontoin Sodium) is a modern opproach to epileptic therapy o superior anticonvulsant free from the undesirable effects of the bromides and borbiturates it is relatively free from hypnotic action and effective in many cases which fail to respond to other anticonvulsants With DILANTIN SODIUM the physician can secure complete control over seizures in a substantial number of cases and lengthen the intervals between seizures in others

## In the Activity of the Endocrine Glands

The depth to which protein permeates the fahric of meta bolic life, and the role it plays as "raw-material" and component of elaborated secretions is indicated in hormonal composition.

Thyroxine, the active principle of the thyroid gland, is an iodinated phenyl-ether derivative of the amino acid tyrosine Epinephrine, the active principle of the adrenal medulla, is also a tyrosine derivative. Insulin, as elaborated by the islands of Langerhans, has been isolated in crystalline form and found to be a protein

Only from the proteins of the foods eaten can the organism derive the protein substances required for these complex purposes

Among man's protein foods meat ranks high, not only because of the percentage of protein contained, but prin cipally because its protein is of highest biologic quality, applicable wherever protein is required

.. WITH SYNERGETIC ACTION

The potentiation of the central action of phenobarbital by the belladonna alkaloids (Friedberg, Arch f exp P & P CLX, 276) renders possible attainment of desired effects with relatively small doses, thus avoiding "hang over" and other unpleasant side-actions. In contrast to galenical preparations of belladonna, such as the tincture, Belbarb bas always the same proportion of the alkaloids.

Indications Neuroses, migraine, functional digestive and circulatory disturbances, vomiting of pregnancy, menopausal disturbances, hypertension, etc

Formula: Each tablet contains 1/2 grain phenobarbital and the three chief alkaloids, equivalent approximately to 8 minims of tincture of belladonna

Belbarb No 2 has the same alkaloidal content but 1/2 grain phenobarbital per tablet

## ANTIARTHRITIC MANAGEMENT

New chapter in the treatment of arthritis began ten years ago when the clinical administration of electrically activated vaporized ergosterol (Ertron) resulted in marked improvement of joint motility and in a general sense of well-being in arthritic patients

cases of arthritis under carefully controlled conditions in a number of leading arthritis clinics, universities, accredited hospitals and private practice

THAT Ertron produces noticeable subjective and measurable objective improvement in a significant number of cases of arthritis has been securely established

**TRONIZATION** of the arthritic is now a recognized and valued rt of the well-rounded program of antiarthritic management

ERTRONIZE—Employ Ertron in adequate dosage over a suffiintly long period to produce beneficial results. The usual produre is to start with 2 or 3 capsules daily, increasing the dosage of 1 capsule a day every three days until 6 capsules a day are wen. Maintain medication until maximum improvement ocirs. A glass of milk, three times daily following medication, advised

> Supplied in bottles of 50, 100 and 500 capsules Parenteral for supplementary intramuscular injection

> > ETHICALLY PROMOTED

#### A New Biologic Approach to Healing-

# CHLOROPHYLL THRRAPY

Announcing CHLORESIUM natural, non-toric Chlorophyllpreparations

The need for an effective, non toxic and non injurious thera peutic agent which accelerates healing by stimulating cell metabolism has been generally recognized The medical profession has viewed with interest this new and fundamental approach to the problem-the utilization of water soluble chlorophyll compounds.

The water soluble derivatives of chlorophyll "a" (CssH72OsN.Mg) have been extensively tested during the past four years in laboratory and clinic in the top ical treatment of wounds, battle muries, burns, ulcers and sim ilar lesions, especially the chron ic, indolent and resistant type.

#### Healing and Deodorization

Numerous investigators have demonstrated that these natural. non toxic chlorophyll prepara tions produce a definite, measurable acceleration of healing and a reduction of scar tissue. In addition, they report prompt climination of the almost un bearable odors found regularly in chronic appurative lesions of bone and other tissues

Now Generally Available

gation, these therapeutic chlorophyll preparations are now offered to the medical profession by the Rystan Company, under the trade name Chloresium

Both Chlorenum Solution (Plain) and Chloresium Oint ment contain the purified, thera pentically active water soluble derivatives of chlorophyll "a" (C., H., O. N. Mg) They are maintained to rigid chemical and physical standards and are pharmaceutically adjusted to a low surface tension to insure penetrability

#### Uso Widely Indicated

The topical use of Chloresium Solution (Plain) and Chloresium Outment is Indicated in a wide range of acute and chronic lesions, especially in the treatment of wounds, burns, ulcers, skin diseases, and malodorous lesions.

Chloresum is ethically promoted Available at all leading druggists

CHLORESIUM SOLUTION (PLAIN) 2 oz. and 8 oz bottles CHLORESIUM OINTHENT 1 oz. tubes and 4 oz. jars CHLORESIUM NASAL SOLUTION 36 oz. dropper bottles and 2 oz. and 8 oz. bottles

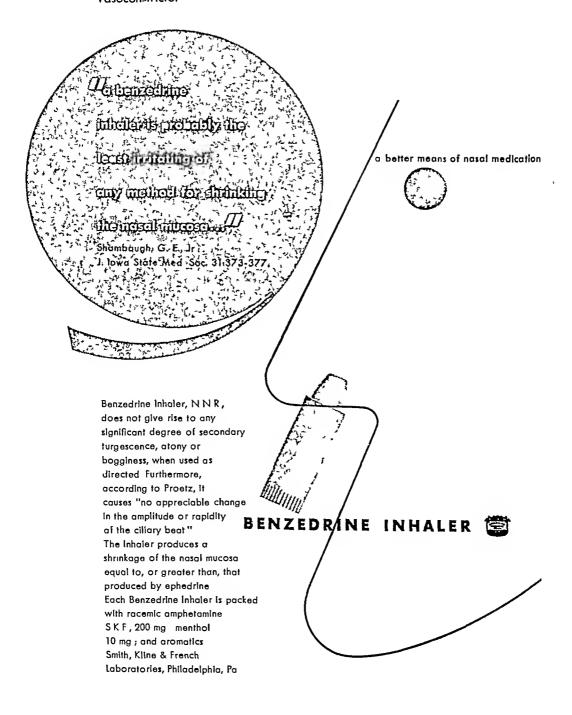

"Chlorosium Rosal Solution contains the particul, therapeutically active unter-soluble derivatives of chlorophysis" (LydinglyNyldy) in an increase askine solution askindly bettered for small manifestion. Indicated for symptomatic robot askindly bettered for any active robot askindly solutions of the appear respiratory to active and chronic fallonatory conditions of the appear respiratory to a

### ACIDOLATE

# "but, Doctor, I can't sleep!"

This is a statement that no physician fails to overlaok, because regular, adequate sleep is an important factor in the treatment of many clinical conditions.

Therefore, when a sedative is necessary, 'DELVINAL' sodium vinbarbital will provide a night of sound, restful sleep, in the majority of instances, with relative freedom from unpleasant side-effects of excitation or "hang-over."

'DELVINAL' sodium vinbarbital is a mild sedative and hypnotic that is characterized clinically by a safe therapeutic index, a relatively brief induction period and a moderate duration of action. In addition to its use for the relief of functional insamnia, it is also indicated in general sedation, in the production of preanesthetic hypnosis, psychiatric sedation, obstetric amnesia, and in pediatrics.

Council accepted, 'DELVINAL' sadium vinbarbital is a development of the Medical-Research Laboratories of Sharp & Dohme.

Supplied in dry-filled, colored capsules of three strengths: ½ grain (brown) in bottles of 100, 500, and 1000; 1½ grain (orange) in bottles of 25, 100, 500, and 1000; 3 grain (orange and brown) in bottles of 25, 100, 500, and 1000. Sharp & Dohme, Philadelphia 1, Pa.

#### Product of a common mold . but most uncommon care

The mold which produces penicillin is a mold of a fairly common variety but the production of penicillin for the medical profession depends upon precautions to insure sterility which are most uncommon.

One of the most important requirements of the finished penicillin is freedom from pyrogens. Each manufactured lot of PENICILLIN SCHENET is tested (as illustrated above) to insure utmost pyrogen freedom. When, in placing your order for penicillin, you specify PENICILLIN SCHENLET you may do so with confidence knowing that such measures of uncommon care assure a product of highest standards.

#### SCHENLEY LABORATORIES, INC.

"but, Doctor, I can't sleep!"

This is a statement that na physician fails ta averlaak, because regular, adequate sleep is an important factor in the treatment of many clinical canditions.

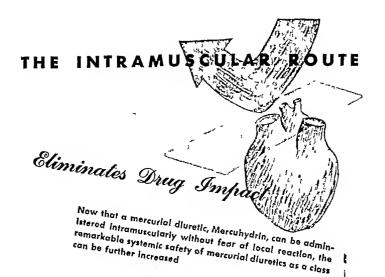

Therefare, when a sedative is necessary, 'DELVINAL' sodium vinbarbital will provide a night of sound, restful sleep, in the majority af instances, with relative freedam from unpleasant side-effects of excitation or "hang-over."

'DELVINAL' sodium vinbarbital is a mild sedative and hypnotic that is characterized clinically by a safe therapeutic index, a relatively brief induction period and a moderate duration of action. In addition to its use for the relief of functional insamnia, it is also indicated in general sedation, in the production of preanesthetic hypnosis, psychiatric sedation, obstetric amnesia, and in pediatrics.

Council accepted, 'DELVINAL' sadium vinbarbital is a development of the Medical-Research Laborataries of Sharp & Dohme.

Supplied in dry-filled, colored capsules of three strengths: ½ grain (brown) in bottles of 100, 500, and 1000; 1½ grain (orange) in bottles of 25, 100, 500, and 1000; 3 grain (orange and brown) in bottles of 25, 100, 500, and 1000. Sharp & Dohme, Philadelphia 1, Pa.

Because it is better tolerated locally, Mercuhy drin allows frequent administration by the intramuscular route for prolonged periods. Gradual absorption of the medication prevents sudden drug impact on conduction centers of the heart.

While it possesses definite advantage for in tramuscular administration, Mercuhydrin also may be given intravenously with the usual assurance. By either route it has demonstrated oustanding diuretic efficiency both as to quantity of urine excreted and duration of effect.

LAKESIDE LABORATORIES, Milwaukee, Wuconsin Mercubydrin is the sodium salt of methoxyonimercuripeopylsucdaylurea with theophylline. It is supplied in both 1 cc. and 2 cc. ampals.

Nercuhydrin

MERCURIAL DIURETIC

## POTENCY AND DEPTH OF COLOR IN PENICILLIN

Herwick, Welch, Putnam and Gamboa\* offer two important conclusions regarding the possibility of irritation after intramuscular injection of penicillin They are that:

- 1 An increase in potency in units per milligram of penicillin brings about a corresponding de crease in the pain produced, and
- 2. A correlation exists between the potency of penicillin and its light transmission

When you employ Cheplin Panicillin in your own practice you will find it:

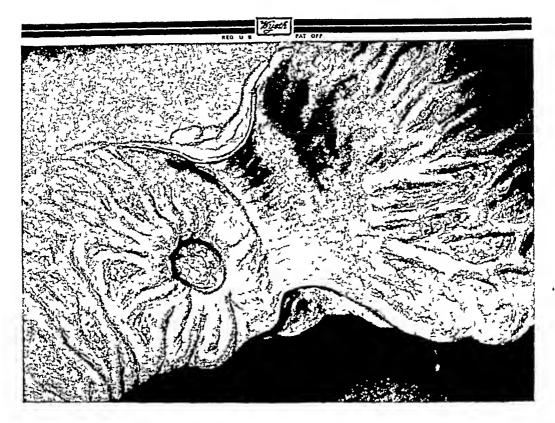

- 1 Uniformly high in potency per milligram and
- 2. Markedly light in color

Order Cheplin Panicillin through your physicians or hospital supply house.

## Thiouracil

Less than three years ago the goitrogenic and thyroid-inhibitory properties of thouracil were announced. Already many reports on its clinical use have been published and these reports show a remarkable unanimity of opinion. Final determination of its therapeutic value must await the study of later effects on patients but its present status seems to be fairly well established. Evaluation of the drug as a therapeutic agent is not more important than the determination of its limitations and the dangers inherent in its use.

Thiouracil inhibits the synthesis of the thyroid hormone. The resulting thyroid insufficiency stimulates the anterior pituitary to produce a compensatory but ineffectual hyperplasia of the secretory cells of the thyroid. This is clinically evidenced by a lowering of the hasal metabolic rate and a concomitant increase in the size and vascularity of the gland.

In most, but not all cases of hyperthyrodism the basal metabolic rate is slowly reduced to normal and, if administration is continued, a subnormal level with myxedema may be reached In this respect it is more effective than iodine and its preoperative administration has apparently eliminated the danger of postoperative thyroderises. The increased vascularity increases the difficulty of operation, but this can be avoided by discontinuing thiouracil and substituting iodine for a week or two before operation.

It has been shown that the basal metabolic response to thiouracil is most prompt in patients whose thyroids show the highest degree of hyperplasia and the least amount of stored colloid This accounts for the fact that the metabolic response is more rapid in untreated patients than in those who have been treated with iodine Longstanding goiters which have recently become toxic also show a slow response, and probably for the same reason Histologically, both groups show the presence of stored-up colloid. In these cases the use of thioursell should be continued until the desired metabolic level is reached even if this requires two or three months

Iodine usually produces an initial drop in

the basal metabolic rate, followed by a leveling off at a rate of perhaps plus 20 tinued administration does not usually produce any further drop On the contrary, the continued use of thiouracil effects a continuous drop to a normal or subnormal level This is illustrated by a case reported by the Massachusetts General Hospital group <sup>1</sup> A patient was receiving preoperative thiouracil treatment when the presence of dental abscesses necessitated postponement of the operation and consequent prolongation of In thirty days her basal metabolic rate dropped from plus 35 to minus 16 Operation was performed on the fortieth day Her thyroid was so hyperplastic that in some places the acmar structure was completely replaced by columns of epithelial cells The authors remark, "In this patient, after forty days of therapy, clinical myxedema coexisted with extreme histologic hyperplasia "

In connection with that explanation it is interesting to recall that at least thirty-five years ago Marine demonstrated extreme hyperplasia in the thyroids of cretin calves and also proved that iodine induced involution in hyperplastic goiters of dogs, antedating Plummer's discovery by a considerable time

Some enthusiasts envision the replacement of surgical treatment by the continued administration of thiouracil. Sufficient time has not elapsed to determine whether this is possible. Such treatment would seem to be more dangerous than operation because of the unpreventable toxic reactions produced by the drug. Furthermore, the anatomic result is a hyperplastic gland. Iodine, which induces involution, would seem to be a more logical choice.

Thiouracil may be the solution of the perplexing problem of persistent or recurrent [N Y State J M

All responded satisfactorily to thiouracil and no further surgery was necessary They express the opinion that this is one of the most helpful uses of the drug

The toxic reactions to thiouracil include agranulocytosis (sometimes fatal), drug fever, dermatitis of various kinds, swelling of the submaxillary salivary glands, arthritis, edema, vomiting, and jaundice apparently identical with the syndrome of postarsphenamine jaundice Gargill and Lesses<sup>3</sup> report such a case which lasted one hundred days Clute and Williams<sup>2</sup> suggest that the drug be given with great care to patients known to have any allergic symptoms They also warn against overdosage in patients manifesting malignant exophthalmos Five such patients became worse under thiouracil, but improvement followed the concurrent use of thyroid extract

It is to be hoped that from thiouracil some substance will be evolved which will be nontoxic and equally effective Until such a substitute is found it would be exceedingly dangerous to release the drug for general use For the present its greatest value seems to be in its use in preparing for operation patients with toxic goiters and especially in the preoperative treatment of patients who do not respond to or are allergic to iodine Its use as a substitute for total thyroidectomy in the treatment of angina pectoris has been reported by Raab 4 The results would seem to justify optimism and further experimentation

## Constructive Program for Medical Care

What is it? First, it is an answer to those who allege that the medical profession has no constructive program for inedical care, and, second, that legislation creating com-

pulsory sickness insurance is not the only or the most desirable solution

Who created it? The Council on Medical Service and Public Relations of the A.M.A.,

<sup>&</sup>lt;sup>1</sup> Moore, Francis D, et al. Ann Surg 120 2, 152 (Aug.)

toxicity after thyroidectomy Clute and Williams<sup>2</sup> treated fifteen such patients, some of whom had undergone two or three operations.

Clute Howard M, and Williams, Robert H. Ann. Surg.
 4, 504 (Oct.) 1944
 Gargil, Samuel L, and Lesses, Mark F J.A M A. 127

niceting with the Board of Trustees Tho program is stated clearly in fourteen para-

graphs 2

What does it do? It stresses the necessity for extending to all corners of this great country the availability of aids for diagnosis and treatment, so that dependency will be minimized and independence will be stimulated American private enterprise has won and is winning the greatest war in the world's Private enterprise and initiative manifested through research may conquer cancer, arthritis, and other as yet unconquered scourges of humankind Science, as history well demonstrates, prospers best when free and unshackled By it the Association supports improvement in nutrition, housing, and living conditions that are Again it fundamental to good health places the American Medical Association behind the extension of qualified public health and preventive medical service. The program recognizes that plans for insurance against the costs of hospitalization on a voluntary basis have now been sufficiently developed to warrant support, although some controversial questions have not yet been satisfactorily settled. The care of the indigent, for which there are no suitable provisions under existing or proposed national or other compulsory sickness insurance plans, may by new technics be incorporated into voluntary sickness insurance plans

So says the JAMA editorially, and comments further that Fundamental to a scientific plan for meeting needs for medical care is the scientific survey which determines the existence and scope of such needs. This fact is recognized in the proposals that surveys be made to determine these needs and that federal aid be given where needs are demonstrated, with the understanding that administration and control will be under local auspices. Scientific also is the proposal for continuous surveys of all plans leading toward their extension and improvement as new needs are shown

The final measures in this program relate to problems associated with the war and the situations created by military service. More than sixty thousand physicians have been involved in military and other government services, while less than ninety thousand physicians have tried to meet the needs of the civilian population. On these civilian physicians has rested a great burden

The needs of medical education have been told repeatedly and are again emphasized in this constructive program. Unless plans provide for a sufficient number of young men and women in the premedical curriculum, the nation will face a desperate shortage of physicians in coming years, a shortage made more acute by increased demands of the armed forces and of various government agencies for trained physicians. The needs of the Veterans Administration for physicians will far exceed any demands ever made previously by that agency

How does the program do it? The Council on Medical Service and Public Relations and the Trustees of the A.M.A sum up in these fourteen points what the physicians of the nation believe to be the best, the most practical, the scientific way of producing the best health condutions for the largest number

of people in this country

The physicians of the United States are interested in extending to all people in all communities the best possible medical care. The Constitution of the United States, the Bill of Rights, and the "American Way of Lafe" are diametrically opposed to regimentation or any form of totalitarianism According to available evidence in surveys, most of the American people are not interested in testing in the United States experiments in medical care which have already failed in regimented countries

The people of this nation must stand on their own feet, do their own thinking, survey their own requirements, and construct their own programs to meet those requirements. Here is the medical profession's constructive proposal for better medical care for more people. In practice, it has been in experimental operation for many years. Now it must be expanded. But it must be expanded but it must be expanded so that it will actually produce what it says it will. You cannot play fast and loose with anything as important as the health and lives of the American people. That is the continuing platform of the American physicians who know from ex-

<sup>&</sup>lt;sup>1</sup> June 16 1945. <sup>2</sup> J.A.M.A 128: 12, 883 (July 21) 1945.

perience what they are talking about Political parties come and go, laws are made and repealed or, what is worse, are unenforced, depressions follow inflation, promises are made and broken, and security may or may not be the desirable road from the cradle to the grave

But the better health of the American people is always the concern of the American

physician and of his medical associations whether at the local, the county, the state, or the national level—It is his ideal and his 'daily job to create it, with no favors asked, no strikes, no slowdowns, no political entanglements, and no compromise—The constructive program of the A M A. makes that thoroughly understood—American papers please copy

## Universal Maternity Aid

The attention of our readers is called to the bill introduced by Senator Claude Pepper recently, an outline of which will be found on page 1886 of this issue. When the Waitime Emergency Maternity Act was passed, this to expire with the termination of the present war, it was felt in many quarters that this might be a prelude to a more extensive application of free maternity care Evidently the fear was not groundless This costly and complicated measure demands careful study by the medical profession—its implications are manifold

We expect to present further comments on the measure in subsequent issues.

people of New York State, but in the hands of the

American Medical Association This assertion

is evidently based upon the fact that the Board

of Regents, for reasons good and sufficient to

themselves, and apparently to everyone else except Mr Ridder, have accepted as their own

guide the qualifications of the Council on Medical

Education and Hospitals of the A.M.A. for ap-

## Current Editorial Comment

## Of This And That

Dangerous Befuddlement Our good neighbor, New York Medicine, 1 takes up the cudgels against Mr Victor Ridder and his letter of May 3, 1945 to the Editor of the New York Times

"The enemies of racial intolerance and bigotry have enough real grievances to correct, and real causes to strive for, without having phoney causes manufactured for them...

"Mr Ridder took occasion to criticize Governor Dewey's action in vetoing bills passed hurriedly by the Legislature in its recent session, which would have required the Board of Regents of the Department of Education to admit for examination for medical licensure, graduates of unapproved medical schools. It should be noted, in passing, that not even the proponents of these bills urged them as a permanent measure, but stipulated that they should be enacted for the period of the national emergency in order to provide a greater number of licensed physicians to take care of the civilian public of New York State."

"Mr Ridder asserts, first, that the Department of Education of New York State is not in the hands of the elected representatives of the

 $\begin{array}{ccc} \text{part-} & \text{Ho} \\ \text{ot in} & \text{da} \\ \text{the} & \textbf{\textit{T}}_{2} \end{array}$ 

issue of racial tolerance into this matter, asserting that 'the real objection to this institution (Middlesev Medical College in Massachusetts) is that it has 80 per cent Jewish students and this does not accord with the quota of 3½ per cent which the American Medical Association has set for Jews throughout the country in the medical profession. Mr Ridder characterizes this alleged limitation policy of the AM.A as an example of Nazi tactics, and describes the

policy of the AMA as totalitarianism "Mr Ridder's statements are categorically answered in a letter by Dr Victor Johnson, secretary of the Council on Medical Education and Hospitals of the American Medical Association, dated May 10 and published in the New York Times for May 17 Referring to Mr Ridder's statement that the A.M.A. imposes a quota of

<sup>1</sup> Vol. 1, No 11, June 5, 1945, p 1

31/2 per cent of total enrollment for Jewish students in medical schools, Dr Johnson grants that if this statement were true it 'would constitute a serious indictment of the American Medical Association and its Council on Medical

Education and Hospitals ' "Fortunately," Dr Johnson asserts, "there is absolutely no foundation in fact for this irrespon aible statement The Council of the American Medical Association places no quota upon Jewish medical students, either at 31/2 or any other There is no such quota indicated in writing or by the spoken word, nor by implication, suggestion, mutual understanding, or any other kind of agreement.' Dr Johnson notes that the A.M.A. records do not indicate whether any given medical student is Jewish or not, and he states that 'the religion, creed, and nationality of the student are of insufficient interest to us to request such information from the medical The only concern of the Council on schools Medical Education and Hospitals of the American Medical Association is the qualification of the student for the study of medicine Race,

Semingly irresponsible charges of this sort from sources which could easily obtain the facts, should they choose to do so before bursting recklessly into print, is evidence, to us at least, of the evistence of organized propagands of a most dangerous and disturbing character. Why should an editor of Mr. Ridder's reputation, as Dr. Johnson points out, disseminate hearsay? Certainly, he could have checked the facts with the State Department of Education and with the A.M. A. Why did he not do so? The answer seems obvious He either wanted to believe what he wrote regardless of its correctness, or had been so convincingly "sold" that he believed his sources of

religion, creed, color, and sex are not among

these qualifications."

information were correct

In any event his communication to the Times is a splendid example of what to do to befuddle the public, bedoud the issue, and make everything worse for everybody

Dr Kirby Dwight, incoming president of the Medical Society of the County of New York said, in his inaugural address <sup>1</sup>

"There is need for more diagnostic clinics in connection with, and using the facilities of wellequipped hospitals to furnish diagnostic service at moderate cost," he said "The society has approved these clinics and has established the requirements for such approval.

"Let no one say that the medical profession has

no plan for medical security for nur patients. We strongly urge the public, especially the employees and employers of business and industrial enterprises, to avail themselves of the benefits of United Medical Service with the full assurance that this program, important as it is even now is actually nuly the first step toward o continually expanding and improving plan of medical protection for all the people."

Dr Dwight's reference to United Medical Service was timely On January 16 at a dinner at the Hotel Commodore, Dr William B Rawls, Chairman of the Coordinating Council of the five county medical societies of Greater Now York, said of the "Doctors' Plan" "The United Medical Service is quite properly introduced to the people of the New York Metropolitan Area, as the 'Doctors' Plan.' Organized medicine has not merely approved and endorsed this program—it has conceived it, fathered it, and nursed it. It's our baby, and we intend to bring it upl

"Now, in the medical picture today, there is one serious problem which everyone, doctor and patient alike, is agreed must be solved. That is the problem of the unpredictable, serious illness, the catastrophic illness that sometimes wipes out our hard-earned savings at one fell blow. Once every ten years the average person has a situation of this kind to meet, and the lack of any method of avoiding the economic consequences of such catastrophes has been the greatest cause of complaint against present-day medical economics.

"United Medical Service has aimed its arrow straight at the heart of this problem of the serious emergency illness. It has a much better than even chance of success in solving that problem. That is its immediate objective.

"Its ultimate purpose is to expand its scope of service, in the earliest future, and to enlarge its benefits, so that very soon it will offer a far more general protection for all kinds of medical needs. United Medical Service will follow the successful example of its working partner, Associated Hospital Service. It will start on a sound, limited basis, and, as it grows in size and public favor, it will expand logically—and, we hope, rapidly—to meet every reasonable need for protection against the cost of medical care.

"Our study of medical insurance plans in all parts of the United States makes us absolutely confident that such a plan as the United Medical Service offers will succeed "Let me point out a very important fact United Medical Service—as insurance—has no income limitation at all. It is available as a service plan to families earning \$2,500 or less, and to those earning over \$2,500 it is available as insurance—as an indemnity policy, offering specific financial assistance toward the payment of surgical and obstetric expenses. In addition, the surgical and obstetric fees charged to families with incomes from \$2,500 to \$3,500 will be subject to review in any case where the patient feels they are unfair.

"We should like, finally, to emphasize the historic fact that the medical profession in New York City has fostered this development from its very inception, and, contrary to the impressions one might gain from some sources, we have been the pushers—not the pushed—in bringing the idea of medical care insurance to fruition"

Dr Conrad Berens, retiring president of the Medical Society of the County of New

York, said in part

1854

"If the Government takes over the operation of medical service, then the art of medicine, as distinguished from the science of medicine, would disappear" Scientific medicine would remain, but science, indispensable as it is, is not enough for human beings with their fears, preferences, prejudices, problems, and mental blind spots"

In line with Dr Berens' thought we read

that in Chicago the dean of the University of Chicago's division of physical sciences<sup>2</sup> said

"The United States is 'iii danger of scientific bankruptcy' because practically all training of young scientists has been halted, declares Professor Arthur H Compton, Nobel Prize winner and dean of the division of physical sciences, in a statement issued last week by the University of Chicago If the training were resumed now it would take six years to train eighteen-year-old students so that they would be competent to engage in research work,' he pointed out 'If the war should continue for as long as it has already been fought, our present policy of no advanced training will spell national disaster,' Dr Compton declared"

Presumably it will take some time for this nation to utilize, after the war, all the scientific discoveries now cloaked in secrecy. To adapt these to the purposes of peace and to spread knowledge of their use will not be the work of a moment. We advocate advanced training and more advanced training for our medical students, deceleration of college courses where the national safety permits, and we are not too worned about "scientific bankruptcy". The size of the national debt at times admittedly wornes us. But that is only financial, not scientific, bankruptcy

1 January 23, 1945

New York Herald Tribune, Jan 28, 1946, p 12, Sec II

## Important Notice

ALL physicians treating compensation patients are required to file (with the Linsurance carrier or employer and the Workmen's Compensation Board of the Department of Labor) certain forms—C-104 within forty-eight hours, C-4 within fifteen days, etc. One copy should be kept for the doctor's file. The C-4 form should be notarized to avoid unnecessary appearances by the physician before the referee. C-14 forms should be filed every month in all protracted cases, even though not requested by the employer or insurance carrier.

Do not fail to ask *in writing* for *authorization* to give physical therapy treatments in excess of \$25 where such treatments are indicated and necessary This may be done on the C-14 progress report or on the doctor's letterhead

All specialists examining cases for attending physicians or in consultation are required to submit a full and detailed report on their letterhead to the employer or insurance carrier, the Department of Labor, and the referring physician—If the specialist takes over treatment of a case he should also file the necessary C-104 and C-4 and other reports as required of the attending physician

Greater attention to prompt and complete reporting will be of material advantage to the physician and of aid in prompt compensation payments to injured workers

## INCIDENCE OF CARDITIS IN RHEUMATOID ARTHRITIS

WILLIAM FEIRING, CAPT, (MC)\*

(From the A.A F Regional Station Hospital, Orlando Florida)

THE concept that rheumatic fever and rheumaticid arthritis are independent clinical entities has not been universally accepted. If typical cases of each disease alone be considered, the diagnosis and differentiation do not present serious difficulties and the rigidity of the traditional nomenclature appears to be supported. When, however, patients are observed in whom chronic joint changes are attended by carditis, the separation of rheumatoid arthritis from rheumatic fever as distinct and sharply isolated discases becomes controversial

On the assumption that each disease exhibits a pattern that is clearly identifiable, it has been predicated that the existence of rheumatic beart disease in the presence of rheumatoid joint changes is a casual coincidence. Indeed, this is the commonly accepted explanation 1 On the other hand, the many striking clinical and pathelogic similarities of these disease processes has suggested that their coexistence may signify a causal relationship. It has been implied that carditis in the presence of chronic rheumateid arthritis may be the result of an antedating rhoumatic infection 22 Evidence that the association can be traceable to such a sequence, however, is not always available or applicable, for the variations of onset in either illness are numerous and too often similar. The acute polyarticular inflammatory phenomena that berald the appearance of rheumatic fever may be the identical expressions of rheumatoid arthritis. It has also been postulated that rheumatoid arthritis can be attended by an inflammatory carditis, the clinical and pathologic appearance of which resembles rheumatic carditis, although the causative agents are independent of each other This concept bas appeared unconvincing and difficult to accept.4 And, last, it has been considered that rheumatoid arthritis and rheumatio fever are related and that the cardiao involvement in either is a manifestation of a common pathogenesis Whichever concept may be accepted, it becomes readily apparent that nosologio categorization is difficult and debatable. Scientific classification of disease necessitates the establishment of critena that are sharp, specific, and discriminating In consideration of the many common phenomena and the close pathologic and immunologic amilarities, bowever, separation of rheumatic fever and rhoumatoid arthritis becomes, at best, imperfect.

\* Of Richmond Hill New York.

Observations on the clinical detection of carditis in patients afflicted with chronic arthritis have varied Boas and Rifkin reviewed 80 cases of arthritis deformans and reported recognizable valvular disease in 14 (17 5 per cent) Contes<sup>6</sup> stated that the incidence of carditis in 300 cases of rheumatoid arthritis was 4 per cent. Master and Jaffo<sup>7 \$</sup> found normal electrocardiographic tracings in all of their cases of rheumatoid arthri tis and concluded that heart disease was not a manifestation of the rbeumatold process. Three hundred and fifty cases of chronic arthritis were studied by Wetherby and of these, only 7 (2) per cent) manifested definite rheumatic heart disease. It is noteworthy that in 32 patients of this series the onset of the disease was of an acute febrile nature and of the latter, 6 patients (187 per cent) revealed definite rheumatic heart involvement. Unequivocal signs of cardiac disturbances were found in 7 per cent of the cases observed by Dawson and Tyson. 16 These investigators cited Fischer's statistical account of the cardiae implication in rheumatold arthritis in the "primary" form, 4 per cent of the cases showed this association, in the "secondary" form the frequency was 65 per cent. The more frequent occurrence of the "secondary" form appeared to parallel the experiences encountered by Wetherby An incidence of 4 per cent of rbeumatio carditis in rheumatold arthritics was reported in Monroe a review 11 Bayles and Mc-Ginn12 are quoted as having found 5 per cent of cardiac complications in 100 consecutive cases of rbeumatoid arthritis Seventeen per cent of Bayles' case studies had clinical aigns of heart disease antemortem

Pathologic studies disclosed a contrasting higher incidence of rheumatic heart disease in subjects afflicted with rheumatoid joint disturbances. In the series etudied by Bagenstoss and Rosenberg,19 56 per cent of the patients who died with characteristic lesions of a rheumatoid arthritis showed cardiac alterations identical with those of rheumatic fever Aschoff nodules in various stages of development were observed in the myocardium, valvular leaflets, pericardlum, and aorts. Yet, only one half of these cases disclosed sufficient clinical criteria to warrant the diagnosis of cardiac disease during life. Bayles' postmortem studies11 showed that 22 per cent of rheumatoid arthritics were afflicted with rheumatic carditis The frequency of these cardiao changes was similar in arthritics presenting the usual rheumatoid type as in those with Still's disease or the Marie-Strümpell form Young and Schwedel<sup>14</sup> completed clinicopathologic investigations in 38 patients and were assured that 25 (657 per cent) exhibited unquestionable heart disease The cardiac involvement in the "primary" and "secondary" forms of chronic polyarthritis were comparable in nature, frequency, and extent of the pathologic process, the pericardium and endocardium were frequent sites of similar inflammatory invasion Out of 25 cases of rheumatoid arthritis upon which necropsy examinations were made, Fingerman<sup>15</sup> found 8 (32 per cent) that had rheumatic heart lesions Three of these presented a combination of lesions known as Felty's syndrome The frequency of the association of rheumatic carditis and rheumatoid arthritis is striking and should dispel perplexity caused by the common clinical display of features of both diseases

In a recent review at this hospital of more than 100 cases of rheumatic fever, 27 disclosed adequate evidence that chronic joint changes dominated the clinical picture In these patients, localized pain, swelling, periarticular atrophy, disability, restricted joint motion, and deformity acteristically indicated an inexorably progressive joint invasion, notwithstanding the abrupt or insidious onset of the disease. In several, the course was marked by recurrent acute exacerbations of polyarthritis out of which chronic rheumatoid disease evolved In 8 cases, however, observations led to the reasonable assumption that heart disorders accompanied or followed the appearance of the stigmata of rheumatoid arthri-One patient (excluded from this study) showed questionable heart disease insofar as a persistent loud systolic murmur and recurrent premature ventricular contractions were the only manifestations discerned over a period of several Detection of cardiac involvement depended upon morphologic alterations that were displayed clinically or roentgenographically, and upon electrocardiographic abberations The patients that were studied in this series were men between the ages of 19 and 36 years In none did congestive failure, visceral infarction, subacute bacterial endocarditis, or sudden death complicate the picture

## Case Reports

Case 1—A 31-year-old white man was admitted in October, 1944, three weeks after the onset of an acute severe tonsillitis, for acute polyarthritis involving the right knee and right great toe. In 1938 he was incapacitated by an attack of rheumatic fever which lasted six months. During the summer of 1939 he suffered with stiffness of the joints in

the hips and lower extremities. After admission an elevated temperature between 100 and 102 F, attended by tachycardia, appeared and persisted for three days. This was promptly lowered by salicylate administration. An exaggerated apical thrust, a systolic and diastolic apical murmur, and an elevated sedimentation rate were observed. The cardiac silhouette, the blood counts, and the electrocardiographs, except for low amplitude of the QR-S complexes, were normal. The slightest exertion produced prolonged tachycardia, palpitation, and dyspnea.

In January, 1945, he reported the appearance of a pale, slightly tender swelling about the proximal interphalangeal joint of the right fourth finger, unaccompanied by other acute manifestations. A grade II systolic apical murmur which transmitted to the axilla became audible, but this was preceded by a blowing diastolic murmur along the left sternal border. The blood pressure was 150/80. Simultaneously the right shoulder joint developed stiffness and limitation of motion, so that abduction failed to

exceed 45 degrees Examination in February after hospital transfer confirmed the presence of the aortic diastolic mur-Apical systolic and presystolic murmurs became audible, a Corrigan pulse was found, and the The sedimentablood pressure measured 156/92 tion rates and other laboratory findings were within The cardiac silhouette failed to disnormal range close any enlargement or change in contour proximal interphalangeal joints of the third and fourth fingers of both hands were swollen, fusiform in contour, and incompletely flexed Abduction at the right shoulder slowly improved and could be carried to an angle of 60 degrees

Case 3 -A 23-year-old man was admitted in February, 1944, for gradually increasing pain and swelling of the right knee without fever or leuko-During the first week migration of the joint invasions occurred and an apical systolic murmur became audible Response of the arthritis to salicylates was rapid but the sedimentation rate remained elevated for one month Hospital transfer was effected in June and the course thereafter was marked by continual complaints of residual stiffness in various joints An apical, low-pitched, diastolic murmur became an additional finding. This was constant after its appearance Response to salicylates was not forthcoming and in August the right knee became painful, increasingly swollen, and resisted weight bearing Roentgenographic The diastolic changes could not be demonstrated and systolic murmurs and the progressive monarticular arthritis persisted unchanged.

Case 3—A 33-year-old man was admitted in November, 1944, for fever, fatigability, loss of weight, and dyspnes Since the age of 20 he had suffered irregularly recurring aching, swelling, and disability of the shoulders and hips Two years prior to admission, pain in the left shoulder prohibited the raising of the arm From December, 1943, to March, 1944, he was hospitalized for an undetermined fever. In June, 1944, a frank inflammation enveloped the right big toe for three weeks and migrated to the right ankle and foot about

Fig 1a

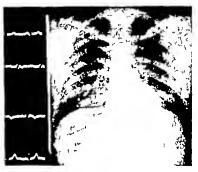

Fto 1b

one month later After admission a three-day bout of fever appeared. The cardiac findings were negative, but electrocardiographic tracings taken shortly after admission revealed inverted T waves in leads II, III, CF2, and CF4 (Fig 1a). The right ankle and the dorsum of the right foot appeared swellen, tender, and red, and motion of the involved mem ber was deededly limited. The left shoulder revealed on abnormally wide range of motion in all directions, and atrophy of the musculature about the left scapula, shoulder, and arm was marked.

Ho appeared as a debilitated, pale, underweight patient for re-examination in December, 1944 Atrophy about the left shoulder, voluntary subitation, and flaring of the left ecapula were prominent Tenderness and swelling were present over the dorsum of the right foot. The laboratory findings were cogative and the T waves gradually returned to the upright position in all leads. Yeary films showed mild esteoporcess of the bones of the right foot and punched-out areas involving the end of the first phalanx of the right great toe (Fig. 1b) No response to salicylates was effected. Supportivo treatment and local radiant heat and massage gave rise to a satisfactorily improved condition so that discharge was emeeted fo February, 1945

Case 4 -A 37-year-old man was admitted in January, 1945 for etiffness and pains in the left knee, right ankle and the proximal interphalangeal joints of the third and fourth fingers of both hands. Pale swelling was present over the knees, and the involved joints of the fingers were visibly spindled. Physical examination failed to disclose any cardiac abnormalities. The blood pressure was 128/88 Both hands felt clammy and cold and the hyperthenar and thenar eminences appeared erythema tous. Response to salicylates was poor in spite of plasma levels that were sustained above 28 mg, per cent. Roentgenograms of the heart were normal and the electrocardiographic changes were marked by left axis deviation and T-wave inversions in leads H and HI (Fig 2) All other laboratory phenomena were normal. In March the same objective phenomena were unaltered but the electrocardiographic findings reverted to cormal. X-ray films of the hands showed demineralization (Fig. 3)

Case 5—A 20-year-old soldier was admitted in May, 1944, complaining of persistent joint pains

Fto 2

about the knees, shoulders, and hands. At the age of 22 he had been confined to bed for a period of three months for migratory joiot pains full recovery he returned to work about six months after the onset of the illness. He remained asymptomatic until Jaouary, 1943, when he sensed painful swellings of the fingers of both hands In August of the same year the left knee became swellen and painful and weight bearing difficult. This was accompanied by pains io the shoulders, hands, and knees which persisted until admissioo The course thereafter was marked by the following phenomena constant paio, swelling, and migration of joint inflammation without a satisfactory response to salicylates, a floctuating PR interval between 17 seconds and 22 seconds floetuating but con stantiy elevated sedimentation rates, persistent funform swelling and an extensor deformity of the proximal interphalangeal joints, succeeding swelling of the second and third right metacarpophalangeal joints and gradually increasing interesseous atrophy of the dorsum of both hands. Discharge from the service was effected in January, 1945, while these findings persisted.

Case 6 -A colored 31-year-old soldier was observed from August, 1944, for migratory joint swellings, manifested by pain, redness and failure to respond to salleylates. Cardiac examination was entirely negative, but the electrocardiographic tracings revealed a PR interval of .20 seconds with pulse rates varying between 96 and 104 Persistent swelling involved the proximal interphalangeal joints of the second, third, and fourth fingers of both hands. Previous history indicated that growing parus had appeared at the age of 12 and had been followed by migratory joint pains with various joint swellings at the ages of 15, 18, and 29 years Spontaneous remissions occurred after several months duration on each occasion. Transfer for convalescence was effected in September, 1944 Tho first three days were marked by a rise in temperature, the maximum being 102, and an elevation of the pulse between 100 and 112 The sedimenta-

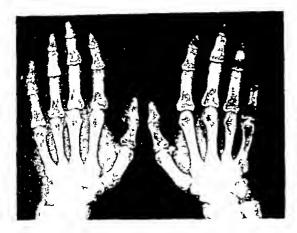

Fig 3

tion rate was increased, leukocytosis was present, and repeated nontraumatic nosebleeds occurred Cardiac examination was negative except for a blood pressure of 120–164/80–110. Tenderness, swelling, and diminished motion of the fingers at the proximal interphalangeal joints persisted throughout the course. Salicylate therapy in dosage of 10 Gm daily for a period of three weeks failed to cause any response. On discharge in December, 1944, the PR intervals had diminished to 17 seconds with pulse rates between 76 and 92.

Case 7 -A 20-year-old man without an antecedent respiratory infection was admitted in March, 1945, for stiffness, progressive swelling, pain, and mability to extend or bear weight on the left There were no stigmata of rheumatic fever On the day following admission in the past history a swollen left wrist developed and the temperature clevated to 1024 F Tho common phenomena of acute arthritis were present over both joint sites With salicylates, resolution of the inflamed wrist occurred, but only after heat and massage were administered could extension of the left knee be exe-A recurrence of the left-wrist involvement appeared on the sixth day of hospitalization in spite of continued salicylate ingestion The sedimentation rate was elevated, the white blood count was normal, but the electrocardiogram revealed a right bundle-branch block Re-examination in April after transfer disclosed a rigidly flexed, painful, and swollen left knee Clinical examination of the heart failed to account for any abnormalities, but the right bundle-branch block appeared on the electrocardiographic tracings (Fig 4) X-ray films of the chest, heart, knees, and wrists were normal but the scdimentation rates remained rapid Heat, massage, and careful exercise improved the local condition of the left knee

Case 8—A 19-year-old man was admitted in July, 1944, for recurrent joint pains and swellings of the right elbow and knee, and a coincident fever of five days' duration—At the age of 13 he had been confined to bed for a few months for rheumatic fever and again, at 14 years, had been treated for five months for fever and migratory polyarthritis that

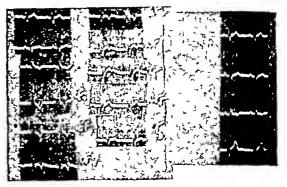

Fig 4

involved the shoulders, elbows, and wrists A heart murmur succeeded the arthritis and restriction from activities during high-school attendance was enforced Aching and stiffness had recurred during inclement weather since the age of 15, but the murmur was not detected at the time of induction into the service

Pain and swelling of the right knee recurred in The response to rest and salicylates March, 1944 was satisfactory although vague aching continued In May, 1944, pain and increasing stiffness of the knees followed periods of physical activity, and therapy was pursued in the form of heat and mas-Re-examination in August, 1944, failed to disclose any positive findings to account for the complaints of continued pain and stiffness of both knees and clows Sedimentation rates were conspicuously elevated for twelve weeks and after that were found at upper borderline levels The swelling, disability, and painful weight bearing of the right knee continued to March, 1945, although roentgenograms of the joint wore not abnormal in appear-Chincal examination of the heart and electrocardiographic tracings disclosed normal findings The transverse diameter of the cardiac silhouette in July, 1944 measured 106 mm, but in March, 1945 the transverse diameter was 123 mm

## Discussion

The incidence and the nature of the cardiac manifestations in this selected series contribute to the perceived relationship between rheumatic fever and rheumatoid arthritis Cardiac abnormalities were detected in 8 of the 27 patients that came under observation—an incidence of over 29 per cent Although these patients were all young adults in whom the chances of cardiac involvement were greater, the incidence of carditis was higher than that disclosed by other The abnormal cardiac phenomena were of three types In cases 1 and 2, unequivocal auscultatory signs led to the diagnosis of heart disease In cases 3, 4, 5, 6, and 7, the electrocardiographic recordings alone implicated the heart Whereas other authors7,8 could not identify any specific aberrations in serial electrocardiograms taken on subjects with rheumatold arthritis, analysis of the cases reported by Young and Schwedel14 indicated that abnormal tracings were not uncommon In the last case, 8, advancing size of the transverse diameter was the only evidence that the myocardium was involved in the disease process.

Although recent pathologic investigations have attempted to amplify the differentiating microscopic features in rheumatic fever and rheumatoid arthritis, conclusive evidence that cytologic differences exist has yet to be presented. Of particular interest have been the studies on the subcutaneous nodules Collins16 observed that the degree of vascular proliferation and polymorphonuclear invasion was much greater in rheu matic fever, whereas fool of necrosis were larger in rheumatoid arthritis. In the latter disease, the fibroblastic reaction around the necrotic foci was decidedly more pronounced. While admitting that the elements compoung the structure of the subcutaneous nodules in the two diseases were similar, the chronologic sequence and progression of these alterations proved adequate histologic criteria for differentiation The second comparative study17 emphasized that, although it was possible to distinguish the nodule of rheumstold arthritis from that of rheumatic fever, similar or Identical cytologic features were common to both diseases Differentiation of the lesions was achieved only because one or more of the pathologio variations predominated Dawson<sup>13</sup> concluded that the characteristics of the nodules in the two diseases revealed similarities that represent different phases of the same fundamental McEwen's19 supravital pathologic process. stains of cells composing the subcutaneous nedules of both diseases indicated that essentially they were alike. Other authors,4 12-16,20 have examined the hearts of chronic arthritics afflicted with carditis and found, significantly enough, that the lesions were indistinguishable from those of rheumatic fever Included in the anatomic observations which served to mark the identity of the pathologic process were typical Aschoff nodules discovered in the valves, pericardium, and myocardium. Young and Schwedel14 reported that the qualitative and quantitative changes in the cardiac structures were alike in severity and extent. The same view was taken with regard to the structural differences of the subcutaneous nodules examined in cases of both diseases, fundamentally, the cytologic structure was the same and the differences were of degree and not of kind

The close relationship between the two diseases can be further appreciated by consideration of the factors which equally influence their appearance and evolution. Dawson and Tyson to and Monroe<sup>11</sup> have focused attention upon the familial ineidence, the geographic distribution, the initiating factors, the seasonal effects, the age incidence, and the clinical manifestations of the two diseases in different age periods, the pathologic similarities. and the similar immunologic findings

The clinical studies and pathologic findings lend support to the growing conviction that sharp and recognizable differences do not exist between the two diseases Because the symptomatology overlaps, the same anatomic elements of the orgamsons are affected, and the same morbid phenomena are expressed, the association appears to be more than sumply fortuitous. In fact, the striking and identical features common to both diseases prompts serious consideration of Charcot's premise<sup>11</sup> that, fundamentally, both diseases are different clinical reflections of the same diathe-The statistics invite careful consideration of this comprehensive and spectral view. The degree to which variously involved tissues respond to an inciting agent and the variability of that response, identified as the rheumatic etate. are of the greatest fundamental importance

#### Summary

An incidence of 29 per cent of carditis in 27 cases of rheumatoid arthritis is reported and the history and course of 8 patients are described

The abnormal cardiac phenomena were of three types In the first 2 cases unequivocal auscultatory signs led to the diagnosis of valvular disease. In 5, electrocardiographic recordings alone implicated the heart. In the last case, advancing size in the transverse diameter was the only evidence that the heart was affected during the course of the illness

Attention is directed to the perceived relationship between rheumatic fever and rheumatoid arthritz.

## THE CONQUEST OF SMALLPOX

At last it seems that our country is about to join the ranks of the nations that have eradicated small-Only 384 cases of this loathsome disease were reported in the United States during 1944 This is less than half the previous low record established the year before In the area stretching from Maine to Maryland, there was not a single case last year, one western state, Utah, also had a perfect record In all, twelve states and the District of Columbia which include more than one quarter of the total population of the country, were completely free of smallpox in 1944. Twenty-two states reported less than 5 cases per million population. The largest number of cases, in Indiana, was only 38 As recently as 1940 Minnesota and Iowa each had more cases than were recorded in the entire country last year

In 1921, when figures for the country as a whole began to be fairly complete, there were about 109,000 cases of the disease reported in the United States In that year thirty-one states each reported in excess of 1,000 cases, one state running above 9,000 In the next largest epidemic year, 1924, the number of cases was close to 57,000 somewhat lower peak is recorded for 1930, when nearly 50,000 cases were reported. The most recent upswing in smallpox culminated in 1938, with 15,000 cases that year Since then the trend has been steadily downward, with the result that the disease is now near the vanishing point

It is difficult for the present generation to realize the dread with which this disease was once regarded We need go back less than 75 years to see the reason for this attitude Figures for the entire country are not available for that period, but the records of certain of the large cities are striking In New York City, for example, in the epidemic year 1872, deaths attributed to smallpox were equivalent to a rate of 113 per 100,000 population. In Chicago, that year, the smallpox death rate was 193 per 100,000, Boston's rate was 270, and Philadelphia's 365 In Baltimore, during the twelve months from April,

1872, to March, 1873, the smallpox death rate averaged 504 per 100,000 Rates almost as high were reported by these cities in outbreaks during the 80's New Orleans, which had long been a breeding spot for smallpox, in 1883 recorded an almost unbelievably high mortality rate from the disease—565 per 100,000 This is about twice the current national death rate from cancer, tuberculosis, pneumonia, and accidents combined

The pity is that all this sacrifice of life could have been avoided as easily at that time as at present, since the efficacy of vaccination as a preventive of smallpox had been well established long before 1872 Proof of this statement is supplied by the experience of Providence, Rhode Island, where vaccination against smallpox has been a requirement for school attendance since 1856 quently, during the widespread epidemic of 1872-1873, the city's death rate from the disease was only 17 per 100,000—a very small fraction of that recorded by other leading cities of the period, as indicated by the series of figures cited above

It is to be hoped that the present favorable situation will not lead to a feeling of complacency and indifference to the need for constant watchfulness against this dread disease, with the consequent neglect of the simple preventive procedure of vaccination and revaccination If this should occur a large nonimmune population will be built up, providing a fertile field for widespread epidemics and a resurgence of the disease in future years cent experience of Pennsylvania should be a constant reminder of the danger inherent in an unprotected population. Only 2 cases had been reported in that stage between 1932 and November, 1942 In that month this splendid record was badly shattered when a woman from Ohio with a mild case of smallpox visited an unvaccinated community of Amish people in Lancaster County a direct result, 65 cases were recorded before the epidemic was brought under control—Statistical Bulleim, May, 1945

## GOING UP

The proprietor of a highly successful optical shop was instructing his son, newly entered in the business.

on how to go about charging a customer "Son," he said, "after you have fitted the customer with glasses, and he asks what the charge will be, you say, "The charge is \$10' Then pause and wait and see if he flinches

"If the customer doesn't flinch, you then say, That's for the frames The lenses will be another \$10,

"Then you pause again, this time only slightly, and watch for the flinch.

"If the customer doesn't flinch this time, you say, firmly, 'Each'"-Clin Med, May, 1945

## VITAMIN E IN THE TREATMENT OF MYOPATHIES

Preliminary Reports on Its Topical Use in Fibrositis

Morris Ant, M.D , Brooklyn, New York

(From the Bethel Hospital Service)

EVANS,¹ one of the pioneers in the experimental work connected with vitamin E and muscle, stated that medicine has "remained awestruck and bewildered in the presence of diseases ravaging the muscles, the physician only too often being no more than a belpless onlooker watching the progressive course of deterioration." The truth of the above statement becomes apparent upon contemplation of the wide range of treatments recommended for the myopathies and diseases of connective tissue. Depending upon the proposed cause in given instances, these patients are treated with enforced rest, various kinds of physical therapy, fever therapy, beliotherapy, vaccines and foreign proteins, removal of foci of infections, duet, analgesics, etc.

The multiplicity of methods used gives evidence of the insufficiency of any one measure, for no specific therapy is yet known. The disability and often morbidity associated with myalgia and fibrositis is nevertheless spalling Evans and Burr, in 1928, first pointed out the apparent relationship between vitamin E and paralysis (with spasticity and muscular atrophy) in the sucking young of vitamin-E-depleted rate. This work was followed by reports of numerous other outstanding investigators, such as Ringsted, Goottsch and Pappenheimer, Mackenzie, and McCollum, and others who have elucidated other aspects of the same problem.

Results from experimental work in the years since 1928 have pointed to the possibility of a nutritional cause, I e., that maintration resulting from an insufficient intake of vitamin E may be involved in certain diseases of the muscular and nervous systems. It was pointed out that the pathology caused by a vitamin-E deficiency consisted of degenerative changes in the nervous system and the skeletal musculature, which becomes progressive to the point of affecting the spinal cord and resulting in muscular atrophy and degeneration. The buman analogues of these changes in animals are tabes dorsalis, progressive spinal muscular atrophy, and probably such systemic diseases as anemia. Further, the rate of musclo degeneration resembles histologically the pathologic picture of buman muscular dystrophy This corollary was applied to buman studies by the investigators, to whom the paraliel was apparent. In that connection we find the works of Bicknell, Blakeslee, Mahoney, Wechsler, Stone, 10, and Sutro and Cohen 11 Many of them have reported remission of symptoms in muscular dystrophies, with relief of pain, swelling, and stiffness, with increase of the extent of mobility and therefore a better sense of wellbeing

## Results of Vitamin E Therapy in Fibrositis

While following the development of the vast hterature on the use of vitamin-E therapy in the various myopathies, which really embrace many clinical entities, our attention since 1937 has been particularly directed to cases of fibronius

Fibrositis, like other myopathies, is being increasingly viewed as being of metabolic rather than infectious cause The pathology involved in fibroutis is construed as an ischemic necrous which affects the ganglion cells and results in edema and bemorrhage The picture of circulatory blockage as the cause of the lesion injects Itself bere Necrosis of muscle tissue would seem to occur by the ingress of water, either through esmosis or by passive congestion, causing local edema of the sarcostyles and, secondarily, of the muscle fiber This edema is not amenable to treatment by diuretics The myogenio factor. rather than neurogenic control, would appear to be the responsible factor For, if this physiclogic regression and resulting pathology were primarily of neurogenic origin, the end result of the disability would be paralysis and atrophy Patent pathways, as evidenced by successful nervous stimulation, galvanic or otherwise, verify the belief that atrophy, if such coexists with immobility, is not neurogenic, but a myophysical change due to local mainutration. The reversability of these changes and the manner in which vitamin E affects them have been clarified by Goettsch and Pappenheimer 4

Observation shows that the salubrious results obtained by the use of vitamin E in relieving tension and tautness appear to be due to the relaxing effects of the vitamin upon the sarcestyles and muscle fibre. This relaxing effect is the exact antithesis of that achieved through the use of countertritants and rubefacients, which favor rigor caloris, considered by many physiologists to be a spartic condition. By merely causing a return of blood to the locus, these older therapies do not rectify the ischema. There appears to be evidence that vitamin E in the form of wheat

TABLE 1 -SUMMARY OF CASES TREATED BY THE TOPICAL USE OF VITAMIN-E OINTMENT

Patient's Initials	Sex	Age	Duration of Symptoms	Location of Fibrositis	Type of Therapy and How Long Administered	Effect of Treatment
F H.	F	85	Three months	Botb bands, with pain, swelling and stiffness, and coldness and burning of hands and finger- tips	Local only One month	Definitely beneficial effect on contracture of fingers and bands
R M	F	34	Sprained back two weeks, fibrous indu- ration three months	Sprained back, also fibrous in- duration in right buttock fol- lowing deep muscular injec- tions	Local only Five weeks	Complete improvement of back, with softening of in- duration in gluteal muscle
D B	M	57	One year	Right ileogluteal nren	Local only Four weeks	Improvement (question as to whether prescription was used properly)
L B	$\mathbf{F}$	48	Four weeks	Right side of back and gall- bladder area	Local only Two weeks	Some improvement, with pain
P C	M	42	Six to seven months	Local induration involving pleura, nerves, and muscles following fracture of tenth and eleventh ribs		Slight improvement
D I	M	64	Four months	Deltoid nres of right shoulder, with marked tenderness and limitation of motion	Local only Two months	Some improvement (previous physiotherapy with external applications unsuccessful)
R M	F	33	Three 3 cars	Back and left chest, with severe	Local only Five months	Very little relief (back better than chest)
в Т	$\mathbf{F}$	41	Three weeks	Muscles of right forearm, with tenderness and swelling		Improvement
A S	$\mathbf{F}$	54	Three months	Left leg and hlp	Local only One month	Definite relief
A B	M	35	Five years	Right lower sacroiliac area	Local and oral Three weeks	Some improvement—teader ness and spasticity
вн	M	57	Two months	Severe torticollis, with tender- ness along nucbal area with fibrositic nodules along occi- pital ridge	Local and oral Two weeks	Definits local improvement
DK	F	51	Several years	Left arm, shoulder, and back with nodules in left deltoid muscle and several nodules in left side of the back	(with vita-	General improvement, with disappearance of nodules in back and elimination of tenderness in muscles
IR	М	04	Three weeks	Muscles and tendons of left leg and fibrotic sheath of sciationerve—with especially sovere pains in left knee	Local and oral Four weeks	Complete recovery (previous treatment of bakings and salves for two weeks had proved unsuccessful)
C M	$\mathbf{F}$	64	Two month	Atrophy and tenderness at alto of insulin injections	Local and oral Four weeks	Relief of pain in musclo areas
ΕZ	М	35	Few months	Left erector spinal and flank muscles—with severe back- ache on arising and bending	Local and oral	Marked relief, with only one spot of tenderness remaining
AS (MD)	M	66	Several months	Right knee and thigh, shoulders and hands, with considerable swelling, tenderness, and pain	high vitamın-	Marked improvement
P F	F	59	Several years	Back and inner muscles and insertions at knees, with tenderness, spasticity, and	Local with high vitamin-E	
A. S	M	28	Two months	acute pain  Small joints, especially latera  aspect of right foot—with  pain and swelling	l Local with high vitamin-E diet Three weeks	Improvement (though may have been due to other causes)
DС	M	67	Six months	Back, especially sacrolliac area chest, and lower abdomen		Good results
нF	M	19	Two months	Abdomen, especially over public area—with external pain and tenderness, and patient un	Local only Three weeks	Improvement
GН	M	31	Four weeks	able to stand erect or he prone Midlumbar muscles, with spas ticity and swelling	Lócal only Two weeks	Improvement
CK.	M	25	Four weeks	My ositis of left pectoral muscle and lumbosacral fibroeits	Local only Three weaks	Good
EL	M	62	One year	Tenderness and swelling of cal muscles with claudication	f Local and physiotherapy One month	Definite improvement
. P	M	42	Four months	Left lower anila, back, and both arms, with tenderness and pain	h Local with Ald pine exposure and injection of Na-Ca cody	<b>3</b> 1
A P	M	63	Two years	Several fibrotic nodules in sacro iliac area	late - Local only Four months	Marked Improvement
M V	M	55	Six months	Spasticity over left crecto muscles with tenderness m left sacrolliac area—patlen unable to bend or lace shoes	r Locai (with	Marked improvement—able to work after first week of treatment (previous physio- therapy bad been ineffective)
J L.	M	45	Four months	Pains in chest and both arm (condition proved to be o vascular cause)	r , rocul	No results
ıs	M	50	One 3 ear	Cramps in right calf muscles and numbness of toes of both fee (condition proved to be dia batto neuritis)	t Onsmonth	No results
				•		

(TABLE 1 -Centinued)

M A. (M.D.)	М	34	Four months	Left thigh with definite muscle space and swelling—confined to hed	Local with high vitamin-E diet Three weeks	Blow improvement (efter all conventional therapies had been unsuccessful)
A. V	M	42	Several months	Chest, back, right ascrolliac buttooks—conined to bed unable to move	Local oral and high vitamin- E diet Two weeks	Marked improvement—with patient shie to walk around residual pain over right superior secrollise and iliae notch (previous conventional treatments without evail)
M. K	M	50	Опе усаг	Peripheral vascular disease	Oral Two months	No results
G L	F	42	Two years	General muscle "ache through out body following fracture of tarsal bone with especially tender Achilles and popiliteal tendous	Oral and high vitamin E diet Three months	Clearance of all pains

germ oil\* is absorbed through the akin and has an affinity for fibrous connective tissue, acting as an "insulator" against hydremia, which manifests itself in edema and swelling. The phenomenon of water running off a duck'e back or keeping him afloat is an example, for when the oily exudate is removed, as by application of a wetting agent, water will penetrate his feathers and cause the animal to sink Similarly, the protective action of vitamin E against edema is probably due to its contact with connective substance. It would therefore appear that vitamin E is to fibrous connective tissue what vitamin A is to epithelial tissue.

Turning to the record, Steinberg's first reported on the use of vitamin E in the treatment of fibrositis. In 30 cases of primary fibrositis he achieved complete relief of all symptoms, through oral administration over a brief period In 41 cases of secondary fibrositis, 3 cases of sciatics, and 8 neurotic patients, no other favorable results were observed, except that in 8 cases of fibrositis secondary to atrophic arthritis a definite improvement of muscle soreness and stiffness was noted

Following Steinberg's first paper, <sup>12</sup> Inghami<sup>12</sup> reported on 12 patients with primary generalized fibrositis, all of whom were completely relieved of symptoms in three or four weeks following regular dally vitamin-E ingestion. In a following paper, Steinbergi<sup>14</sup> describes another series of 20 patients with primary fibrositis, all of whom were quickly and completely relieved of symptoms under oral vitamin-E therapy. In addition, there were 10 cases of secondary fibrositis, 2 cases of psychosomatic rheumatism and 6 miscellaneous cases, none of which responded Steinbergi<sup>13</sup> subsequently reported on a larger series of 60 patients with primary fibrositis, all but 5 of whom were completely relieved of their

symptoms, following a short regimen of therapy with tocopherols orally These 5 patients reported mitigation of their pain but not complete relief of generalized stiffness He also treated 36 patients intramuscularly with marked relief of the fibrositis symptoms Inunction therapy was tried in 4 patients, with negligible results. As a result of his studies to date, Steinberg believes that " the striking similarity between the pathological changes of primary fibrositis and nutritional muscular dystrophy (as described by Pappenheimer) is no mere accident This fact. plus the marked clinical improvement obtained in both conditions by giving the tocopherols, indicates that primary fibrositis is a metabolic disorder, concerned with the deprivation of vitamin Е"

#### Discussion of Cases

In our own study, 32 cases originally diagnosed as primary fibrositis were treated by the topical use of vitamin E in the form of an cintment Particular attention is called to the form in which the vitamin was used Belleving that the effects might be accelerated if vitamin E were in contact directly with the affected site, a special ointment\* was prepared which contained 30 per cent of solvent-extracted wheat-germ oil Results were very encouraging in several cases, so that we decided to continue to test such inunction therapy in a larger series, and we were rewarded with equally excellent results Of the 32 petients 31 were given vitamin E in the form of this ointment Of these 31 patients 19 received inunction therapy only In 6 the external application was supplemented by the oral administration of 3-mg capsules of mixed tocopherols daily In 4 the external application was supplemented by a diet high in vitamin E (green leafy vegetables, lettuce, and whole-wheat bread) Only I patient received all three measures, and of the remaining 2 cases 1 received oral therapy alone

<sup>\*</sup> The wheet-gorm oil employed is the solvent-extracted variety (not cold pressed) for it has been demonstrated that the process of solvent extraction size makes available other active substances, such as phospholipids, in addition to the vitamin E.

<sup>\*</sup> This cintment was made evallable through the courtesy of the Drug Products Co., Inc. New York.

and the other oral therapy with a high vitamin-E

These patients ranged in age from 28 to 66 years, 8 were women and 24 men. The history of the symptoms ran from a duration of three weeks to five years. In some cases the condition affected only a small area, such as both hands, and in others much greater areas, in one patient practically the whole body was involved in complaints of muscular tenderness.

Length of treatment ranged from two to sixteen weeks Improvement was marked and definite in 20 cases, fair in 9, and there was no improvement in 3 cases which proved to be of nonfibrositic cause. Of these 3, 1 was shown to be diabetic neuritis and the other 2 revealed vascular pathologies. Of the 17 cases of actual fibrositis receiving inunction therapy alone, 12, or 70 per cent, showed marked or complete improvement. In the remaining 5, or 30 per cent, the relief afforded was fair.

In the 13 other cases in which various combinations of therapy were administered approximately the same measure of relief (actually slightly less) was obtained, showing that oral or other therapy is not necessary to reinforce the efficacy of external application of vitamin E. The high vitamin-E diet alone was not suggested as a therapeutic measure, but was ancillary, and designed to prevent a recurrence, in maintaining vitamin-E metabolism. In the main, it was found that patients preferred the inunction form of medication, since it is convenient and simple enough to use, and appears to get more directly at the source of the local trouble.

The following case report illustrates in detail an important point in differential diagnosis, successfully treated with vitamin E

## Case Report

F H, a woman aged 35 years, married, was first seen in Beth-El clinic May 5, 1942 She complained of pain, swelling, stiffness, and numbness of both hands, sensation of coldness and burning, and formication of hands and fingertips in which a sensation like an electric shock is felt on touching objects. The patient further reported the hands and fingers to be discolored, brown and purple, with severe pain in them at night. Housework was impossible to do because of the pain and the inability to grasp and retain objects in the hands. A month before appearance at the hospital, the patient observed swelling of the ankles, but no pain or other associated discomfort.

History—In February, 1942 (three months before her appearance at the hospital) the patient experienced sudden pain, swelling, and redness of both hands which became worse upon doing housework or upon contact with cold water—There was some feeling of improvement upon application of

warmth Her past history was apparently negative, except for an operation for gallbladder disease in 1937, and menstrual irregularity with menses appearing every two to three months. The patient has two children and had normal deliveries

Physical Examination —She appeared well-nourished but overweight Her weight was 184 pounds. height, 621/4 inches and blood pressure, 150/80 Head, heart, and lung examinations were negative The patient was unable to make a fist, her hands appeared red and swollen, with brownish discoloration and cyanotic hue on the fingers, which were sensitive to touch. She had paraesthesias from wrists to fingertips, with the fingers taut, flexion and extension were limited and the hands remained cupped The interesser and thenareminences appeared atrophied The pulse was palpable at both wrists and oscillometric readings were 2.5 was no volar ischemia, but on contact with cold water the hands became purplish-brown pulse at the ankles was not palpable and there was Oscillometric reading was no plantar ischemia left ankle, 5, right ankle, 4 5

Diagnosis—The diagnosis made in the arthritic clinic was infectious arthritis, probably menopausal Stilbestrol was given—Examination at the gynecologic clinic revealed a normal pelvis and no treatment was advised—At the medical clinic, a diagnosis of Raymaud's disease and acute periarteritis was made—At the thyroid clinic, the patient was found, essentially, endocrinologically negative—She had a basal metabolic rate of plus 10, and normal vital capacity—The peripheral-vascular clinic concurred in the diagnosis of Raymaud's disease, with possible early scleroderma

Laboratory Data — The urine was negative, blood chemistry was as follows calcium, 11 74, phosphorus, 3 2, cholesterol, 298 4, uric acid, 5 92, and chlorides, 578 X-rays of the hands gave no evidence of osseous abnormality or calcification. The blood count was hemoglobin, 14 Gm, red blood count, 4,240,000, white blood count, 7,000 (Polymorphonuclears, 72 per cent, Lymphocytes, 22 per cent, and Monocytes, 6 per cent), sedimentation rate, 18 mm in 44 minutes (Wintrobe-Cutler)

Follow-up Report -On June 8, 1942, at the examination of the patient and in reviewing her history, the patient was perfectly well until the present episode, which occurred after several hours exposure to extreme cold Upon consideration of the previous history, the diagnosis was changed to frostbite, since it was deduced that fibrositis was created by vasospasm and interference with circulation, induced by cold. Metabolic treatment was instituted by a diet containing 125 carbohydrate, 75 protein, 80 fat, and a minimal intake of choles-Thyroid extract (0.03 Gm to 0.12 Gm three times a day) was prescribed, and exercises with soaking hands in warm solution was advised The hands became less painful at night under that treatment, and the patient lost 8 pounds and was able to sleep better The hands were still, however, cupped, and still powerless to grip and retain objects Wheat-germ oil was then prescribed, to be massaged into the hands A week later the hand musculature as well as color and temperature seemed improved, with greater mobility possible, but no nhatement of numbress. After two weeks, the patient was overjoyed at being able to hold a needle in the right hand, and reported disappearance of pain, lessening of the abnormal sensitiveness, and ability to eleep normally. The muscular atrophy in the interesseal space, as well as at the hypothemar and carpoulnar eminences, lessened. The patient was apparently well for a month, until she suffered an exacerbation of the numbress after eating scallious, radishes, and cherries.

Conclusion —A case of permic (frostbite) which does previously diagnosed as Raynaud e disease is reported Metabolle treatment improved the circulation and the subjective as well as objective symptoms Local application of vitamin E has a definitely beneficial offect on correcting the

contracture of fingers and hands.

Discussion of Gase at Beth-El Conference (By Dr Ant).—In the examination at a peripheral yascular clinic of a patient whose complaint is pain in the extremities, the examiner naturally is influenced in the direction of a diagnosis of thrombosingitis oblitarians arterioscierosis, or Raynaud's disease.

The facts connected with the case under observation would warrant ruling out thromboangutis obliterans, hecause of the acute onset, good oscillometric readings in all extremities, and the sex of the patient. Elimination of peripheral arteriosclerosis as a diagnosis was based upon the age of the patient (35 years) roentgenologically absent calcification of the vessels, and the acute onset. Raynaud e discase was left for consideration, and all departments examining this case apparently diagnosed it as Raynand's disease I felt that the diagnosis was faulty for the following reasons (1) this patient was ten to fifteen years older than the usual age at which Raynaud e disease appears, (2) the onset in Raynaud'e disease is insidious and may be precipitated hy dampness or cold, which aggravates them hut warmth improves them, whereas in this patient the onset although induced (?) by cold and sudden, did not necessarily improve in warmer weather, such as experienced in May, (8) pains and cramps associated with Raymoud a disease are present in all extremities whereas in this patient only the hands were involved, (4) the appearance of the skin in Raynaud's disease follows the pattern of (a) blanch ing, followed by cyanons (h) rubor (e) mottling and reappearance of the pattern through the progress of the disease, whereas the color pattern of this patient s hands did not even resemble that of Ray naude disease. The sequelae of Raynaude disease are ulceration and often gangrene which were not present in this case. Scieroderma was ruled out. for in that condition the principal diagnostic factors differing from this patient e condition, are thickening and tautness of the skin which may occur in any part of the body and particularly the face, the facies become masked and take on a sardonic appearance and later the skin takes on a glased appearance. None of these factors was present in the case prerented

This case has none of the signs of crythema pernio (chilbiains), which is the simplest form of peripheral vascular disease induced by cold. The gross and fine signs of this case, however, point to congelation (frestbite)

Frostbite occurs in three well-defined forms (Congelation crythematesa, C bullosa, and C escharotica), depending upon the length and severity of exposure. Through short exposure to cold or wind, the akin becomes mottled blanched, then dusky, and then purplish hrown discolorations appear. If mild, the condition improves in warm weather. In sovere cases of frostbite, there is a direct history of rather sudden onset from prolonged or extreme exposure to cold or wind. Any part of the body may be involved, and the lesion need not be symmetrical.

There is local freezing of the tissue, producing impairment of circulatory nutrition and even tissue death, such as gangrene In frosthite there is initial anesthesia, later there is a sensation of tingling or hurning, followed by pain, which may be excruciating particularly at night. Frostbite may affect a person of any age, and there is no predisposition. although we know that Infants are as a class less registant to it than adults as a class. There is no plantar or volar ischemia, and the skin over the affected part becomes swollen and shiny but not glazed. The oscillometric roadings are good, for the most part. In the case reported, the history and symptomatology as described fit in perfectly with a charmosis of moderately severe irostbite which has passed the stage of congelation erythematosa but

did not quite reach the bullous stage

Treatment -After treating the patient for Raynaud'a disease with the symptoms becoming progressively worse the treatment was changed to that for frostblte. The rationale employed was on a metabolic and nutritional basis, the object being to raise the supply of tocopherois and increase the body temperature, and consequently circulation, and to accelerate metabolism in the terminal parts involved. Fats were not unduly restricted, as they act as a tocopherol carrier, vitamin E being fat-soluble. Thyrold increases the basal metabolic rate, thus in creasing body temperature and accelerating circulation. A low-fat diet is apt to be low in tocopherols and, based upon our theory that tocopherol metabolism as well as low fat metabolism may cause subcutaneous edema, the diet was made proportionately high in tocopherois The pathology of this edema was described by investigators of this problem, and in interpretation, we assume that with swelling of the hands there is subcutaneous edema. and hy giving a normal fat diet with an increase of tocopherols we reverse this process. It has been demonstrated that akeletal muscles show hyaline degeneration and necrosis of the fibers with rupture and segmentation, pointing to the pathologic picture of a classic ischemic necrosis. In view of the fact that there is hemorrhage with hyaline thrombl in the small vessels, circulatory blockage occurs, which points to the cause of the lesion. The muscle becomes pale and "watery" and the fibers become fragmented and necrosed with Interstitial odema. Functionally there is a loss of muscle contractility A reaction sets in and is marked by the negrotic fibers becoming invaded by polymorphonnelear leukocytes and histiocytes These may fuse and form masses of cells, manifesting themselves as fibrotic nodules which harden and become tender to the touch.

If the condition progresses, calcification sets in or resolution takes place, repair consisting of gliosis and the formation of new fibrous connective It is interesting to note that the neurites and end plate are preserved in spite of this degenerative action in the fibrous and muscle tissue This leads us to postulate the nature of the pathology as a fibrous connective-tissue degeneration (myofibrotic rather than neural) andt hat tocopherols are necessary to maintain normal fibrous connectivetissue metabolism Alpha tocopherol is an antioxidant, and seems to be a dehydrating substance, and as such, would counteract the accumulation of fluids resulting from inflammatory or passive Tocopherols would appear to congestive causes prevent the solution of fibrous tissue and, as evident from the case discussed, the local application of tocopherols definitely acted in the regenerative process to cure this condition

## Summary

Of 29 cases of primary fibrositis treated by vitamin E (mainly in the form of an ointment). 20 cases showed marked improvement, and in 9 the relief of symptoms was fair Seventeen patients received inunction therapy only, and in this group improvement was marked or complete in 70 per cent, and fair in 30 per cent

In twelve patients receiving other forms of

vitamin-E therapy, approximately the same measure of relief (slightly less) was obtained—indicating that oral and other therapy is not the determining factor in re-enforcing the action of external application of vitamin E

It is, therefore, concluded that direct application of vitamin E to the affected site has a beneficial influence, apparently exerting a relaxant effect upon muscle fibers, relieving tenseness and tautness, the local application acting as a "lubricant" to prevent tissue injury through hydremia

Inunction therapy is favorably received by the patient

## OUR RESPONSIBILITIES

Times of crises, such as the present, are marked by two opposing results. The first of these is the elevation of many ordinary men to sublime heights of bravery, self-sacrifice, and almost unbelievable accomplishment.

The other is the exact antithesis of this—avarice. greed for power or glory—or in many instances such simple and all-too-prevalent vices as laziness and neglect-result in acts which in these times can only

be classed as treason or sabotage

The newspapers are full of reports of strikes, lockouts, and the lowering of standards in all walks of life. Unfortunately even in that often-called "high-est profession of all"—the healing art—similar weaknesses have shown themselves Individual cases are heard of all too frequently, but of special concern to us is the conduct of those in charge of our medical organizations

It is particularly imperative that the men who have left our midst for military service be assured that in their absence there will have been no lowering of the standards or standing of the hospitals colleges, and medical societies they left behind  $_{
m them}$ 

Those of us in control of such organizations have a very real responsibility to these men, especially—as well as the profession as a whole—not to permit any

such downward trends

Just as there has been much talk recently of war guilt, and we hear on every hand that those in authority will be held strictly accountable, not only for the crimes they have committed, but also for the ones they have permitted to take place simply through failure to exert their authority properlythere seems to us to be a day of reckoning in the near future when our returning physicians will demand and receive a strict accounting of our stewardship of their ethical standards, professional opportunities, and institutions!—Carl C Fischer, in Hahnemannian Monthly, May 1, 1945

#### HEMANGIOMA OF THE MEDIASTINUM CAUSING DEATH IN THE NEWBORN

VICTOR W BERGSTROM, M D, F A C P, Binghamton, New York

(From the Durston of Pathology Kilmer Memorial Laboratory, Binghamton City Hospital)

THE literature contains very few references to hemangiomatous tumors of the mediastinum in patients of any ago and seems to be almost barren of any reports of this condition in the newborn Before 1923 only 38 reports1 of mediastinal tumors in infants and children were made and none of them were of angiomas. In 1936 Bencinia mentioned a rare observation in the case of an 18-day-old infant who had no angroma of the percardium which ruptured into the percardial sac. Dodericin' in 1938 reported in the German literature n widespread hemangioma of the diaphragm, inner chest wall, and abdominal wall causing death in n 7-8 month premature infant who died soon after birth G J Houer in 1941, discussing the surgical treatment of tumors of the mediastinum, speaks of cystic lymphangiomas hut does not mention hemangiomas. Adams and Blocks in 1944 stated that they found one report in the literature of a malignant hemangloendothelioms in a man and they add the case of a man 34 years of age who had a hemangroma of the mediastinum. The tissue of origin of the tumor was not determined Geschickter and Keasbey<sup>4</sup> reviewed 570 cases of hemangroma at Johns Hopkins Hospital up to 1935 Sixteen were found in the heart valves. None were mentioned as arising in any other mediastinal etructure and the ages were not given.

The purpose of this paper is to present 2 cases of mediastical hemangioma causing death in the newborn (1) because to our knowledge these are the first to be reported in the United States, (2) because the condition is probably not as rare as the hierature leads us to believe (3) the symptoms in some cases should suggest in mediastical tumor, and (4) to encourage routine postmortem examinations.

#### Case Reports

Cass i—A girl baby (05831A), the firstborn of ormal parents with no familial history of vascular anomalies, was delivered normally, weighing 5 pounds, 10 ounces, on September 13, 1942. She appeared to be n perfectly healthy normal infant and was breast fed with supplementary feedings. On Aovember 24 weighing 5 pounds 7½ ounces, eleven days after hirth, the infant vomited, had a respiratory grunt and labored breathing refused to nurse and had in "greenist-blue color" The following day, November 25 there was considerable difficulty in passing a tubo to gavage the patient but it was accomplished. On November 26 the weight was 5 pounds, 10 ounces, nourishment was given by Brecht feeder, and cyanosis was increasing. The first note of coughing was on October 1, when there was considerable phlegm in the throat. On October 4 the child was very hlue, had spells of choking, and cred "as though in pain." The symptoms gradually became worse and death occurred on October 0 Complete x ray studies by Van Alstyne" showed a shadow in the anatomic position of the right middle lobe, right diaphragm, and cardiophenic angle.

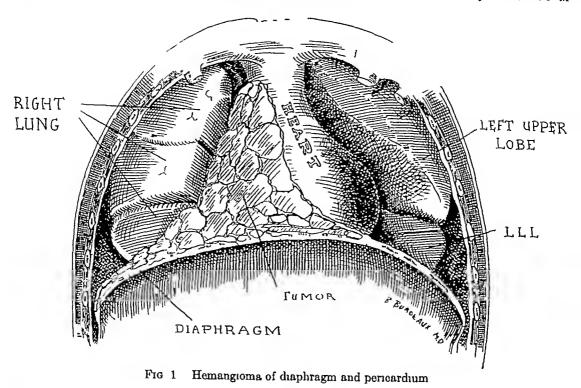

A postmortem examination one hour after death showed the sternium and anterior portion of the ribe to be unusually firmly attached, over a wide area, to the diaphragm. This measured up to 2 em in thickness from its anterior to the posterior origins and in two-thirds of the right portion. The thicken and control of the properties of the right portion around the great vessels (Fig. 1). About two thirds of the percardium up to its reflection around the great vessels (Fig. 1). About two thirds of the percardium was involved in the process. The thymus seemed to be involved grossly but the microscopic study later did not bear this out. The thickened tissues embarrassed the pleural and mediastinal spaces on the right side and partially obstructed the aorta, inferior vena cava, and esophangus by pressure and tortion produced by the tumor in the diaphragm. The symptoms can be explained easily from these findings. Thus, the cyanosa was due to anoxa brought about by the tumor in two ways (i) physical bulk and replacement of diaphragmatic muscle so that the diaphragm could not function, and (b) embarrassment of the heart action by the tumor in the pencardium and by the pleural fluid. The pressure and the esophagus in its passage through the diaphragm made it difficult to swallow and to pass the gavage tube Furthermore, there was considerable fluid in each pleural cavity and marked collapse of the lungs. The heart presented no gross pathology and the abdominal viceera were not remarkable.

Microscopic examination showed n very cellular hemangioma hypertrophicum composed for the moet part of small anastomosing capillaries, some without hlood (Fig 2A) In large areas the cellularity was so marked that there were no lumens and the compressed cells looked like fibrous tassue (Fig 2D) In other areas there were large cavernous spaces with very thin walls (Fig 2A) The lining of all the spaces was flattened endothellum and no evidence of malignant degeneration could be found.

ovidence of malignant degeneration could be found.
The tumor infiltrated and largely replaced the muscle of the diaphragm (Fig 2B), making it in-

capable of functioning

Another child born of these parents in 1944 is perfectly health; in every respect at the age of one year Cas 2 - A girl baby (1-6959), the firstborn of normal parents with no familial history of vascular anomalies, was delivered normally on August 30, 1944 weighing 5 pounds, 12 ounces. She was apparently normal in every respect and was hreast fed. On September 20 twenty-seven days after birth she had hlack and hlue areas on the hips and vomited blood-streaked material. She weighed 7 pounds, 8 ounces at that time. The same symptoms were resent on October 2 On October 4 the infant was admitted to the hospital, when various black and hlue areas were noted on the buttocks, back of the hand, and below the left hreast. The skin was dry and slightly icteric. Shortly after admission there was regurgitation of dark-brown mucus streaked with blood. This continued throughout the day. Death occurred on October 5 Autopsy performed eleven hours after death showed a poorly nourished body with a slightly icteric tinge in the conjunctives. Black and hiue areas were noted in the skin of the abdomen, back of the right hand, and were the vertebrae. These in no respect looked like

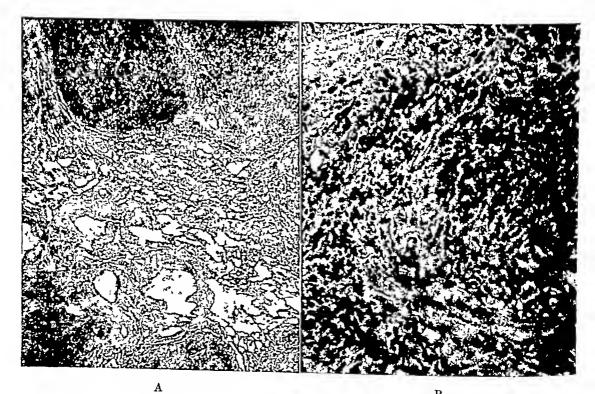

Fig. 2 A—Solid compact cellular portion and looser more cavernous portion, B—Higher power of more cellular area infiltrating muscle of diaphragm

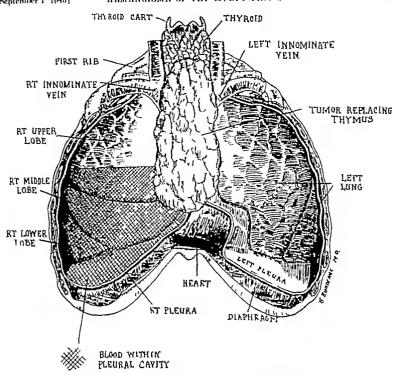

Fig. 3 Hemangioma of thymus ruptured into right pleural cavity

telangicetasias When the thorax was opened the right pleural cavity was found to contain a large quantity of blood. The thymus was replaced by a dark, purphah-red tumor which measured 8 cm. in length by 5 cm. in diameter (Fig. 3) It had ruptured through the capsule, permitting the escape of blood into the right pleural cavity. The tumor was firmly adherent to the pericardium from which it could not be dissected. When the pericardium was opened the smooth inner lining was found to be hemorrhagic and the pericardial fluid, not increased in amount, was bloody. On section the tumor was found to be made up of large vascular spaces like a sponge filled with blood. A small amount of thymus could be identified at the lower pole of the tumor. No telangicetasias of the gastrointeetinal tract nor other gross pathology of note was observed.

Microscopic examination showed the thymus to be surrounded and divided by a cavernous hemangiomatous mass of tissue which involved the capsule and intrabbular connective tissue (Fig. 4B) and did not actually invade the thymic pulp except in an occasional area. The pulp was, however, heavily infiltrated with hlood, by which many lohules were replaced or destroyed. The angioma seemed to arise by vascular proliferation of fine capillaries both inwardly toward the substance of the gland and outwardly away from the capsulo. The capillaries gradually increased in caliber until they became dilated spaces with walls one or two cells thick, filled with blood (Fig. 4A). In some areas the walls were incomplete so that large communicating spaces like srectile tissue were formed. It is interesting to note that the hillus of one lung also contained many large, thin-walled veins looking very much like cavernous homonglomatous tissue. The structure of this angioma differed from that in Case in that the vascular spaces were large and had thin walls like a cavernosum, whereas the tumor in Case I was made up of small spaces with thick walls.

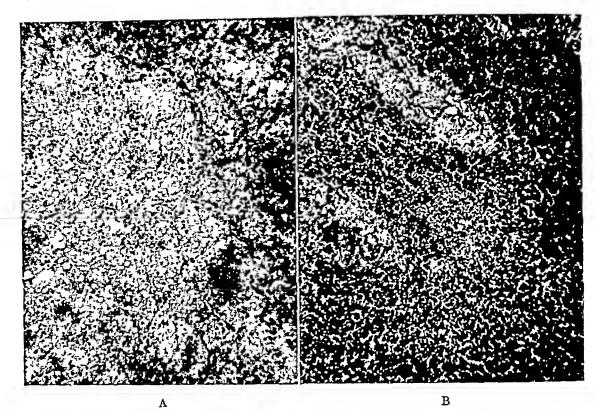

Fig 4. A—Dilated spaces filled with blood, B—Thymus with angiomatous septa.

Speculation as to the origin or cause of these tumors is probably fruitless, but a study of the histogenesis of blood vessels makes these defects more understandable They are probably congenital anomalies arising on the basis of a vascular developmental defect Ewing felt that the congenital origin of the great majority of angiomas "speaks strongly in favor of a tissue predisposition" He distinguished between true angiomas "in which a neoplastic process affects the walls of vessels and usually also the supporting connective tissue" and those in which there is excessive development of more or less normal vessels The two cases presented here fall into the latter group Shaws felt that angiomas come from angioblastic cells in the vascular layer of the embryo which remain disjointed when other similar cell groups link up to form the normal blood vascular system These cell masses proliferate, giving the appearance of stunted blind capillaries which contain no blood, or a more cellular growth produces the compact angioma, and finally, if the capillaries become connected with the general circulation the cavernous angioma results Geschickter and Keasbeys and MacCallum quote Ribbert's theory that these tumors grow from their own rudimentary embryonic vascular substance and not through the widening and assimilation of adjacent blood vessels Geschickters states that arterial cavernous angiomas consist of thin-walled endothelial spaces filled with red blood cells associated with areas of hemorrhage and zones of angiomatous tissue of capillary type The rapidity with which the disease becomes manifest after birth and the severity of the symptoms are dependent on the size, number, and directness of the arteriovenous According to Arey,10 capillary communications plexuses are shown to precede the formation of defi-"Only by the nite arterial and venous trunks selection, enlargement, and differentiation of appropriate paths do the definitive vessels arise, whereas those capillaries from which the flow has been directed atrophy" From this it is not difficult to picture the development of an angioma

## Summary

Two cases of hemangioma of the mediastinum causing death in the newborn are presented with autopsy findings

1 A healthy appearing newborn infant gradually developed symptoms of respiratory difficulty as evidenced by a respiratory grunt, coughing, choking, and cyanosis The symptoms rapidly became worse and death ensued twenty-six days after birth and fifteen days after the onset An autopsy revealed a hemangioma of the diaphragm and pericardium, adequately accounting for the symptoms

The onset, development and character of the symptoms are pathognomonic of a progressive mediastinal

tumor

2 A healthy newborn infant developed its first symptoms of black-and-blue areas in the skin and vomited blood-streaked material twenty-seven days after hirth The symptoms rapidly became more severe, with the addition of a slight ictoric tinge to the skin and death followed nine days after the onset and thirty-six days after birth. No pressure symptoms were observed, prohably due to the location of the angioma in the thymus in the unper part of the mediastinum, where there was more room for expansion. An autopsy revealed the cause of death to be hemorrhage due to runture of the hemangioms into the right pleural cavity

These are the only 2 cases of this kind found in approximately I 200 autopues in this hospital. Honever it is folt that if autopsies were performed in all cases of death and especially so in infants presenting the symptoms mentioned in Case 1, more tumnrs of this kind would be found

## TRAUMATIC BILIARY CYST OF LESSER SAC (OMENTAL BURSA)—OPERATION. RECOVERY

GRISWOLD D NAMMACK, MD, FACS, FERDINAND H HERRMAN, MD, and SIDNEY HIRSCH AB, MD, MICS, Far Rockawas, New York

(From the Surgical Service, St. Joseph's Hospital)

THE comparative infrequency with which the surgeon encounters injury to the abdominal viscera without penetration of the abdominal wall or chest and the frequent difficulty in making a correct diagnosis of a grave internal lesion because of the apparently unimportant external trauma warrant the report of this case Nonpenetrating trauma of the abdomen or chest may cause rupture of Intraabdominal structures without evidence of external injury or with signs of only a simple contusion of the abdominal wall The bigh mortality associated with this type of injury because of the pltfalls in diagnosis and therapy urges the need far earlier recognition and earlier operative interference when Indicated.

Numerous references in the literature relate to

biliary pentonitis resulting from a ruptured liver or hile duct, but meager mention is made of localization of biliary peritonitis to the lesser sac (omental This case exhibits such an injury that gradually led to the formation of a large bluary cyst of the lesser sac with gradual deterioration of the

Fra 2 Path of rubber tube through gastrocolic ligament for drainage of lesser sac.

Fig 3 Site of entry of drainage tube

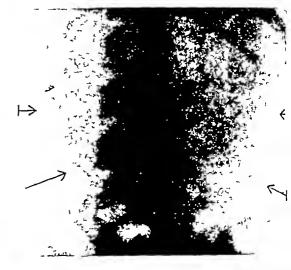

Fig 4 X-ray plate of abdomen showing collection of fluid in lesser sac

patient in spite of supportive treatment, until operative intervention with drainage of the cyst immediately set the stage for the patient's complete and uneventful recovery

## Case Report

N P (76878), age 9, was admitted to St Joseph's Hospital on January 9, 1945, in severe shock He had just crashed into the rear of a rapidly moving truck while sleigh-riding Examination showed him to be cold and clammy with boardlike rigidity over the entire abdomen and Moynihan right lower quadrant tenderness and liver tenderness. There quadrant tenderness and hver tenderness was also an elevated area over the right pectoral region, suggesting a tear of the pectoral muscles His pulse was rapid and thready On supportive therapy the patient gradually recovered from his shock. Because of ecchymosis over the left elbow and the right hip and the presence of red cells in the urine, the possibilities of a fractured left elbon and right hip and of a ruptured bladder were investigated but not confirmed. His condition improved, as manifested, by stationary blood pressure, slowing of his pulse, and rising hematocrit, hemoglobin, and red-cell count His abdomen softened On the third day after admission he moderately became distended and began to vomit bile-stained contents (ileus) The vomiting and distention continued intermittently thereafter, in spite of the passage of a Levine tube (decompression) and supportive parenteral (plasma) therapy Or seventh hospital day his skin became icteric On the dominal x-rays showed moderate amounts of gas in the colon and in several coils of the small intestine No fluid levels or free air were disclosed, but there was a diffuse clouding suggestive of free fluid in the abdomen, together with another area suggestive of an encapsulated collection in the epigastrium and left hypochondrial region

By the eighteenth day after the injury the vomiting and distention persisted, but there was some re-

covery from the ileus, as manifested by fair bowel movements. The child lay with his left thigh abducted, externally rotated, and flexed (retropertoneal syndrome). He complained of pains in both shoulders. He had a positive Weiss sign (retraction of testicles on abdominal pressure). There was tenderness in the left upper quadrant and a suspicion of shifting dullness in the abdomen. Abdominal aspiration yielded a few drops of dark blood.

After additional parenteral therapy, exploratory laparotomy was performed on the thirtieth day after the accident. A long left-rectus-muscle-splitting incision with a transverse extension was made. There was very little free bile-stained fluid in the peritoneal cavity, together with a greenish tint of the contents. The lesser sac was found to be greatly distended, pushing forward the hepatogastric ligament and the gastrocolic ligament Evacuation of the omental bursa through the gastrocolic ligament yielded about 8 quarts of dark bile. Drainage was secured by the insertion of a large rubber tube into the omental bursa. The gallbladder, which at first was considerably distended, emptied after evacuation of the lesser sac. A dense mass of adhesions covering the inferior surface of the liver in the region of the right and left hepatic ducts was not disturbed so that no evidence of a rupture of the liver or of a bile duct was actually demonstrated.

The child made a complete and uneventful recovery and was discharged on the twenty-fifth postoperative day

## Summary

A case is presented of an aseptic general biletinged peritonitis and a lesser-sac-loculated collection of 8 quarts of bile, produced by an apparently nonpenetrating wound of the abdominal wall. The consequences became more grave, until operative interference evacuated the large cystic collection of bile. The eventual prognosis depends on possible formation of a stricture or complete healing of a probably torn bile duct.

## OBLITERATIVE ARTERITIS IN THE FINGERS DUE TO OCCUPATIONAL TRAUMA

JOHN VAN DUYN, 2nd, M.D., Syracuse, New York

JA June, 1944 Barker and Hines' reported eleven cases collected over a period of seven years of "arterial occlusion in the hands and fingers associated with repeated occupational trauma." There was no evidence of arterial disease in any but the affected hand in any patient. Scalenus anticus syndrome Raymoud's disease and arteriosclerosis obliterans were eliminated as causes disease was considered unlikely although it could not be excluded entirely because no pathologie examination was made of the vessels in the involved area.

Recently I followed a case in which arterial occlusion in one finger was similarly associated with repeated occupational trauma and in which amputation was eventually necessary, permitting pathologic examination of the involved vessels

#### Case Report

On August 25, 1042 E. R., a previously healthy man, aged 44 years, was referred to me by Dr Robert C Robb complaining of swelling reduces, throbbing pain, and extreme tenderness in the distal phalanx of the right index finger of three days' duration, steadily getting worse,

Five days before on August 20, 1942 while the patient was taking a drill from a box the right index-finger tip was pleaced by a metal splinter from the shaft of the tool.

A diagnosis of felon was made and, on August 25 1942, under general anesthesin, the finger was opened widely on the medial side of the distal phalanx, the Incision penetrating well into the anterior enclosed space. No gross pus was seen. A rubber tissuo drain was inserted and the patient was allowed

to go bome.

In spite of an apparently adequate inculon, hower, the finger did not improve. The throbbing In spite of an apparently account increases, abover, the finger did not improve. The throbbing pain continued with little lotup and bealing did not progress. September 19 1942 the patient was admitted to the University Hospital of the Good Shepherd with a diagnosis of probable osteonyeluts of the distal phalax. Examination of the right incex finger showed a widely open incuron on the medial aspect of the tip discharging a small amount of thin pus. There was little inflammatory reaction evident, the fingertip baving a somewhat cadaverous appearance.
Roentgen-ray examination on this date (August

19, 1942) revealed "definite decalcification of the dutal phalanx of the right index finger, indicating an infectious process." On September 22, 1942 after a futile trial of conservativo measures, the diaphysis of the distal phalanx was removed under general anesthesia. The bone was found to be friable, al though apparently not grossly infected. A culture of the wound at this time yielded Staphylococcus aureus and Bacillus coli communior On September 26 1942 the patient was discharged as still unimproved.

On October 10 1912, fifty-one days after the miury, the patient was readmitted to the hospital

Barker N W., and Hines, E. A. Jr 1 Proc. Staff Meet., Mayo Clin, 191 345 (June 28) 1944.

with practically no reliof and the operative site continued to show no tendency to heal. Amputation was performed on the day of admission (October 10 1042) through the proximal portion of the middle phalanx The stump was closed without drainage and healed rapidly and cleanly It was noted at the operation that no bleeding at all took place from the slump no vessels requiring ligation or clamping Following this observation an investigation was made into the occupational history in hope that it might explain the unexpectedly poor healing of the infection Occupational History -For the past twenty-seven

for amputation of the finger. Since he had been discharged two weeks before be had continued to

suffer persistent severe pain in the affected finger

years except for an intermission of five years, the patient had worked as a toolmaker in the special job of drill twisting This work consisted in turning and guiding forward the shaft of a drill as it was being grooved in n lathe the tool being held in the index finger and thumh of the right hand.

The patient bad been conscous of numbress and coldness in all the fingers of this right hand, especially in the index and middle fingers for the past three years. He also noticed that after midding a fist the pads of the fingers on the right band stayed pale longer than those on the left. During part of this time he was under treatment by a physician without benefit.

Result of Pathologic Examination.—The pathologic report is as follows "There is considerable chromo inflammation in both the subepithelial and deeper ussues. One large artery (the only one included in the section) shows almost complete obliteration of the lumen due to intimal thickening The other vessels are not unusual "

This picture in no way suggests that seen in rembeaugutis obliterans. Similar obliterative thrombonsgiitis obliterans. changes are to be found in the arteries of the uterus and ovaries in scrility and in the stomach wall near an ulcer (Dr George II Resfonstein) (See Fig. 1)

#### Comment

Thus the pathologic report in this case rules out thrombosis, arteriosclerosis thrombosngiltis obliterans and pure vascepasm, and explains the occlusion on the basis of intimal thickening. It still cannot be shown on purely pathologic grounds, however, whether the intimal thickening in the digital arteries preceded the accident or was a result of the subsequent infection

There are three good reasons for believing that occlusion was present before the accident. are as follows (1) Numbness, coldness and other evidence of impaired arterial circulation in the involved finger were definitely present for at least three years before the injury (2) In Barker and Hines' 11 cases, in which arterial occlusion was similarly present and occupational trauma was similarly severe and confined to the affected areas infection was not a factor (3) The felon did not respond satisfactorily from the very beginning to what appeared to be adequate surgical treatment.

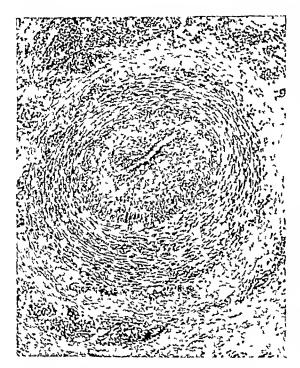

Fig 1 Photomicrograph of digital artery in amputated finger, low power, showing almost complete obliteration of the lumen due to intimal thickening

## Follow-Up Study

The patient was last seen on December 28, 1944, a little over two years after the amputation. At this time the stump of the right index finger was entirely satisfactory to the patient except that it still pained if accidentally struck on the end and

still felt cold The patient had returned to his former work as a toolmaker for one year after discharge from the hospital but then took up farming He stated that his hand bothered him very little on the whole, but that he still noticed numbness in the right hand at times and had to rest it every little while when milking or pitching hay

Examination showed the stump to be well healed, of fairly good color, with good motion in the joints and not particularly tender. It did, however, feel definitely colder throughout than any finger of either hand. Allen's test<sup>1</sup> was negative, indicating no obstruction to blood flow in either radial or ulner arteries.

In a final report from the patient on May 30, 1945, he stated that his right hand and even right arm still bother him considerably because of numbness, so much so that at times he is almost unable to use them. Whether this means that the process is still progressing cannot be told as yet.

## Conclusions

1 Certain occupations, such as toolmaking, which involve repeated trauma to the fingers or hands over long periods of time, appear to be capable of bringing about a marked impairment of circulation in that part

2 The circulatory impairment in the index finger in the reported case was due to occlusion of the lumen of the digital arteries by a thickening of the intimal coat, and not to vasospasm, thrombosis, arteriosclerosis, or thrombosinguitis obliterans

3 This condition is important medicolegally because it may not only seriously reduce the efficiency of the involved fingers or hands but may render them dangerously susceptible to accidental infection.

4. It may be that the disease progresses even after, the occupation that originally brought it about is discontinued

713 East Genesee Street, Syracuse 2, New York

## BACTERIOPHAGE NOW VISIBLE

Bacteriophage, formerly invisible foe of diseaso germs, has now been seen through an ordinary light microscope, Dr Alvin W Hofer, of the New York State Agricultural Experiment Station, and Dr Oscar W Richards, of the Spencer Lens Company, Buffalo, report (Science, May 4)

When the electron microscope made it possible to see bacteriophage particles, scientists found that they were larger than the flagella of bacteria. Since the flagella, tiny whip-like affairs extending from bacteria, can be stained and seen under ordinary light microscopes, it seemed reasonable to suppose bactoriophage particles could too.

bactoriophage particles could, too
This has now been done
Trist the bacteriophage
was treated with auramin, a dye, and radiated with
ultraviolet rays
The bacteriophage particles then

appeared through the microscope as bright-yellow pinpoints of light in an otherwise dark field With further study, Dr Hofer and Dr Richards developed two more methods for making bacteriophage visible

These involved the use of stains or dyes, one a modification of the acid-fast stain, and ordinary

ugu

With these methods and use of the new phase-difference microscope, the scientists were able to work out the order of events in bacteriophage destruction of bacteria. The sequence agrees with that seen in a darkfield motion picture, made by Dr. A. J. Pijper, of Pretoria, South Africa, showing bacteriophage action on a strain of typhoid-fever organisms—Science News Letter, May 12, 1945

## CONFERENCES ON THERAPY

DEPARTMENT OF PHARMACOLOGY AND MEDICINE, CORNELL UNIVERSITY MEDI-CAL COLLIGE AND THE NEW YORK HOSPITAL, NOVEMBER 30, 1944

THESE are stenographic reports, slightly edited of conferences by the members of the Departments of Pharmacology and of Medicine of Cornell Univorsity Medical College and the New York Hospital with collaboration of other departments and in stitutions. The questions and discussions involve participation by members of the staff of the college and hospital students and visitors. The next report will appear in the October 1 baue and will concern "The Management of Pain due to Muscle Sparm

#### Penicillin

Dn McKeen Cattell Penicillin, the subject of the conference today, is one of special interest to us all Dr McDermott, who has done a good deal of work on the subject and is associated with the National Research Council committees concerned with the problem, will discuss the therapeutic application of penicillin, but first I might say a few words on the nature of the preparations employed

As you all know, pencillin is the bacterial substance formed by certain strains of the common green mold, Pencillium notatum. The material accumulates in the culture medium, from which

it is extracted for clinical use

The yield is extremely variable and is affected by a number of factors. In the first place, different strains vary enormously. The product is unstable in an acid medium, and since cultures tend to become more acid with time, the yield may be increased by buffering at a pH around 6. It has been shown that contamination with a number of grum-negative bacteria which are not affected by penicillin greatly reduces the yield. A substance has been extracted from such bacteria which inhibits the action of penicillin and has been named penicillinase.

A modified Czapek-dox medium is usually omployed. This is a synthetic medium buffered with disodium phosphate to get a pH of about 6. The yield may be improved by inoculation with used culture medium.

The materials used clinically vary greatly in their potency, but in general they have about

half of the activity of pure penicillin.

For this reason, in order that doses of known potency may be administered, each batch of penicillin is standardized and each ampule is labeled for its content of activity in terms of the Florey or Oxford unit. These two terms are synonymous. The Oxford unit is a purely arbitrary designation and represents the potency of a batch of material which Florey prepared. Recently at a conference held in London an international standard of potency was adopted

Eight Gm of a pure sodium sait of penicillin having a potency of 1,650 Oxford units per mg has been set aside for use as the reference standard. The conference recommended that the international unit be defined as the specific penicillin activity contained in 0.6 mg of the standard. The new unit which will presumably be adopted by this and other countries as the official designation of potency is approximately equivalent to

that of the Florey or Oxford unit

Two methods for the assay of penicillin sointions are in general use. One is the serial dilution method, which represents an activity which just prevents growth in 50 cc of a meat-broth culture of a standard strain of Staphylococcus aureus The method used and recommended by Florey is that of the extent of inhibition of the growth of staphylococcus on sealed agar plates The solution of penicillin is placed in a cylinder resting on the surface of the agar The diameter of the inhibited area is proportional to the concentration of the penimilla solution in the cylinder Desageresponse enryes are obtained for the standard and the diameter of inhibition produced by the unknown material is then expressed in terms of the activity of the standard

We have no method of estimating the concentration of penicillin in the body fluids by chemical means. However, approximate estimates can be made by utilizing the assay methods which I

have just described

By the addition of penicillin to blood it has been established that the degree of antibacterial action is within limits directly related to its concentration in the serum. Maximum bactericidal effects against the bemolytic streptococcus were produced by concentrations of 0.02 to 0.16 Oxford units per ce. Concentrations of at least 0.16 units are required for maximum bactoricidal action against staphylococcus aureus.

Penicillin differs from the sulfonamides in that it is not uniformly distributed throughout the body water Under ordinary circumstances very little can be demonstrated in the spinal fluid, the saliva, or tears following intravenous injection

Furthermore, it apparently does not penetrate the cells to any extent Determinations by Keefer's group show that the red blood cells contain less than 10 per cent of that in the plasma

Following intravenous injection penicilin disappears from the blood stream very rapidly Following the administration of a small dose (5,000 units) none can be demonstrated after about forty minutes. Larger doses persist for not more than two or three hours. Nearly all the injected material can be recovered in the urine, that is, about 70 to 80 pci cent of the amount given. There is evidence that a small amount is excreted in the bile, and some may be destroyed by the tissues.

Dr McDermott, will you continue the discussion?

DR WALSH McDermott Our discussion will be based on the experience of the two-year period in which approximately 18,000 civilian patients were treated with penicillin in this country as part of the investigative program, and almost as many were treated with penicillin obtained from commercial sources. We are in the position today where we can talk fairly definitely on the immediate results from the administration of penicillin in the treatment of the acute and subacute infections. We are no longer in the period of day-to-day trial and error in this field. The problems to be settled in the immediate future have now become fairly obvious

One only recently debated problem has been very definitely settled, and that is, that in general the preferred method for the administration of pencillin systemically is by the intramuscular route. The question of the use of pencillin locally will be discussed later.

First, I would like to mention briefly the results which have been attained in the acute infections. The figures which I quote are those reported by Dr. Keefer as chairman of the Chemotherapy Committee of the National Research Council.

In the staphylococcic infections with bacteremia, the mortality rate has been cut from 85 per cent to about 15 per cent. Cavernous sinus thrombosis now has a mortality of only approximately 25 per cent. With acute osteomyelitis the mortality figure is cut down to 10 per cent or lower, but with staphylococcic endocarditis only about 25 to 35 per cent of the patients go into a remission. Pneumococcal pneumonia is quite easily handled with relatively small amounts of penicillin and the mortality figure on an unselected series runs around 6 per cent. It is probable that that mortality rate will never be re-

duced much below 4 per cent because of the many other factors, besides the factor of infection, which play a part in the mortality of this disease As far as pneumococcic empyema is concerned there is still considerable debate about the method, not debate about the results Everyone agrees that a great deal of the malignancy of the disease has been removed and that we are saving patients with pneumococcal empyema who would have died prior to the use of penicillin The debate is just how many patients will require draining Dr William S Tillett, at New York University, has had the most extensive experience and believes that very few patients require surgical dramage other than aspiration Our much more limited experience has not been quite as happy as that, and I believe that a significant percentage of patients will require some form of surgical drainage other than aspiration. In any event we now use only aspiration in a much higher proportion than was formerly the case

Pneumococcal endocarditis has about the same mortality rate as staphylococcal endocarditis following penicillin therapy, 1 e, about 25 to 35 per cent immediate survival or "remission"

Pneumococcal meningitis is still a problem The survival rate ranges around 65 to 75 per cent However, there is a factor which must be considered In a few instances, surviving patients have been left with considerable brain damage due to the prolonged infection, and the chemotherapeutic agent has caused the survival of a hopelessly crippled member of society Another problem in the therapy of pneumococcal meningitis is whether the combination of sulfadiazine and penicillin is more effective here than penicillin alone It is my belief that the combined therapy is necessary because of the greater diffusibility of the sulfonamide Most of the patients with this condition whom we have treated have received both agents The best opinion at the moment is that this is an unsolved problem and will have to be investigated further

As far as Group A streptococcic infections are concerned, the meningitis, endocarditis, and empyema are about the same as the pneumococcic infections in regard to response to penicilin therapy

Pharyngitis and tonsillitis can be very satisfactorily treated with penicillin, but it requires at least five to seven days of therapy with penicillin before one can prevent relapse in an ordinary streptococcic sore throat, and it requires the daily administration of approximately 100,000 to 200,000 units

In uncomplicated gonorrheal ureteritis in the male, there have been no instances of cases which were refractory to treatment by penicilin

The same is true with regard to female generrhen. Here one of the problems is that frequently sufficient bactonologic proof is lacking of nileged resistance.

The patient still continues to have vaginal discharge, possibly due to some gram negative diplococci. Since cultures are not run through the sugars, the precise organism is not identified.

Dr Donald Anderson tells us that 5 patients with gonococcal endocarditis have been treated, of whom 2 have recovered

Treatment of gonococcal arthritis is quite satisfactory, but, as in the other forms of penicilin therapy, it requires fairly prolonged treatment A short period of two or three days may be followed by a relaise

Some of the muscellaneous infections in which penicillin has proved of use are the fusopirochetai infections arising around the gums and teeth with involvement of the structures of the neck and certain anaerobic infections which were previously resistant to treatment. Certain strains of constructions considered the penicillin. Dr. Anderson reports that 26 such patients have been treated and 19 have been recorded as improved. However, such a chronic infection will require quite n long period for evaluation of the results.

Penicillin is quite effective in meningococcic infections, but in the research program not n great number of patients have been treated. This is because of the fact that sulfadiarine is so effective that only recently have many civilian patients been treated with penicillin. If penicillin is to be used, it should be administered intrathecally as well as systemically

In hrief, a number of potentially serious acuta infections, many of which wore quite satisfactorily treated with sulfonamides, are being even more satisfactorily treated with pencillin, and at conaderably less risk to the patient

There is an important phenomenon which occurs with the use of penicillin in the treatment of acute infections which has a bearing on the treatment of subacute infections. If a patient with an uncomplicated pneumococcal pneumonu. or a Group-A streptococcus sore throat receives a small or a large dose of penicililu ranging in size from 10,000 to 300,000 or 400,000 units over a fairly short period of time, all the signs of infection may disappear, but the immediate and complete remission will last only for from one to two or three days and is then followed by a rolapse As this period of latency before relapse in acute infections is hrief, it has been relatively easy to try out a number of different regimens of penicillin therapy to establish which ones are superior. In the less acute infections, such as

staphylococcic bacteremias, bacterial endocarditis, infectious syphilis, and neurosyphilis, the same phenomenon holds, that is, a relatively small amount of penicillin given over a relatively short period of time results in disappearance of all the symptoms and signs of infection, but in n fairly high percentage of patients relapse occurs The difference between the acute and subacute infections lies in the fact that the period before relanse in the subscute infections may be a matter of many months. If it takes six months, it is quite obvious that may changes made in a given regimen may not be appreciated for at least six mantles later and, therefore, it is difficult to compare regimens of treatment of staphylococcic bacteremas, etroptococcal endocarditis, and syphilis The establishment of the proper timedose relationships for these infections is one of the pressing problems at present.

Anothor important problem, and one of the vexations of therapy, is the question of the relative efficacy of repeated intramuscular and of continuous intravenous injections. Efforts are being made to prelong penicillin action with a minimum number of injections. The first neproach is obviously to give a large amount of aqueous penicillin, as the toruc ceiling of penicillin.

has not as yet been determined The 0 078 unit per co concentration of penicillin in the serum is the one which, in vitro, is more than enough to inhibit completely most of the organisms susceptible to penicillin It may not be sufficiently high to inhibit completely staphylococci or nonhemolytic streptococci present in bacterial endocarditis A few examples will illustrate the blood levels attained and the duration of an effective concentration of penicillin given by intramuscular injection doses of penicillin, 300,000 to 800,000 units, given in a single intramuscular injection, tho 0 078 unit per cc level may be attained for periods ranging between four and six hours Capt Romansky, working at Walter Reed Hospital, incorporated penicillin in peanut oil and beeswax and gave it intramuscularly He reported the 0 078 nmt per ec concentration or higher was attained and maintained for ten to twolve hours after a single mjection of 300,000 units of this preparation

We have been using penicilin in 5 per cent beeswax and have obtained high levels for twelve hours, concentrations which were significantly higher than 0 078 unit per ce. However, after one lajection of 150,000 units the lovel foll below the critical point in the second hour, which indicates that the absorption of the material is somewhat irregular. With both aqueous and beeswax vehicles, the concentration of penicilin in the scrum lasts for appreciable

periods of time, five to twelve hours. The difference between the two is that with the aqueous penicilin the initial concentration is much greater, up in the neighborhood of 10 or 20 units per cc, if enough is given, whereas, with beeswax, absorption is inhibited and the maximum concentration is much lower. In both, the duration of the level is of the same order. There is then the question whether these very high peaks are of any therapeutic importance of whether it is merely the prolongation at a certain relatively low level that gives the best therapeutic results.

The solution of this problem is important. We have been working on it and our preliminary studies indicate that once a certain relatively low concentration is obtained, the important matter is to prolong that concentration over many days, or in certain infections many weeks, rather than to provide multiple peaks of high concentration

If that is true, and I think it probably will be proved to be true, it makes a great deal of difference in the treatment of subacute infections, because we will have to think here in terms of from four to twelve and even more weeks of therapy

At the present time the intramuscular method is the best one. Technically, the maximum limit of therapy by this route would be about four weeks. Obviously, we will have to find some other method of administering the material if the treatment of the serious subacute infections is going to require such prolonged therapy.

The three main problems before us for the next year are one, the chinical problem of pneumococcic meningitis, and whether or not sulfadiazine should be added to the treatment, two, the problem of the time-dose relationship of penicillin therapy, and three, a subdivision of the second, better methods of administration, for our present methods will not do if prolonged therapy is required

The one-week regimen for the treatment of infectious syphilis is about as good as anything used previously in the treatment of this disease, but is still not ideal in terms of relapse rate In bacterial endocarditis more than half of the patients will go into a remission How many of those will sustain that remission for periods as long as several years we don't know In neurosyphilis we can produce an effect, which probably does not last long enough with our present methods of administration I think we have every reason to believe, however, that with better methods of administration and better knowledge of the time-dose relationship, we can achieve very satisfactory results in these less acute and chronic infections

DR CATTELL You now have the opportunity to put questions to Dr McDermott I am sure

that there are many problems which you would like to put before him

DR HARRY GOLD Outside of the case of pneumococcus meningitis are there any conditions for which you would now recommend the sulfonamides instead of penicillin?

DR McDermott Yes Urmary tract infections due to B coli, which can be a very serious thing in pregnant women and others, are treated with the sulfonamides only Certain of the bacillary dysenteries are best treated with sulfadiazinc The immediate future of the sulfonamides probably lies with these infections and in the field of mass chemoprophylaxis, such as in the inheumatic-fever study of the Army and Navy

DR MARION B SULZBERGER What are the prospects of developing a satisfactory oral penicillin?

DR McDermott The prospects are good Dr Wheeler Has that not been done already?

DR CATTELL Yes, there are reports of patients in whom adequate blood levels were maintained when penicillin was administered by mouth. It is apparently a matter of the amount of material one is willing to use

DR WHEELER What is the present status of the method for maintaining the blood level by blocking the renal excretion with diodrast or some other substance?

DR McDermott We have had no experience with that All I know are the reports published in the literature, and I believe it works as stated in the reports. Our own feeling is that it is not worth while to spend valuable time and the time of laboratory personnel in methods for saving penicillin because the problem of saving penicillin will not be with us very long

DR CATTELL But that will also decrease the number of injections

DR McDermott That is the thing we are after I think decreasing the number of injections by adding such an unphysiologic process as blocking tubular reabsorption is unsound I don't like it

DR GOLD Is that really an injury of the tubules or merely a competition? It is not unphysiologic as far as I can see

DR McDermott It is adding another drug, and if you add one more drug you add all the potential troubles associated with that drug as well

DR CATTELL There are two other methods which have recently been proposed. One is chilling the area of injection. An ice pack was put on the shoulder for some time before and after the injection. This slowed the absorption so that the effective concentration could be maintained for a considerably longer period of

time Dr Bacon F Chow, of the Squibb Laberatory, reported that penicillin combined with albumin and under such circumstances, unlike the sulfenamides, the combination retained its normal activity Further, this preparation was retained longer in the blood stream

DR McDermott That second one has real promise The first one, I think, is again one of these trick methods for saving peniellin I would just as soon have repeated injections as

have an ice bag for twelve hours

STUDENT Is there any danger from caremonia when penicillin is given in beeswax to slow ab-

corntion?

Dn Medlemorr Nolody knows that Beeswax has been used as a velucle for a number of agents for the past four years. From that experione and from animal experimentation the evidence is that the beeswax is metabolized Hewever, it chould be emphasized that the definite answer is not at hand

DR. CATTELL Have vasoconstrictors been

DR MoDERMOTT At Bethesda absorption has been delayed by the use of comephrine

DR SULERGIER Have the things Fround pointed out, such as the aquapher, preparations, been used to slow absorption?

DR McDermorr I den't knew whether that one has or net. I think it would be a pretty safe statement to make that all of the knewn absorption inhibitors have been tried. Romansky listed a number that have been tried, and it was an impressive list.

Dn Modell. Has there been any attempt made to recover penicillin for use from the urine?

DR. McDernorr That had been suggested Production methods have new advanced so far that it can be made mere easily than it can be recovered from the urine

Dn CATTELL About 60 per cent can be recovered?

DR MeDermott Probably more probably up to 90 per cent. The original figures on that were too low

STUDENT How is penicillin exercted by kidney?

kidney?
De MeDenuorr Through both tubules

and glomeruli

DR WALTER MODELL You were very definite about there being ne resistant strain of genococcus. De you believe that other strains resistant to penicillin cannot be developed?

Dr. MeDeratorr Certain staphylococci are naturally resistant to penicillin. Most of those staphylococci so far have not been especially virulent, for some strange reason, that is, they have not been associated with bacteremia. Dr Monell. What about the development of resistance?

DR MeDermott With the development of resistance we are gotting into genetic problems, 1c, whether the organism develops resistance or whether we breed out the resistant ones. Dr Oscar Cov, of Boston, has a very good point when he says that the first week that sulfonamide was used in Boston they did not got 100 per cent cures. There were always some patients with gonerrhea whom they did not our The difference is that, whereas in 1937 the sulfonamide failures in Dr Cov's cline would run around 15 per cent, but 1944 the failures are around 70 per cent, so the possibility that the more resistant organisms have been "bred out" is one which must be considered.

DR WHEELER What is the evidence that pencillin is superior to the sulfonamides in those conditions in which the organism is netably sensitive to sulfonamide, like pneumococcal pneumona, streptococcal septecmia, ote?

Dn McDernort In pneumococcal pneumona I think the only difference is—and I den't think this has been proved statistically—that an individual with an extremely severe pneumococcal pneumonia can be brought under control mere quickly with penicillin than with sulfadiarine The enly other advantage it would have would be in its lewer toxicty

DR WHEILER I am net speaking of that. I was wondering about the fact that the recovery rates queted for pneumococcal pneumonia treated with penicillin de net differ from those reported for sulfadiazine in comparable institutions.

DR MODERMOTT They do, Dr Wheeler I am glad you brought that point up I would say, and I think you would agree, that the mortality from pneumococcal pneumonia treated with sulfadianne in carefully treated patients would run mround 6 to 7 per cont. Would you agree to that?

DR WHEELER I was thinking of some good series, down around 5 per cent.

Dr. McDermott I am not talking about the Bellevue figures. They were never better than 10 per cent due to the type of climical material they get.

Dn Modell Dr Plummer reported around 4 per cent.

DR McDermorr That was for private patients. It makes a great deal of difference.

Dr. Wheeler I was assuming that the statistics on penicillin were largely from university hospitals

Dn CATTELL There is a great deal of interest in the question of local action. It seems that in the case of the sulfonamides it has become more and more apparent that when the drug is given systemically it gets to the infected area very satisfactorily

Penicillin, which does not get into the cerebrospinal fluid to any extent, is still very effective in treating cerebrospinal meningitis. I wonder if the local effect is going to prove of much importance when the drug can be given systemically

DR McDermott Meningitis is still a problem, Dr Cattell It is true that under ordinary conditions penicillin does not get in the cerebrospinal fluid

If one gives massive doses of penicillin resulting in high blood levels for a period of four or five hours, one can then get a minute amount of penicillin into the spinal fluid, not enough to take care of a serious meningitis, but an amount which would inhibit the meningococcus in a test tube. In neurosyphilis it is perfectly obvious one need not give penicillin any other way than systemically. As a matter of fact in some cases of acute syphilitic meningitis systemic penicillin has been quite successful, and patients with meningitis due to other organisms have been treated without it being given intrathecally

However, there have been a few instances of patients developing meningitis when they were receiving systemic penicillin therapy. Therefore, at the present time, at least in pneumococcic meningitis and probably in all instances of purulent meningitis, it is advisable to administer the material intrathecally as well

DR CATTELL On theoretic grounds it might be assumed that only living cells are concerned and the organisms in the cerebrospinal fluid might not be of much importance

DR McDermott I think that is true of the central nervous system

DR CATTELL All living cells get ovygen and must be in close touch with the blood supply

DR KOTEEN Have you anything to say about the response of virus infections to penicillin?

DR McDermott As far as I know there are no virus infections which have been shown to be susceptible to penicillin

DR WHEELER How about the one that is the cause of idiopathic glaucoma?

DR McDermott I have never been convinced in the case of idiopathic glaucoma How about it, Dr Sulzberger?

DR SULZBERGER I don't know about that There is a form of conjunctival virus infection in which the sulfonamides act. There are other places where they don't quite parallel pencillin, for instance, in chancroid, which generally does not react to pencillin

DR McDermott There the evidence is

equivocal Some people say they do and some people say they don't

DR SULZBERGER Certainly not as well as they do to sulfonamides

STUDENT Would you say something about local application such as the intranasal administration of penicillin which has been recently reported?

DR McDermott In contrast to the sulfonamides, penicillin is effective locally Whether it is the best method of giving it is still a moot question

As far as the intranasal method goes, I am against it largely on grounds of prejudice, and my prejudice is based on the following considerations in bronchiectasis, there is an anatomic condition unfavorable to drainage from the infected area within the bronchi. One also has a surrounding area of pneumonia of greater or lesser extent. It would seem to me much more logical to attack that with systemic therapy

The other objection to insufflation is that the material we are giving is still crude. It is about 50 per cent pure, and sensitivity reactions to penicillin are not at all uncommon. One does get reasonably high serum concentration by use of the nebulizer, yet I would feel that we can and will develop simpler methods for home administration.

DR WHEELER Are there any recognized toxic effects of penicillin other than drug fever and skin rashes?

DR McDermott Yes, we have had in this hospital one serious reaction to penicillin therapy, which is, as far as I know, the only serious reaction to penicillin therapy which has occurred anywhere

A patient developed a delayed anaphylactic reaction of the clinical type formerly seen following administration of horse serum. As a manifestation of that pseudo scrum sickness he developed a severe peripheral neurities of the proximal muscles of the shoulder girdle with atrophy

DR CATTELL Was that proved to be due to penicilin?

DR McDermott To the antibacterial factor in penicillin?

DR CATTELL Yes

DR McDermott No, the only way to prove that would be by using the crystalline material

DR HARRY GOLD Is there any real danger in the reactions which occur in the treatment of early syphilis? I understand they do get pretty sick for a period

DR McDermott They get a Her heimer reaction but it is not serious. They also have that with arsenic. It is merely an intensification of the syphilitic inflammatory tissue, i.e., the

rash or chancre, for an hour or two, it leads to some temporary discomfort but no harm

DR MODELL In local application does pencillin retard wound healing? I suppose it might if it were put on a sterile wound

DR McDERMOTT Not if the concentration is proper Of course, there the experimental results are not quite comparable. When one sees the various bottles of penicillin which one gets from the various drug houses, it varies all the way from a canary-yellow powder to solid molas ses, and it is all "penicilin". If one did a wound study with some of the molasses stuff and a wound study with some of the canary-yellow, the results night vary

The reports are that it has no effect However, concentrated penicillin solutions are quite

irritating

DR. CATTELL In the early experiments it was tried in quite high concentration in testing its action on leukocytes It is surprising how little they were affected

Dr. Modell What about other antiblotics,

as substitutes for penicillin?

DR. McDennorr I think the only one that holds any promise at all in systemic infections is streptomycin. All the others are merely highgrade poisons that can be used locally but have no value systemically

DR. MODELL Would you not expect a series of developments like those which followed the in-

troduction of sulfanilamide?

DR. McDERMOTT I see no way of predicting it. We may go through another forty years without a single advance in the chemothempy of infectious diseases, or the next decade may be similar to the period of the last ten years

DR. WHEELER In relation to the matter of dosage, what would you consider a desirable

blood level?

Dr. Moderntoff I would say at the present time for most infections 25,000 units overy two hours will give one a more or less continuous serum concentration of 0 078 or better, and that will take care of most of the acute infections and most of the subacute infections. There will be a few exceptions to that—certain of the cases of nonhemolytic streptococcic endocarditis and certain of the staphylococcic infections.

DR. CATTELL Does that apply to syphilis?

Dr. McDremorr I think that probably applies to syphilis, from such evidence as we have from the hehavior of the patients with infectious syphilis and from the behavior of the Reiter's strain of spirochete in the test tube the spirochete falls just a little bit above the Group-A streptococci in terms of sensitivity to penicillin.

DR. CATTELL There has been considerable revision in the ideas of desage in syphilis, has there not, or is that only in relation to the time over which the treatment is given?

DR. McDermott No, there has not been any considerable revision Tho original regimen of Dr. Mahoney's was a seven-day regimen of 1.2 million units. That is associated with a relapse rate of about 71 per cent, which is as good as, or better than by any previous system. However, ridiculously small amounts were tried out with the idea of saving pencillin. One regimen consisted of a total dose of as little as 60,000 units over a seven and one-half day period. This was quickly discarded. The present regimens run from 1.2 million to 3 4 million units in one or two weeks.

I believe that the ideal treatment period will prove to be between ten and fourteen days

Da. CATTELL I think Keefer's original recommendation regarding blood levels of penicillin was that it should be between 0.02 and 0.10 of a unit per cc Is the 0.02 level now considered to be too low?

Dr. McDermott No, 0 02 will inhibit completely the more sensitive organisms such as Group-A streptococci, pneumococci, and a number of others. At least some of the nonhemolytic staphylococci require as high as 0 17 unit per cc.

Dn. SULMISIGER Dr McDermott, to come back to syphilis for a moment, is it true that the therapeutio efficacy of penicilln in early syphilis is really no greater than that of the highest intonuve-treatment deeage with the arsemicals and hismuth, and that the advance is not that syphilis is oured botter but that there is less to custy?

Dr. McDemiorr Oo the basis of the work which has been done up until today that statement is correct. However, there is real hope that in the future tile statement will not be correct. The relapse rate is down to 7 per cent now, which is as good as by the other treatment, and one can hope, giving more prolonged thempy or possibly more intensive therapy, that we may bring the relapse rate down to 2 or 3 per cent.

Dn. SULZBERGER The reason I ask that is because there is general misapprehension on that point. Laymen, and physicians also, sometimes draw the conclusion that a higher percentage of cases of syphilis are cured by this method

DR MoDERMOTT We had an excellent agent before penicillin. With penicillin we can now achieve results comparable with those achieved formerly It is a question, from now on, of attempting to better those results

Dr. Wescoe I have two questions to ask.

Do you know anything about the mechanism of the action of penicillin, and second, do you know any indications for its intravenous use?

DR McDermott I will answer the second question first I know of no indication for intravenous use, save if the patient is in severe shock. Certainly normal people, that is, people not in shock, get high serum concentrations within five minutes following an intramuscular injection. I question whether a man who is in profound shock would do that. So, if in doubt, I would give the first injection intravenously and the others intramuscularly.

As far as the mechanism of action is concerned, I know nothing other than the broad concepts of Dr René J Dubos and others, which are familiar to you. The penicillin enters into the economy of the organism in some way and brings about death, but precisely how this is effected is not known.

DR MODELL Do the arsenicals have any effect on the patient with syphilis not cured by penicillin?

DR McDermott I don't know, because the exact experiment to answer that question has not been done. It is true that a small amount of penicillin and a small amount of arsenic can produce an amazing effect in the treatment of early syphilis. By that I mean that if you give 350 mg of arsenic total and 300,000 units of penicillin, the relapse rate both in rabbits and man is well down, around 7 per cent. I don't think that the method has any practical advantage.

DR CATTELL Does not your question, Dr Modell, relate to whether the organism is resistant to one drug and not to the other?

DR McDermott I don't believe that the 7 per cent of patients who relapse have resistant organisms. I believe that they were not treated long enough, and the same is true of those treated with arsenic. So we may assume that they would respond to a second course of arsenic One thing we do know, and that is that the penicillin relapsers have responded to a second course of penicillin perfectly well.

DR WHEELER Is it true that penicillin actually kills the organism, its effect being different from that of the sulfonamides, which are thought merely to prevent their multiplication?

DR McDermott You get into the definition of terms there, Dr Wheeler It is true that in experimental animals one does not require the bodily defenses to secure the effect of the penicillin, as is necessary with sulfonamides So, in that sense, it is true that penicillin actually kills the organism and sulfonamide does not However, if penicillin and the sulfonamide both blocked the same enzyme system, and one were a thousand times more powerful than the other, it

might be difficult to distinguish grades of inhibition

DR GOLD Are you doing anything at the present time in connection with the possibility of developing fastness in any of the long-drawn-out infections requiring the use of penicillin?

DR McDermott Dr Loewe believes that in bacterial endocarditis the danger is very real. In our own less extensive experience we have seen no evidence of the phenomenon

DR GOLD How about staphylococcus osteomyehtis?

DR McDermott I think if the danger were very real there we would have begun to get some evidence by now, Dr Gold, because, as you know, the patients with the staphylococcus infections were really the first patients to receive penicillin therapy on any scale and have hence been followed for the longest period

## Summary

DR CATTELL Penicillin, after only a few years of clinical trial, is now established as our most important agent in the treatment of infections

In this conference it has not been possible to cover in detail the application of penicillin therapy in the wide variety of diseases in which it is employed, or to consider more than a few of the many considerations which determine the most effective regimens of therapy mercial preparations of penicillin are not chemically pure and the potency of each batch is determined by assay of its effectiveness on bacteria according to a standardized technic potency is expressed in terms of units of activity, one umt being equivalent to that of 06 mg of pure crystalline penicilin Different batches vary in their activity, depending upon the degree of purification, but in general do not exceed 50 per cent of the pure material, which has a potency of 1,650 umts per mg

Not only is penicillin effective in practically all acute bacterial infections, but it is of value in the treatment of many chronic localized infections for which in the past we have had no satisfactory therapy. These include pneumococcal empyema, cavernous sinus thiombosis, endocarditis, gonococcal arthritis, and osteomyelitis. The use of penicillin has reduced but not eliminated the need for surgical drainage in many local infections, e.g., in some cases of empyema aspiration is all that is required. Penicillin is not effective in urinary infections with B coh and in certain bacillary infections of the genitourinary tract, nor is it useful in virus diseases.

Thus, a number of potentially serious infections, many of which were satisfactorily treated with the sulfonamides, are now being even more satisfactorily treated with penicillin, and with less risk to the patient.

A number of points relating to the conditions giving optimum effectiveness in penicillin therapy were discussed

Evidence was presented in support of the following statements

1 If penicillin is continued only until the disappearance of all symptoms and signs of the infection many cases will relapse after a fow days in neute, and after mouths, in subjects infections, hence the importance of sufficiently prolonged treatment.

2 The important factor in pencellin theraps is the maintenance of an effective concentration in the blood, high peaks above this contribute

little, if anything, to the outcome

3 Injection by muscle is usually the route of choice, and by incorporating pencillin in peanut oil and becawar, the addition of epinephrine, and various other procedures prolonged effective blood levels are obtained without the high reaks

4 Sufficient peniculin must be given to maintain a blood concentration of from 0.02 to 0.16 units per to This requires about 25,000 units every two hours. In the case of subacute bacterial endocarditis the optimum level is probably in excess of this range.

5 In contrast to the sulfonamides, penicillin is effective when applied locally and its bacteriostatic action is not inhibited by the presence of pus. In most cases, however, systemic administration is nt least as effective and the preferred

procedure

6 Toxic reactions are relatively uncommon but fover and intricaria occurrenally occur and one serious reaction resembling serum sickness was reported. It is still an open question whether or not the reactions are due to penicillin or to the impurities present.

7 There has been very little evidence of the development of penicillin-resistant infections, although the phenomenon has been observed in

cultures.

### MEDICINE IN ANCIENT MESOPOTAMIA

The civilization of the Sumorians, the oldest and the most important of western Asia was at its zeaith in 3000 B C., says the Medical Journal of Aus-Their medicine, animistic and sacerdotal, was based on astrology and prognosis and treatment depended upon the gudance of the stars. center of Sumerian civilization was the temple and the king who was also the high prest and the chief of the magicians was from that fact the grand master of the doctors. Treatment was based on plival cal and spiritual hygiene Water and fire were the Mesopotamia was con chief purifying agents quered by the Accadians in 2,00 n c but Sumoran culture survived and remained the foundation of Assyro-Bahylonian civilization Clay tablets from the library of King Assur ban pal of Assyria and the code of King Hammurahi of Babylon, at preent lu the Louvre are remarkable documents from the medical point of view From the scals of one or two great physicians we learn that certain doctors were appointed to positions of importance in the State.

Moreover the letters of the most famous dectors of the Assyran court are available from them we learn of their medical doctrines. Their medicine like Sumeran medicine was secretotal and was practised by doctor presta. The legends all point to the Assyrana's symbolic attitude to life and to their constant procecupation with immortality. According to their kelief, man was the son of the god who gave him life. Thus if a man fell ll, he had to call upon one of the creator gods and ask of him deliverance from his trouble and purification from past sins (for illness was always the result of sin or impurity). Brought about by one

of the countless demons and malign spirits that haunted the imagination, or by an evil spell cast by a sorecrer the sickness had to be combated by natural nad magic means. The doctor's task as soon as he was called to the patient, was to discover the causes of the illness. He inquired into past misdemennors into the patient's thoughts, into his fears of heing possessed. The doctor then decided upon the nature and extent of the demon illness. If the doctor was mahle to solve the mystery of the illness recourse was had to divination. tion of the stars, the interpretation of dreams and the offering of sacrifices were carried out with scrupulous attention to ritual and is accordance with tradition. When a sacrifice was offered, the organs were examined, the first thing noted was the state of the liver which is belleved by all oriental peoples to be the vital organ and which the Chal deans held to be the seat of the soul of investigation was pouring oil on water and not ing the various patterns that it made.

When a dusquosis was made treatment consisted first of all in reconciling the patient with his god and then the demon illness could be driven out. Prayers and lavocations to the angry gods were collowed by certain purifying rites and by expactory esonfaces, a kid or a lamb being offered. The patient was sprakled with fresh water, "washed of his sins," and the illness was destroyed by magic forces, as fire huras and purifies a handful of grains of whent. The a at last good health, evidence of a hlameless life and of the presence of his god in the man, was once more restored. He who obeyed the divino law and led a his free from sin should remain in health and live long,—M Res., May 1936

# Constructive Program for Medical Care

## American Medical Association,

This platform was adopted by the Council on Medical Service and Public Relations and the Board of Trustees of the American Medical Association on June 22, 1945

### Preamble

The physicians of the United States are interested in extending to all people in all communities the best possible medical care. The Constitution of the United States, the Bill of Rights, and the "American Wav of Life" are diametrically opposed to regimentation or any form of totalitarianism. According to available cyidence in surveys, most of the American people are not interested in testing in the United States experi-

ments in medical care which have already failed in regimented countries

The physicians of the United States, through the American Medical Association, have stressed repeatedly the necessity for extending to all corners of this great country the availability of aids for diagnosis and treatment, so that dependency will be minimized and independence will be stimulated. American private enterprise has won and is winning the greatest war in the world's history Private enterprise and initiative manifested through research may conquer cancer, arthritis, and other as yet unconquered scourges of humankind Science, as history well demonstrates, prospers best when free and unshackled

### Program

The physicians represented by the American Medical Association propose the following constructive program for the extension of improved health and medical care to all the people

Sustained production leading to better living conditions with improved housing, nutrition, and sanitation, which are fundamental to good health, we support progressive action toward achieving these

objectives

An extended program of disease prevention with the development or extension of organizations for public health service so that every part of our country will have such service, as rapidly as adequate personnel can he trained

Increased hospitalization insurance on a voluntary hasis

The development in or extension to all localities of voluntary sickness insurance plans and provision for the extension of these plans to the needy under the principles already established by the American Mcdical Association

The provision of hospitalization and incdical care to the indigent by local authorities under volun-

tary hospital and sickness insurance plans

A survey of each state by qualified individuals and agencies to establish the need for additional medical care

Federal and to states where definite need is demonstrated, to be administered by the proper local agencies of the states involved with the help and advice of the medical profession

Extension of information on these plans to all the people with recognition that such voluntary pro-

grams need not involve increased taxation A continuous survey of all voluntary plans for hospitalization and illness to determine their ade-

quacy in meeting needs and maintaining continuous improvement in quality of medical service

Discharge of physicians from the armed services as rapidly as is consistent with the war effort in order to facilitate redistribution and relocation of physicians in areas needing physicians

Increased availability of medical education to young men and women to provide a greater number

of physicians for rural areas

Postponement of consideration of revolutionary changes while 60,000 medical men are in the service voluntarily and while 12,000,000 men and women are in uniform to preservo the American democratic system of government

13 Adoption of federal legislation to provide for adjustments in draft regulation which will permit

students to prepare for and continue the study of medicine

Study of pestwar medical personnel requirements with special reference to the needs of the veterans' hospitals the regular army, navy, and United States Public Health Service

# BLOOD PLASMA FIRED IN ARTILLERY SHELLS

Blood plasma was successfully fired in artillery shells to Allied troops cut off hy Nazis in Europe, reports Maj Gen Paul R Hawley, surgeon to the European Theater of Operations (Marine Corps Gazette, May)

This adds a new item to the list of many ways in which blood plasma has been delivered to American fighting men. In the past, plasma has gone to the front hy plane, ship, on horseback, and in jeeps, and it has been dropped from the air in parachutes

General Hawley reports also that preinvasion estimates of the amount of plasma that would be required to fill the needs of the Army were far too Instead of one transfusion required for every five men wounded, hattle experience has shown the need for one transfusion for every two mcn wounded

—Science News Letter, June 16, 1945

# Postgraduate Medical Education

Programs arranged by the Council Committee on Public Health and Education of the Medical Society of the State of New York are published in this Section of the JOURNAL The members of the committee are Olicer W H Mitchell, M.D. Chairman (428 Green wood Place, Syracuse), George Bachr, M.D. and Charles D Post, M.D.

### November Lecture on Gynecology

NOVEMBER 20 the Tompkins County Medical Society will have another postgradu ato lecture arranged by the Council Committee on Public Health and Education of the Medical Society of the State of New York. The lecture will take place at 8 30 r m in the Nurses' Home at Tompkins County Memorial Hospital, Ithaca

Nathan P Scars professor of gynecology at the Symcuse University College of Medicine will speak on "Gynecology in Conorm Practice" This instruction will be presented by the Medical Society of the State of New York with the co-

operation of the New York State Department of Health

### Low Back Pain

DOSTGRADUATE instruction, armaged by the Council Committee on Public Health and Education for the Tompkins County Medical Society, will be given on September 18 at 8 30 PM at the County Memorial Hospital.

Dr Frank N Potta, professor of orthopedic surgery at the University of Buffalo School of Medicino, Buffalo, will speak. His subject will be 'Treatment of Low Back Pain."

### DICHLORO-DIPHENYL-TRICHLOROETHANE

The effectiveness of the third wonder drug of the war (sulfonamides, penicillin, and D.D.T.) was discovered because of a change in the monsoon season in East Africa The Army had a satisfactory powdor that would keep a man free from lice for about a week. One of the ingredients of this powder was pyrethrum. The early appearance of the monsoon in 1942 curtailed the supply of this substance from Kenys the place from whence most of the pyrethrum came The result was that a search for a sub-

stitute was begun.
In 1874 Othman Ziedler, a young student st Strasbourg, synthesized dichloro-diphenyl-trichloro-ethane. This substance was first prepared com mercially in Switzerland, where it appeared on the market under the name gesarol. It was used to destroy certain agricultural pests. The Depart-ment of Agriculture called the military anthorities' attention to this compound and extensive studies of its insecticidal and lethal properties were under taken These tests showed that it could be safely used. D.D.T., as it is called in Army parlance, kills insects either when ingested or when it merely comes in contact with them. It acts as a nervous system poison. For instance mosquitoes after contact with an olly solution of D.D.T. show no signs of being poisoned at first. After about fifteen minutes they become agreated, take off a bruptly and fly about in erratic drunken circles. In from five to twenty minutes they drop to the floor paralyzed,

only to die several hours later This reaction is so characteristic that it has been called "gesarol ilttera, ' or D D T's

The effectiveness of this new powder lasts much longer than any previously used When a solder's clothes are thoroughly dusted with D.D.T. he will remain free from lice a month The repellent power of the clothing will last through several washings. The powder can be blown under the clothing with compressed air, so that the delousing can be done rapidly In Naples some dusting stations deloused 5 000 persons a day and in all more than 1,250,000 persons were treated. The effect was little short of muraculous. Not a single case of typhus has been reported among American troops in Italy although there were fifty new cases a day in Naples when the

invasion took place

DDT has varied uses. Dissolved in oil it is much more effective as a larvacide than anything formerly used. It is effective even when used in infinitesimally small amounts. In quantities ordinarily used it is harmless to fish, water fowl, and animals. We have seen it stated that dairy barns apmyed with D.D.T. would remain free from flees for as long as a month. Whether this is one of the fantastic atomes that were circulated after its adoption by the Arms, we cannot say After the war when it will be released for civilian use, it will un doubtedly find a great variety of uses.—I trginia M

Monthly, June, 1945

# Medical News

## Statement by the Council of the Medical Society of the State of New York

DURING the past session of the New York Legislature there was a bill introduced which was known as the "Anti-Vivisection Bill" This bill would have prohibited experimentation on dogs in the State of New York It passed the Senate but was not reported out of the Rules Committee in the This bill was furthered by a great deal of false and misleading propaganda intended to de-lude the legislators and the public

Had the bill been enacted, it would have been the greatest setback to the progress of medical science which has occurred since the study of anatomy of the liuman body was forbidden in the Middle Ages All right-thinking physicians are opposed to cruelty to animals, but rightly supervised experimentation is not cruel and every precaution is taken to prevent suffering Such properly supervised experimentation has brought about the greatest advances

in the treatment of disease

To mention only three of the advances from experimentation on dogs, let us consider diabetes, the plasma treatment of shock, and modern surgery The modern insulin treatment of diabetes would never have been possible without studies on dogs As a result the lives of thousands of children have been saved, for diabetes was formerly a very fatal disease in children, and the lives of thousands of adults have been prolonged and made happier Thousands of lives have been saved on the battlefield and at home in the treatment of shock by the

This also was worked out on degs use of plasma Many of the miracles of modern surgery had to be worked out on dogs first.

Animals themselves have benefited by the experimentation on dogs The propaganda issued by the supporters of this bill has deliberately ignored all this and has played up instances of unnecessary cruelty, which, if true at all—and this is doubtful are rare in occurrence and certainly have not been practiced by any medical school or any properly supervised research institution

Nevertheless, in view of the hysteria which was mahorously created by the backers of the bill, it took great courage on the part of those legislators who opposed its passage Medical science and the public owe them a debt of gratitude for their cour-

age

It has come to the attention of the Council of the Medical Society of the State of New York that Assemblyman Öswald D Heck, Speaker, Chairman of the Rules Committee of the Assembly, has recently been subjected to a scurrilous, smear campaign because his committee did not report out the bill The Council, therefore, wishes to go on record as commending the action of Assemblyman Heck and all others who opposed the passage of this permicious piece of legislation They are to be congratulated for their stand against the forces of ignorance, fanaticism, false sentimentality, and cynical irresponsibility

# \$100,000,000 Asked for Maternity Aid

A BILL providing a \$100,000,000 maternal and child-health program, in accordance with recommendations recently announced by the National Commission on Children in Wartime, was introduced in the Senate on July 26 by Senator Claude Pepper, chairman of the Subcommittee on Health and Welfare, and mne other members of the Education and Labor Committee under which the Pepper Commuttee functions

The bill would extend within ten years to all women wishing it the same inclusive maternity care now being given to the wives of servicemen in the four lower-pay grades under the Emergency Maternity and Infancy Care Program, to be administered by the Children's Bureau as a permanent

part of the Social Security Program

The bill provides \$50,000,000 annually for a program of maternal and infancy care, patterned in general after the E M I C system, under which 845,000 servicemen's wives and babies have received medical care, and under which the birth expenses of one out of every six of the current baby population have been paid. The scope of the program would, however, be broader than that of the EMIC and would include the correction of defects of school children and youth and health services for them

In addition, the legislation would, under a \$25,-000,000 title, provide complete medical care to all crippled and handicapped children, many of whom have been demed, for lack of State funds, treatment to which they were entitled under the Social Security Act Under a third title a \$20,000,-000 welfare program would be set up designed to curb delinquency The remaining \$5,000,000 asked

would go for Federal administration of the Federal-

State grants-in-aid program

Each title would be administered under a system in which the States would pledge themselves to extend the program each year until it became statewide, agree not to permit race discrimination and assure able administration Funds would be matched dollar for dollar on the basis of proportional child population, but other funds would be allocated on the basis of local medical care costs, special maternal and child-health problems, and the financial need of the State

Senator Pepper explained that the bill was not in conflict with proposals for broader medical care for all the people, but rather might serve as a prelude to a "total medical-care plan designed to lift the

levels of health and medical care" "Cluldren do not wait to grow until the nation decides what kind of a national health program it will have," he said "We can learn much that will be of use to us later in dealing with the larger problem by pushing ahead now with this more limited measure

The anti-delinquency program to be set up under the bill would provide temporary care for children who otherwise would be detained in jail, and payment of costs of returning runaway children to their own communities if costs could not otherwise be met

The co-sponsoring Senators were Walsh, of Massachusetts, Thomas, of Utah, Hill, of Alabama, Chavez, of New Mexico, Tunnell, of Delaware, and Guffey, of Pennsylvania, Democrats, La Follette, of Wisconski Physical Research of Wisconsin, Progressive, and Aiken, of Vermont, and Morse, of Oregon, Republicans

### Research Aid Bill Offered in Senate

A BILL to create a central scientific research agency of the Federal Government, to be known as the National Science Foundation, was introduced on July 23 by Senators Kilgore, of West Virginia Pepper, of Florida, and Johnson, of Colorado, all Democrats.

It followed the recommendations made by Senator Kilgore's subcommittee on War Mobilization and had these specifically declared purposes

"To provide for an increase above prewar levels in the government's support of research and development in fields that are predominantly in the public interest, particularly national defense bealth and medical science and the basic sciences.

"To provide for an efficient coordination of Government-supported research activities

"To stimulate a general expansion in research by

private organisations and institutions
"To promote a wider flow of scientific and tech

nical information which may be useful to industry and agriculture and business, particularly small enterprises.

"To encourage a rapid introduction and full use of scientific discoveries and the most advanced techniques and inventions.

"To encourage the training of new scientific talent through a system of research fellowships and scholar ships,"

Senator Kilgore pointed out that a number of

bills intended to improve postwar research already were pending, adding that he would propose joint hearings before the Senate Military Affairs Committee so that all could be compared and some agreement reached.

Senator Pepper stressed the aid to medical research proposed in the bill, saying that here, too, the country had often been dependent on German "seorets" A committee of nine would be formed to carry on after the war the functions of the present committee on medical research of the Office of Scientific Research and Development.

Vir Popper asserted that while money was "desperately needed" for improving medical research "almost more than that security and long term accontives and organization are needed for men and women working in this field"

Many philanthropie organisations, he added, because of their limited funds had been able to give only short-term grants and "bare subsistence salance or fellowships."

Establishment of a National Research Foundation was recommended by Dr Vanevar Bush, director of the Office of Scientific Research and Development in a report to the White House made public on July 18. With Federal financing starting at \$33,000,000 a year this foundation would support basic research and develop trained personnel in colleges and other nonprofit institutions.

### 15 Drug Makers Raise \$84,000 Penicillin Fund

A TRUST fund totaling more than £20 000 hout \$34 000—has been raised by fifteen manufacturers of penticillin to be used for scientific research at St. Mary's Hospital Medical School, University of London under the direction of Sir Alexander Flemms, discoverer of penticilin

ander Fleming, discoverer of penicillin Creation of the trust, to be called the Alexander Fleming Fund, was announced by the penicillin producers on July 25 although Sir Alexander was notfied of it at a dinner given in his honor in the Wal dorf Astoria by the manufacturers on June 25

A second honor, the award to Sir Alexander of the 1944 Humanitarian Award of the Variety Clubs of America, brought a message from President Truman in Potsdam, in which the President praised the scientists as a man to whom "the world owes a debt of gratitude difficult to estimate" The award was made and the message read in Washington,

The Alexander Fleming Fund, meeme and principal, will be administered under Sir Alexander, who is given "the widest latitude" according to the announcement. Results of rescarch made under the fund will be available without charge

Companies that contributed to the fund include
Wyeth Inc. Ben Venue Laboratories, Inc. Cheplin
Laboratories, Inc., Commercial Solvents Corp,
Hoyden Chemical Corp, Hoffman-La Roche, Inc.,
Ell Lilly and Co. McKesson and Robbins, Inc.,
Merch and Co., Parke, Davis and Co., Chas
Pfirer and Co., Inc., Schenley Laboratories Inc.,
E. R. Squibb and Sons, the Upjohn Company, and
Winthrop Chemical Company, Inc.

### Reports Wide Need of Women Doctors

W Oblen physicians will have a much larger part in filling postwar medical needs than they had in the past, the Women a Bureau reported on July 22. They constituted less than 5 per cent of the 165 000 physicians practicing before the war Declaring the postwar demand for physicians of

all types would be great, the bureau said
"There seems to be general agreement that the
women now studying medicine are likely to have
greater rather than iess opportunity than those who

preceded them"

The report said the war had increased tremendously the demand for women physicians, both for work in the Army and Navy and in replacing de-

tors who had gone to the armed services. Also, only four out of the seventy-seven approved medical schools in the country now refuse admission to women.

While women had tended to specialize in pediatrics, psychiatry, and public health they would expand into other medical fields after the war, including medical research and teaching, it was stated.

The report contended there had never been a time when adequate medical care was available to all the population in 1940 it was said, one physician served about 600 people in the Northeastern States, 700 in the West, 800 in the North Central region, and more than 1,000 in the South.

# Public to Receive DDT Insecticide

).DT, the insecticide, has been made available in small quantities for civilian and agricultural users beginning in August, by the War Production Board

Heretofore distributed only to the armed forces and experimenters, DDT will go to the public in limited quantities as long as military requirements remain at current levels, the WPB said

A special grant will be made to the Public Health Service of the Federal Security Agency for Programs designed to control disease-carrying insects

The potency of the chemical was emphasized by Sievert A Rohwer, assistant chief of the Bureau of Entomology and Plant Quarantine of the Department of Agriculture He said

"Industry has a privilege and a responsibility, and must use D D T wisely, both in the interest of

public welfare and for the good of the industry
"There is a great deal that is yet to be learned about how to safely use D D T insecticides, from the standpoint of hazard to the user, the consumer of products on which residues may occur, the effect they may have on soils and on the whole balance of nature in terms of beneficial insects and wild life "

The Department of Agriculture, through the chief of its chemical and fertilizers branch, Dr G F MacLeod, reported that it would not require D D T for specific use unless these requirements were fulfilled

The crops of animals to be protected must be an

important part of the food program No other insecticide is satisfactory, or satisfactory

insecticides are not available.

Use is officially recommended by the Bureau of Entomology and Plant Quarantine of the Department of Agriculture or by a State official

The person responsible for making the recommendation and requesting its allocation should indicate his willingness to keep a watchful eye on its use so that it will not involve quantities in excess of those approved and actually needed

It should be determined and stated by a qualified official that no deleterious residue problems will be

involved in its use

Similarly, a qualified official must indicate that the danger of poisoning bees, of upsetting the bio-logic complex, is not such as to create a hazard in the proposed use of D D T

## Ophthalmology Exam Postponed

UE to transportation difficulties the examina-tion of the American Board of Ophthalmology, originally scheduled for Chicago, October, 1945, has been postponed to January 18-22, inclusive The exam will be held in Los Angeles from January

28 to February 1
The New York exam will be during May or Junc

### San Marino Receives an U.N.R.A. Ambulance

FULLY equipped ambulance was formally A turned over to the Republic of San Marino on July 27 by Lt Col Vincent B Lamoureux, of the UNRRA. Italian Mission Medical Division This is the first contribution under the agreement signed recently with UNRR.A. whereby the small republic is to receive assistance up to \$30,000

Medical supplies transported in the ambulance included penicillin, insulin, DDT insecticide powder, vitamin-C tablets, ether, calcium, gluconate ampules, phenobarbital tablets, sulfadiazine cintment, bandages, cotton gauze, suture catgut, syringes thermometers forcers blankets sheets. thermometers, forreps, blankets, sheets, syringes, powdered and condensed milk, and sugar

# County News

### Albany County

Appointment of Dr Frank Edward Coughlin, of Albany, to the State Board of Medical Examiners to replace Dr Paul B Brooks, Albany, whose term has expired, was announced on July 28 by the State Board of Regents

The board met on July 27 in New York City with a newly named advisory committee to assist the Education Department in developing programs on arts

and handicrafts in schools, institutes, and colleges Resignation of Claude Van Wie, Saratoga Springs, from the committee to prepare Regents' examina-tions was followed by appointment of Herbert I Oakes, Chappaqua, to take his place \*

### Cattaraugus County

Dr Clarence A Greenleaf, medical director in the Olean schools, was re-elected as president of the New York State Association of School Physicians at a meeting of the executive board of the associa-tion on June 28 in Syracuse Dr Greenleaf completed his first term as president of the group this year '

### Chenango County

Dr J Mott Crumb was re-elected chairman of the Chenango County unit of the National Founda-tion for Infantile Paralysis at the recent annual

meeting held in Norwich

Other officers for the year include Dr John H Stewart, first vice-chairman, G Clayton Dutton, second vice-chairman, Mrs George McMullen, secretary, and John L Nash, treasurer Others elected to the executive committee are Edward S Moore, Dr E F Gibson, Clarence F Gaines, of Sherburne A Stanlay Burghard of Oxford William Sherburne, A. Stanley Burchard, of Oxford, William C Bennett, of South Otselic, Cyrus M Higley, and Mrs Dorothy Adwards \*

### Erie County

A resolution calling for amendment of the local health ordinance to ban the sale of sulfa drugs without a doctor's prescription was adopted unanimously by the Medical Society of Eric County on June 30 Copies were sent to Mayor Joseph J Kelly Council Branchest Transfer of William Kelly, Council President Kneeland B Hall Health Commissioner Francis E Fronczak, and Edward S Godfrey, Jr, state health commissioner Council President Kneeland B

<sup>\*</sup> Asterisk indicates that item is from a local newspaper

Calling attention to a similar amendment dealing with the sale of sulfa drugs in the sanitary code of New York City, the society asks Commissioner Godfrey to sponsor a bill in the 1946 Legislature making the sale without a prescription illegal

throughout the state.

"That the Medical So-The resolution states ciety of the County of Erie, hereby urgently recom mends that the health ordinance, known as Chapter 25, of the city ordinances of the City of Buffalo, be amended to prohibit the sale of sulfa drugs and sulfa-containing products for internal or external use without a physician's prescription, the ban on the unrestricted sale of these sulfa-containing prod ucts to become effective October 1, 1945, the latter being the date on which the sulfa-drug sales-control regulation for the City of New York will go into operation.

"It is further resolved," the resolution concludes, "that the health commissioner of the State of New lork be petitioned to initiate and sponsor a hill at the 1946 session of the New lork State Legislature making the sale of sulfa drugs or sulfa-containing products without a prescription illegal throughout

the State of New York

The meeting was the society's last session until

Appointed on June 30 by Gov Thomas E. Dewey to the New York State Temporary Commission on Medical Care Dr Harold F R. Brown, of Buffalo, informed the Governor of his acceptance of the des ignation and of his desire to further the purposes of the commesson, "the determination of sound state medical-care policies and programs in the interest of all the public.

The Medical Society of Eric County of which Dr Brown is a past-president, issued a statement de-claring the appointment shows recognition by the Governor of the society s contention that the com mission should include private practitioners as well as doctors with public institutions or in public serv

ice '

"Is an Infantile-Paralysis Epidemic Imminent?" was the subject of "Your Health and Happiness," new series sponsored by the University of Buffalo School of Medicine and the Medical Society of Erie County, broadcast over WBEN on July 14 nt 4 30 P.M. Participating in the discussion were Dr A. Wilmot Jacobson and Dr Thomas S Bumhalo, pediatricians, Dr Edward M Bridge, head of pediatrics research at the Children's Hospital, Dr John W hohl, attending orthopedist at Meyer Memorial Hospital, and Arthur I Goldberg, acting director of public relations at the university, who served as moderator

Dr Nelson W Strohm of Buffalo, was appointed on July 28 to the medical committee on grievances of the State Board of Regents. Dr Strohm filled the vacancy created by the resignation of Dr George R. Critchlow of Bullato who had served on the committee since 1941 \*

#### Franklin County

Dr Frank R. Ferlaino, of New York City was guest speaker on June 27 at the final meeting of the year of the county society, held in the John Black Room of the Saranac Laboratory

The meeting was well attended by physicians from Baranae Lake, Malone, Tupper Lake, and Plattsburgh. The afternoon's activities were terminated by a dinner at the Hotel Saranac

Dr John N Hayes, president of the society, presided at the session and introduced the speaker

Dr Ferlaino spoke on the newer uses of penicil lin and the possible use of it by oral administration rather than hy three-hourly injunctions. He de-scribed peniculin in peanut oil and becover and told of the possibility of peniculin in dormatologic ointment for the treatment of skin infections.

Dr Forlaino also discussed streptomyein, which is of value in treatment of infections caused by some penicillin-resistant bacteria. Although this agent is ouly available for experimentation, its value in animal tuberculosis treatment is said to be one of a definite suppressive action on the tubercle bacullus."

#### Genessee County

Dr Ralph B Smallman, practitioner in Corfu for the last twenty years and soon to open practice in Batavia, was the speaker at a luncheon meeting of the Kiwanis Club on July 5 "Chmate As Cure' was the title of his address

Saying he doesn't believe the southern climates can cure most diseases, Dr Smallman told of arriving in Arizona a few years ago, only to find a ventable epidemic of common colds among the residents of that supposedly healthful state. The speaker of that supposedly healthful state. The speaker asserted that hay fever influenza colds, and sinus trouble thrive in the southern regions as well as

they do here.
"It I were to put into equation form the formula for cure," the speaker said, "I should say that cure equals 5 per cent climate, 75 per cent care, and 20 per cent courage and the will to got better "\*

#### Greene County

For the first time in the history of the county society, a woman will head that organization, following action of the society on July 10 m nominating Dr Frances Persons Wiese, of Lexington, for the office of president.

More than thirty physicians and their wives were

present for the July meeting of the society, which was hald at the Sugar Maples, Maplecrest, Dr Edwan Mulbury of Windham, returing presi-dent presided, and Dr Wiese rendered the vicepresident's report, in which she stressed the publichealth angle the many clinics held in the county, and their advantages.

Guest speaker at the meeting was J Van Wie Bergamini, a native of Athens, and a missionary architect for the Episcopal Church who told of the experiences of himself and his family while prisoners of the Japanese. They were liberated from Bilibid Prison near Manila in February by the American

Army

Three scientific meetings will be held a year At the first meeting the speakers were Drs. Nathan Rosenthal, on "The Development of Hematology in New York City", Eugene R Marzullo, "The Role of the Hematologist in the General Hospital", and Lester J Unger, "Blood Banks of the Future"

Appointment of four associate deans at the College of Physicians and Surgeons of Columbia University was announced on July 29 by Dean Willard C Rappleye The appointees are Aura E Severing-haus and Vernon W Lippard as associate deans for medicine, Margaret E Conrad, associate dean for nursing, and Harry S Mustard, associate dean for public health.\* public health \*

Acceptance by S Sloan Colt, president of the Bankers Trust Company, of the co-chairmanship with Lewis W Douglas of the Memorial Cancer Contact Product Center Fund was announced on August 1 by Reg. inald G Coombe, president of Memorial Hospital for the Treatment of Cancer and Allied Diseases. The fund will be used to convert the hospital into the world's largest cancer center

When Mr Douglas, Mr Colt, and the business and industrial leaders who will assist them have completed their plans, the amount which will be sought by public subscription will be announced

Mr Colt said that Memorial Hospital "has led the world in the improvement of cancer treatment technics, in research, and in the training of cancer specialists." Its record, he said, made it reasonable to hope that if it received adequate support it might make "substantial progress toward finding the answer to the mystery of cancer"\*

Columbia University has announced that a series of postgraduate courses in clinical medicine will be given at the Mount Sinai Hospital beginning the week of October 22 A course in endocrinology and metabolism will be given from December 17-22, and one in recent advances in gynecology from November 12-17 Applications should be sub-mitted prior to October 8 For further information, address the Secretary for Medical Instruction, the Mount Sinni Hospital, Fifth Avenue at 100th Street, New York 29

Col Ralph Stewart Muckenfuss, M.D., officer in charge of the First Medical General Laboratory from June 28, 1943 to January 19 1945, was re-cently presented the Legion of Merit This high award n as granted in recognition of his exceptionally mentorious conduct in the organisation and main tenance of a laboratory to serve the European Theatre of Operations. Colonel Muchaniuss entered military service from New York, where he occupies the position of Director of the Bureau of Laboratories in the New York City Department of Health The citation accompanying his award reads in

part as follows
"Through the initiative and energy of Lieuten ant Colonel Muckenfuss, the lat Medical General Laboratory, the first organization of its type, was set up in the United Kingdom. The unit performed in a superior manner its mission of assisting all in a superior manner its mission of assisting all hospital laboratories performing laboratory examinations beyond the resources of hospitals, maintaining the only virus diagnostic laboratory in the United Kingdom, maintaining a veterinary laboratory, and investigating the canactive factors of epidemics. As United Kingdom Consultant in Research, Lieutenant Colonel Muckenfuss did much to further the scientific background of medical practice in the European Theatre of Operations. Under his supervision the only blood bank in the United Kingdom was organized"

The Board of Health at its meeting held on July 24 added a new section to the Sanitary Code restricting the sale of preparations containing pomeilin or other antibiotic drugs (preparations propared similarly to penicillin) to persons presenting a written prescription of a physician, dentist, podlatrist, or veterinarian except in the cases of preparations which the Board of Health at some future dato may specifically exampt from the pro-visions of this section The new ruling will become effective on August 1 1945.

Health Commissioner Ernest L. Stebhus in revealing this move, gave three principal reasons for the Board's action The indiscriminate use of penicillin and other antibiotic drugs might be dangerous One of the hazards is that undertreatment may alleviate the symptoms of the illness without curing the disease which, in turn, may conthue to be communicable to other persons and to produce damage to the infected person. Another reason given by Commissioner Stehbins was that "there is also accumulating evidence of possible importance of the development of penicillin fast strains in persons who are inadequately treated. Finally, the Board took this action because these antibiotic drugs have been recently developed and there has not been sufficient time to determine the possible toxic reactions If at some future time the Department finds that some preparations containing antibiotic drugs are entirely harmless yet effective in the treatment of certain diseases, the matter of exemptions will be reconsidered by the Board of Health."

Dr Stohbins revealed that the Department had conferred with representatives of the drug industry at a special meeting on July 17, and that there was general acceptance of this type of control
The new Section 118a of the Sanitary Code as

adopted by the Board of Health follows "Sale of Antihlotic drugs regulated

"Penicellin and preparations containing penicillin and other antibiotic drugs shall not be sold at retail or dispensed or given away to any person in the City of New York except on the written prescription of a physician, dentist, podiatrist, or voterinamen unless specifically exempted from the provisions of this Section."

#### Onondaga County

Officers of the New York State Association of School Physicians were re-elected at a meeting vesterday of the executive board in Syracuse

They are Dr Clarence A Greenleaf, of Olean, president, Dr Edgar Bleber, of Dunkirk vice-president, and Dr C Adele Brown, of Oswego, secretary and treasurer.

### Oswego County

Marshall William MacDuffie, M D, of New York City, died on July 23, at the age of 63 He gradu-ated from New York Medical College in 1904 and He later interned for two years at Flower Hospital served there as attending gynecologist, and obstetrician, lecturer on gynecology at the school for nurses, and assistant professor of gynecology He was an attending surgeon at Metropolitan Hospital and chairman of the advisory board and attending sur-geon at Park West Hospital He was a former president of the New York County Homeopathic Medical Society and a member of the State Homeo-pathic Medical Society, American Institute of Homeopathy, and the American Association for the Advancement of Science

Charles VanWert, M D, of New York City, died He graduated from Albany Medical on August 2

College in 1887

# Hospital News

# Dewey Acts to Get U S Hospital Help

GOVERNOR Dewey designated two agencies on August 2 to prepare an inventory and survey of needed hospital construction in the State and to formulate and carry out the State plan

This action was taken to make proposed new hospitals in the State eligible for Federal funds under the pending Hill-Burton Hospital Construc-tion Bill, which would provide Federal funds for the preparation of a State inventory and survey of needed hospital construction and a share in the cost of construction of "public and other nonprofit hospitals" erected in accordance with any approved

State plan

"In order to be prepared for the eventuality of the passage of this bill I propose that steps be taken now to prepare a State hospital inventory and survey of needed hospital construction," said Governor Dewey "Our Postwar Public Works Planning Commission is already authorized and, in fact, is now engaged in the survey and planning of needed construction, particularly of a public character Accordingly, I have today designated the Postwar Planning Commission as the single State agency for surveys as required in Section 612 (a) (1) of the Hill-Burton bill.

"We are constantly confronted in regular administrative problems with the need for a joint hoard of State Commissioners to coordinate many activities in the field of health, medical care, and welfare This is particularly required in the case of the pres-

ent hospital inventory and survey

"For this purpose, I am, at this time also, setting up a Joint Hospital Board composed of the Commissioners of health, mental hygiene, and social

I am asking Assemblyman Lee Mailler, who is chairman of the State Health Preparedness Commission, to serve with the joint board as an adviser

"This Joint Hospital Board shall act for and with the Postwar Planning Commission in making the necessary inventory and survey of hospital facilities

in the State

Such experts as are needed to carry out this purpose shall he employed with funds furnished by

the Postwar Planning Commission

"The Joint Hospital Board shall also utilize personnel, records, and data of the three State depart-Where necessary ments represented on the board to invoke statutory powers in the prosecution of the survey, the Joint Hospital Board may act through any one of the three State departments having the

The State Advisory Council required in Section 612 (a) (2) of the Hill-Burton hill will be designated by the Joint Hospital Board As required in the hill, this council will be composed of "representations." tives of nongovernment organizations or groups, and of State agencies, concerned with the operation, construction, or utilization of hospitals."

Federal aid for hospital construction will be of particular importance to New York State, which plans to spend about \$120,000,000 from its postwar reconstruction funds on its mental hospitals

The survey ordered by Governor Dewey will go Several cities, into every county of the State among them Schenectady, are conducting campaigns at the present to raise funds for new nonprofit private hospitals

# Blue Cross Membership Increases

R ECORDS continue to be broken in the number of Americans joining voluntary nonprofit plans for prepaying hospital hills A total of 2,282,482 new members joined during the first six months' period of 1945 and thus exceeded by more than 500,-000 the previous record membership growth established during the corresponding period of 1944

This announcement was made on July 27 hy Dr C Rufus Rorem, director of the American Hospital Association's hospital service plan commission, who stated that the total Blue Cross membership in forty-three states, the District of Columbia, seven Canadian provinces, and Puerto Rico now numbers

18,800,000 Americans
Whereas a year ago, new members were enrolling nationally at the rate of approximately 12,000 per working day, the rate has now increased to almost 17,000 persons daily More workers and family dependents joined Blue Cross during the first six months of 1945 than joined during the entire year of 1942

Six states have passed the million membership ark New York State leads with over 3,000,000 mark Blue Cross memhers, Ohio, 2,160,000, Pennsylvania, 1,933,000, Michigan, 1,303,000, Illinois, 1,222,000, and Massachusetts, 1,202,000 Ohio, 2,160,000, Pennsyl-

A state-wide Blue Cross plan has just been approved for New Mexico, which leaves only Arkansas, Mississippi, South Caroline, Idaho, and Wyoming without a community and hospital-sponsored plan for removing the financial worry of hospitalized

illness or injury

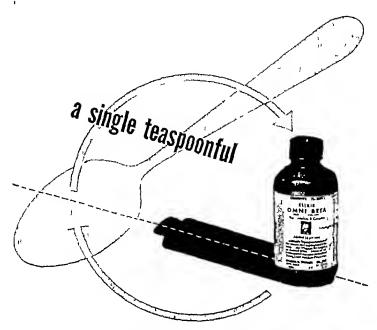

Doctor-bill prepayment plans sponsored by state and county medical societies and made available to the public through coordination with Blue Cross hospital service plans increased in number from 19 to 24 during the first six months of 1945 Memhership in these medical plans totals 1,800,000 Americans

# Improvements

Construction of the Rhoads General Hospital gymnasium was completed in July

Officials at the hospital said the expansion would increase the seating capacity of the auditorium, as the table tenns and billiard tables will be moved into the addition from the rear of the auditorium Plans for opening the gymnasium will be announced by hospital officials as soon as it is fully equipped \*

impossible to continue to serve

Making known Dr Poucher's resignation, Joseph L Schwartz, board president, expressed his regret and said, "Dr Poucher has served faithfully and loyally on the board for many years He has been most cooperative and faithful in his attendance "\*

### when persistent depression settles upon

benzedrine sulfate

Old age sometimes brings a severe and lasting depression, marked by self-absorption, with drawal from former interests and loss of capacity for pleasure. This characteristic doreasion often aggravates underlying pathology by interfering with exercise, appetite and sleep.

Because of its power to restore mental alert ness and sest for living Benzedrine Sulfate is of special value in the management of depression and anhedonis in the aged. Obviously careful observation of the aged patient is de strable and the physician will distinguish between the casual case of low spirits and a true and prolonged mental depression The dosage should be adjusted to the individual case.

The resolution for his appointment was presented

to the Jefferson County board of supervisors at its regular meeting on August 6, that body having jurisdiction over the appointment of sanatorium board managers

Mr Frink's appointment will be to fill out the unexpired term of Urban C Hirschey, of Carthage \*

## Newsy Notes

The Cortlandt Board of Trustees agreed at their recent meeting to write the Veterans' Administration requesting that the word "Peckskill" be eliminated in designating the Crugers Hospital.

In a letter from Scnator Robert Mead and Frank J Hines of the Administration, the Board was informed that the Crugers Hospital, Peekskill, will be named "The Franklin Delano Roosevelt Hos-

pital "\*

The Beekman Hospital and the Downtown Hospital, in New York City, will seek approval of municipal and state authorities to consolidate, it was announced on July 11 in a joint statement from Elisha Walker, chairman of the board of Beekman Hospital, and Percy C Magnus, president of Downtown Hospital

The decision to merge was voted yesterday by the board of directors of the two hospitals merger is approved, it is planned to build a \$2,000,-000 hospital of two hundred beds at a central location in the downtown district. The new institution would be named the Beekman Downtown Hospital and would be the only hospital serving that portion

of Manhattan lying south of Canal Street The district to be served by the proposed new consolidated hospital has a resident population of 50,000 and a daytime population in excess of 1,000,-

Plans to convert Memorial Hospital for the Treatment of Cancer and Allied Diseases, in New York City, into the largest cancer center in the world, as part of an attempt to conquer all forms of the malady, were announced on July 22 by Reginald G

Coombe, president of the hospital. Mr Coombe said the millions of dollars needed for the project would be raised by a public appeal to be conducted soon. He explained that when the new center was completed it would have six hundred beds, would be international in scope, and would cover the block bounded by York and First Avenues

and 67th and 68th Streets

The program embraces the following coordinated projects Enlargement of existing laboratories and addition of new ones, establishment of a fund for four-year cancer fellowships, enlargement of the present hospital building to provide space for three hundred bcds, extension of facilities for treatment to the present Strang Cancer Prevention Clinic and integration with the center of the three-hundred-bed Dr James Ewing Hospital for Cancer, which the city has contracted to build on Memorial Hospital

grounds
"This program will enable Memorial Hospital to carry on its responsibilities as the leading cancer center of the world," Mr Coombe said "The whole plan is so integrated that we can carry on intense research and at the same time give patients

the benefit of the constantly increasing skill and knowledge this research should develop. By this method the percentage of cures throughout the nation may be increased and relief provided where at present a cure cannot be accomplished "\*

The Hospital for Joint Diseases, in New York City, last year gave 5,504 bed patients 106,925 days of care and treated 19,843 ambulatory patients who made 151,003 visits to climics Frederick Brown, president, reported on July 23 in the hospital's thirty-eighth annual report Of the total service, 65 per cent was free or only partly paid \*

Thirteen trustees were elected at the annual meeting of the Oswego Hospital Corporation held on

July 16

The following have been nominated to serve a Time 30, 1948 Mrs term of three years, expiring on June 30, 1948 Mrs
John S Parsons, William A Allen, Earl D Brown,
Daniel A Williams, Mrs F D Culkin, Alfred G
Tucker, Miss Anna Post, A. C Hall, Rev Jeremiah
J Davern, and Rev Charles E Mathews Robert
L Allison has been nominated to serve a term of two years, expiring on June 30, 1947, while W W Wright and Frank McDonough are nominees for a one-year term, expiring June 30, 1946

The nominating committee has also nominated the following officers for the ensuing year president, George M Penney, first vice-president, Daniel A. Williams, second vice-president, Mrs. John Jermyn Downey, secretary and treasurer, Chester

M Jermyn

In addition to electing thirteen new trustees, reports of the officers will be presented Penney's report will cover an active year, telling of the reorganization that has been made at the hospital, including the establishment of a medical staff that is now functioning under the direction of It will also tell of improve-Dr Grover C Elder ments that have been made, including new v-ray equipment costing more than \$10,000 \*

Consolidation of the New York Orthopaedic Dispensary and Hospital and the Columbia-Presbyterian Medical Center was announced on July 23 as legal papers were signed at a ccremony in the Hotel Waldorf-Astoria

Charles P Cooper, president of the board of managers of the Presbyterian Hospital, explained that the new corporation would be known as the Presbyterian Hospital in the City of New York

The present board of thirty-three managers of the Presbyterian Hospital will continue intact, and nine of the eighteen trustees of the Orthopaedic Hospital

will become active trustees with the board of man-The others will act as honorary trustees

The Orthopaedic Hospital will remain at its present site until the fifth floor of the Presbyterian and Babies Hospital, part of the medical center, has been cleared of seventy student nurses housed there The facilities of the Orthopaedic Hospital eventually will be transferred completely and the building will be sold.

The seventy student nurses will live in two additions to Maxwell House, now being built as part of the medical center's \$8,000,000-\$9,000,000 expansion program Mr Cooper estimated that the program would take two and one-half to three years to complete

The documents for the consolidation were signed

by Mr Cooper and John Sloane, vice-president of the Orthopaedic Hospital. Mr Cooper declared that the merger was a "very important move for both hospitals"

"For Presbyteman Hospital," he said, "it is important because we have never completely developed our orthopedic service, perhaps one of the

few things now lacking in our hospital."

Mr Sloane commented that "we are very pleased to become associated with the Presbyterian Hospital and feel that this close association with a great teaching hospital will serve the best interests of the public '

Dr Alan DeForest Smith, chief surgeon of the Orthopaedic Hospital, will head the staff in the new location He said the move would "make it possible for us to advance in orthopedic surgery and in the teaching of it "\*

### AMERICAN SOCIAL HYGIENE ASSOCIATION ISSUES ANNUAL REPORT FOR 1944

Progress made during 1944 in the nation's wartime campaign against the venereal diseases points to the "great promise of still more far-reaching achievements in the future," Dr Walter Clarke, executive director of the American Social Hygiene Association, declared in a statement accompanying the Association's annual report for 1944

'If we are to take full advantage of present opportunities for a continued forward march against these curable and preventable diseases," Dr Clarke said, "it is imperative that (1) federal aid to the states is not seriously reduced after the war, (2) public opinion is aroused and organized to support all measures essential to the program, including especially the unremitting enforcement of laws for the repression of commercialized prostitution, and social, educational, and religious activities in support of high standards of sex morals, and that (3) improved diagnostic, treatment, case-finding, and educational programs be provided in the civilian population in order that all infected persons may receive adequate diagnosis and treatment"

The American Social Hygiene Association carried on its activities on a national level under the terms of an official agreement linking its efforts with those of the Army, Navy, United States Public Health Service, and the Social Protection Division of the Federal Security Agency

In helping to hold the line against commercialized prostitution as a major source of infections, the Association made more than six hundred studies of conditions in the forty-eight states and the District of Columbia, the report reveals More than 10,000 of these prostitution surveys were distributed to Army, Navy, and other Federal and state agencies, as well as to voluntary groups concerned with pro-tective measures for servicemen and war industry workers

Several thousand community programs were initrated or furthered through the cooperation of affiliated social hygiene societies, national voluntary agencies, state and local health and law enforcement authorities, social protection committees, parent-teacher associations, chambers of commerce, lodges, and other civic organizations interested in a broad Large quantities of edusocial hygiene program cational materials on the venereal diseases were supplied to the Army and Navy

Through joint management-labor efforts, educational work in war industries was intensified cial articles on venereal diseases appeared in more than one hundred trade-union newspapers and em-

ployee house organs

The annual report hails continued advances in methods of treating syphilis and gonorrhea as a most promising development. In regard to social hygiene legislation, at the request of interested groups in many states, the Association advised in the preparation of measures to be brought before state legislatures

At the end of 1944, the report says, thirty states had laws requiring doctors to give blood tests for syphilis to expectant mothers, and an equal number of states had laws requiring every applicant for a marriage license to have a bloood test for

syphilis "

# ANTIMALARIAL REQUIREMENTS OF DISCHARGED VETERANS

Everywhere in the United States

Veterans who have been in a molorious region are advised by the medical officers of aur Armod Forces to continue taking Atobrino dihydrochlorido in suppressive doses (1 tablet of 0.1 Gm daily) for at least four weeks after the last possible exposure.

If they develop a relapse of maloria, Atobrine dihydrochloride is administered in therapeutic doses (2 tablets overy six hours for 5 doses; followed by 1 tablet 3 times daily for six days) Suppressive medication is then continued for three months

# Army Hospitals Put Amputation Cases at 11,000

The War Department has revealed that on May 1, eight days before the European war ended, 7,000 amputation cases were in Army hospitals in this country and 4,000 had been discharged and returned to civilian life

Maj Gen Norman T Kirk, surgeon general, said none of them are so-called "basket cases," where all four limbs are completely lost However, he acknowledged that one man—a nonbattle casualty—lost parts of both legs and both arms as a

result of freezing after an airplane crash

Only six veterans have suffered the loss of three limbs, General Kirk reported Approximately 5 per cent of the amputation cases have lost more than one limb, and about three-fourths of these 500-odd cases are soldiers who lost both legs About half of these are losses below the knee Half of the arm cases are above the elbow

General Kirk said that the average soldier who has suffered the loss of a limb soon learns that such an injury does not prevent him from resuming a "self-respecting, useful role in society". Some of these soldiers, who were given the choice, wanted to remain in the service and have been assigned to assist

in the training of other amputees

General Kirk declared that the Army does "everything possible" for these soldiers in the way of helping them make their readjustment. Films are shown to give these men a glimpse of the future that is in store for them. One of these, called "Swing Into Step," is an encouraging portrayal of how the Army's program cares for a man and trains him until he is ready to resume a normal life.

It is not unusual for men with the loss of two arms or both legs to drive an automobile, ride horseback, use a typewriter, eat and dress without help, dance, and in general do almost everything they formerly

did, General Kirk said

# Director of UNRRA Attends Meeting in London

Dr Wilbur A Sawyer attended the Third Council Meeting of the United Nations Relief and Rehabilitation Administration held in London on August 7 Dr Sawyer was appointed director of UNR R.A.'s Health Division in April 1944

UNRR.A's Health Division in April, 1944
"The major problem facing the representatives of the United Nations at the UNRR.A Council this August will be to find ways and means for relieving the acute suffering, starvation, and hardship in the liberated countries during what is expected to be the worst winter of modern times," said Dr

Sawyer

UN R.R.A.'s responsibility in the field of international health work includes control of epidemics, assistance to the liberated nations in reestablishing their own health services, and provision of needed medical supplies. Included in the 1,200,000 long tons of food, clothing, and other goods shipped by UN R.R.A to the liberated nations are 3,000 tons of medical supplies. Dr Sawyer stated that at least three times that amount has been scheduled for shipment during the remaining months of 1945.

### New Vitamin A Is Discovered after Three Years of Research

Discovery of a new vitamin A, described as a "twin" of the well-known vitamin A, which maintains luster in the human eye and helps fight infection, was announced on May 23 before the Rochester section of the American Chemical Society by James G Baxter and Charles D Robeson, research chemists of Distillation Products, Inc., of Rochester The new vitamin, called gadol to differentiate it

The new vitamin, called gadol to differentiate it from alpha gadol, the name for vitamin A, until a formal name is given it, is immediately important, Mr Baxter said, because it speeds the process of assaying vitamin A. Only further research can

determine its specialized uses

The new vitamin is found, like the original vitamin A and the varieties A-1 and A-2, in fish-liver oils and green plants. Vitamin A sometimes is called the antiverophthalmie vitamin because its presence in the diet prevents xerophthalmia, a dry condition of the eyes. The fish oils are presenbed generally for growing babies because in their pure state they also contain vitamin D, a rickets preventive.

To find whether vitamin A is present in fish or vegetable oil, Mr Baxter explained, two tests are given. One, called the optical method, measures within a few minutes the substance on a spectrometer. The other is a test of its biologic potency and involves feeding samples of the oil to laboratory animals, such as rats, for as long as three months.

The new vitamin A, Mr Baxter said, has substantially the same "extinction coefficient" as the

older vitamin A on the spectrometer

Quantities of the new vitamin, will be made available to other vitamin research laboratories. The isolation of the new vitamin took three years, Mr. Baxter said.

## Safeguards for Foreign Disease Adequate

Less evotic disease has been introduced into the United States by returning soldiers than medical officers anticipated, and, though safeguards now in effect should be continued, no new steps are necessary. This was the consensus of the Interservice Committee of the Army and Navy medical departments and Public Health Service, which met to discuss the subject on June 8. The Surgeon General was represented at this meeting by Lt Col Francis R. Dicuaide, Chief of the Tropical Disease Treatment Branch, Medical Consultants Division.

### Sulfa in Wounds Discontinued

The Army's accumulated experience in wound management does not justify the local use of any chemical agent in a wound as an antibacterial agent, according to the Office of the Surgeon General The local use of crystalline sulfonamides (sulfa powder) has therefore been discontinued except in the case of serious cavities, where its use, while permissible under the direction of the surgeon, is not recommended This subject is covered by War Department Circular No 160 as amended by W D Circular No 176, 1945

# New Drug Is Used to Treat Typhoid

Streptomycin, the germ-killing qualities of which nere revealed only a year ago, has been used successfully in the treatment of typhoid fever, a disease for which to date there has been no known positive cure, it was disclosed in a recent issue of the Journal of the American Medical Association

Of five persons treated who had been infected with typhoid through a germ carrier reportedly stemming from a bakery, three were completely cured, and in the 2 other cases the authors suggested that certain human body substances were present that inhibited the influence of the strepto-

These new experiments with streptomycin, which indicate its effectiveness in combating gram-negative bacteria, against which penicillin has been used without success, were conducted in December, 1944, by three Philadelphians Their studies are the first publicly reported successful experiments in

treating typhoid with streptomy cin
The scientists are Dr Hobart A Reimann, of the Jefferson Medical College and Hospital, directed the clinical studies, assisted by Dr Alison H Price, of the same institution, and Dr William F Elias, of the Wyeth Institute of Applied Biochemistry, who handled the laboratory tests

While purely in the experimental stage, streptomycin was nevertheless said to present the first good approach to a cure for typhoid, which scientists have sought for ages, but thus far they have developed only a conservative fever treatment

The experiments also indicated a probable superionty of streptomycin, originally discovered by Dr Selman A. Waksman, of Rutgers University, over penicillin in the long-range treatment of such diseases as tuberculosis. With few exceptions, penicillin has proved of little value in the treatment of these diseases

In the Philadelphia experiments, the 5 patients were treated over a period of one to two weeks each and received daily dosages of streptomycin

They were treated with streptomycin orally as well as intravenously and intramuscularly, the oral treatment alone was ineffective. The report sugtreatment alone was ineffective. The report suggested, however, that oral treatment with streptomycin in typhoid areas might prove useful in preventing the disease in the same manner that atabrine 18 successful in preventing malaria

Streptomycin is available in limited quantities and is provided for experimental uses only It was described by one scientist not connected with the Philadelphia experiments as in approximately the same stage of development for general public use as

penicilin was two years ago

The drug has been used successfully in the treatment of tuberculosis in guinea pigs in experiments at the Mayo Chinic by Drs W H Feldman and

H C Hinshaw

### Find Red Blood Cells Can Be Kept Longer in Corn Syrup Solution

A wider use in the transfusion of type-O blood cells, which are left after plasma is removed from whole blood, is now possible through the discovery that a 10 per cent solution of corn syrup in distilled water serves as a better medium for preservation of these cells than any other solutions so far tried, according to a report of two Red Cross doctors in the April 28 issue of the Journal of the American

Medical Association The physicians are William Thalhimer, MD, associate technical director, Blood Donor Service, American Red Cross, New York, and Maj Earl S Taylor, (MC), AUS, technical director, Blood Donor Service, American Red Cross

These red blood cells, which can be used in transfusions of the wounded in battle without the necessity of determining the patient's blood type, are obtamable in huge amounts by centrifuge in the preparation of blood plasma from the many hospital blood banks and the extensive American Red Cross blood procurement program for the armed forces While it is recognized that the transfusion of red blood cells serves as well as whole blood for many patients, the main problem has been, they say, "to find a solution for resuspension which will preserve the cells for a long enough time to make their use practical.

This report is based on 761 transfusions of centrifuged type-O cells resuspended and stored in 10 per cent corn syrup up to sixty days and administered to 437 patients, many of whom received repeated transfusions, some daily and some several times a

It was found that 10 per cent corn syrup in distilled water successfully preserved the cells for as long as sixty days Solutions of sodium chloride containing the proper percentage of salts to keep the red blood cells unaltered has been used extensively but is far from ideal, the authors say, "in that it is necessary to administer the saline-suspended cells not later than five days after the blood is obtained from the donor

"The clinical improvement has been what could be expected from the administration of the same amounts of whole blood of the same age, and the same increase in the patients' total red blood cell count and nonagglutinable (transfused type-O cells) Careful observation rered blood cells occurred vealed no unusual or deleterious effects, a low feverchill reaction rate, and the absence of hemoglobinemia, hemoglobinuria, or jaundice in any of the patients

# New Type of Operation Saves Lives of Three "Blue" Babies

A new type of operation, apparently the first of its kind in medical history, has saved the lives of three "blue" babies, according to a report in the May 19 issue of the Journal of the American Medical Associa-tion Heretofore, a "blue" baby with heart disease present at birth was considered beyond the reach of surgical aid

Alfred Blalock, M.D., professor and director of surgery, and Helen B Taussig, M.D., associate in pediatrics, both of Johns Hopkins Hospital, term the operations "sufficiently encouraging to warrant an

early report "

"During the past three months," the doctors wrote in the Journal, "we have operated on 3 and each appears to be greatly benechildren fited "

In "blue" babies, a malformed heart causes insufficient oxygen in the blood, resulting in a bluish color to the lips and skin This deficiency is due to the failure of the blood to obtain adequate oxygen as it flows through the lungs

The operations were undertaken, the two physicians said, "with the conviction that even though the structure of the heart was grossly abnormal, in

# CLAIMS

VS.

# DIFFERENCES

WHAT value have claims of superiority unless there is a difference in formula or process to justify such claims?

Take cigarettes for example

PHILIP MORRIS Cigarettes are <u>made</u> differently In the clinic as well as in the laboratory, the <u>advantages</u> of Philip Morris have been repeatedly observed, repeatedly reported by <u>recognized authorities</u> in leading medical journals Yes, Philip Morris claims superiority <u>and that superiority has been proved</u>.

May we suggest that your patients suffering from irritation of the nose and throat due to smoking change to Philip Morris—the one cigarette proved definitely less irritating

# PHILIP MORRIS

[Continued from page 1904]

many instances it might be possible to alter the course of the circulation in such a manner as to lessen the cyanosis and the resultant disability"

The operation is performed by entering the chest One of the pulmonary arteries is joined to a large artery leading away from the heart greater pressure in this blood vessel forces the blood to flow into the pulmonary artery and on through the lung In all 3 cases, the pulmonary artery was too small to allow adequate amounts of blood to get through to the lung Although the three opera-tions differed in some details, in each instance the surgery greatly increased the volume of blood which reached the lungs, and hence the amount of blood which received oxygen.

The doctors state that the operation is indicated only when there is chincal and x-ray evidence of a

decrease in the flow of blood to the lungs

The first operation was performed on a baby girl, who was too small and weak to permit laboratory studies She couldn't sit alone, she refused feedings, and she had lost weight After surgery, her improvement was regarded as "remarkable" by the doctors Her appetite improved, she gained weight, and is now learning to walk

The second patient, a 9-year-old girl, was so severely incapacitated that she could not walk 30 feet without panting. Two and a half weeks after the operation, she walked 60 feet, rested a short time, and walked another 60 feet back to her room

The third operation was performed on a 7-yearold boy Before surgery, his lips were a dark purple and the child was unable to take even a few steps "The day after the operation," the doctors said, "he lay in an oxygen tent with cherry-red lips When taken out of the tent his color remained good. His disposition changed from that of a miserable whining child to a happy smiling boy slow to permit him to walk because of a persistent low-grade fever, but at the end of the third post-operative week, he could walk 40 feet without panting He was then allowed to be up for several hours each day and has walked and played in his room '

### Leprosy Seen as Threat to G I 's Overseas

Five hundred to five thousand returning servicemen will develop leprosy during the next ten to thirty years, Dr Eugene R Kellersberger, general secretary of the American Mission to Lepers, estimated in May at a luncheon for members of the mission at the Gramercy Park Hotel, New York "A certain number of servicemen will come back with leprosy, but there is no sense being alarmist about it," he said "There won't be many"

After the luncheon, however, Dr Kellersberger, who was a medical missionary for twenty years and formerly director of a leper colony at Bibanga in the Belgian Congo, pointed out that the one leprosy center in the United States, at Carville, Louisiana, has a capacity of 500 patients there, he said At present there are 380

"There are 5,000,000 members of our troops working in tropical areas," Dr Kellersberger said, "and while leprosy is found all over the world it is most prevalent in tropical areas" He mentioned Africa, India, East Indies, the Philippines, and the southwest Pacific

The southwest Pacific, he said, "is the greatest area where leprosy is endemic and where men are exposed the longest, and it is found on every island in the southwest Pacific"

Leprosy is so conspicuous in the tropics, he explained, because of the great degree of poverty and poor living conditions in those areas, with their overerowded quarters, lack of sanitation, and ignorance Lake tuberculosis, leprosy is not an inherited disease and is most prevalent among children and adolescents between the ages of 5 to 15 years Education and improved living conditions are the main means of combating the disease, he said

However, leprosy is not confined to remote places Dr Kellersberger estimated that there are 3,000 to 5,000 cases of leprosy in the United States, with a concentration in big cities and in the South He said there are 48 cases in New York today, and

maybe even more

"We ought to disabuse the fantastic idea people have about leprosy," he said "We must educate them mostly about what it is not It is one of the least contagious diseases in the world and under proper conditions self-curing But we will never get rid of it," he added, "unless we put it out in the

open."

Under the national chairmanship of Luther H Hodges, vice-president of Marshall Field and Company, and the city-wide chairmanship of J Elmer Hahn, the American Mission to Lepers is engaged in a campaign to raise \$500,000 for a postwar antileprosy campaign It is hoped that New York will contribute one half of this nation-wide quota

## UNRRA Helps Check Malaria and Tuberculosis in Italy

Dr Dudley A Reckie, of Minneapolis, Minnesota, on leave from the United States Public Health Service to work with the United Nations Relief and Rehabilitation Administration, and now Commanding Medical Officer of the UNRRA Mission in Italy, reports that tuberculosis and malaria are being brought under control by projects carried forward in cooperation with the Italian government

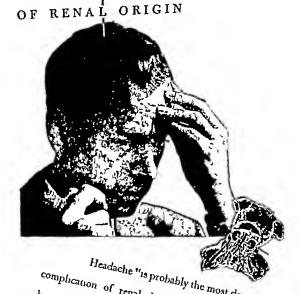

The effect of the war has been to increase sharply the incidence of both diseases. The flooding and mining of the Anopheles-breeding Pontine marshes by the Nazis during the occupation brought about renewed outbreaks of malaria, tuberculosis is being spread by returning Italian nationals who beeame infected in Germany A preliminary survey to discover the incidence of malaria in the Pontine area carried out this spring at Fondi in the province of Latinia showed that 100 per cent of the population living in that section were infected

Flooding and mining of the area is slowing down the work of malaria prevention. However, for the control of the adult malaria-carrying mosquito UNRRA has shipped 45,000 square feet of window screening, presently being distributed to the people Enough D D T oil solution to spray 1,200 houses in the most heavily mined or flooded UNRRA districts has been made available will also provide trucks, bicycles, and funds for the necessary labor of cleaning ditches and spraying

chemicals

The malaria control project is under the direction of Lt Col Vincent B Lamoures, an epidemic control engineer, who is chief consultant with the UN.R.R.A. staff in Italy Plans are now in progress. to send units of Italian engineers into other parts of the country to supervise malaria control work throughout the malaria season. This work is supplementary to the malaria programs of the Military Command and the Italian government.

HEAD'ACHE OF RENAL ORIGIN

Headache "is probably the most dramanc complication of renal disease" Associated with hypertension, it is "frequently intense, sharply local- $^{12}$ ed with definite onset and culmination, and strongly suggestive of localized cortical vascular spasm \*\*\*

McDonald, R. H., (Hendsches of senal origin); M Clin, N. Am. 21, 363 (March) 1940

Empirin' COMPOUND

BURROUCHS WELLCOME & CO (U & A) 17C f & 11 EAST SIST STREET, NEW YORK 17

### [Continued from page 1906]

The spread of tuberculosis has been aggravated by the thousands of Italian refugees returning to their homes, a very considerable portion of whom are known to be tubercular One of the major problems is to set up machinery for the diagnosis of individual cases, to isolate the patients, and to get effective treatment started before the advent of winter, which, because of threatened lack of food, fuel, and shelter, it is feared may be the most severe in modern history The Italian government became alarmed early in May when it learned that 75,000 refugees had escaped from German camps and were making the rough trek on foot through the snowy alps Many of these refugees were reported to be in a tubercular condition X-ray teams were rushed to Florence to begin examinations in the refugee camps established by the allied commission and the Italian government in Grossetto, Siena, Arezzo, the republic of San Marino, and at Varese near Lake Como at the Swiss border During the period of During the period of Nazi domination thousands of Italian workers in the German war plants were "repatriated" because they had developed tuberculosis Their presence has served to spread the disease among the civilian population.

A program of tuberculosis examinations for all university students in Rome and Naples has been arranged by the UNRRA Mission in Italy in conjunction with the Italian government and interested relief organizations. The universities will supply the machines, and UNRRA will provide the film and personnel to organize the work

Tuberculosis examinations are now a part of the health surveys at Fondi in Latinia by the Unitarian-Congregational Medical Nutrition Mission attached to U.N.R.R.A. For this purpose U.N.R.R.A has shipped photofluorograph equipment to Fondi and an excellent beginning is reported with 300 people being examined daily. One such survey near Rome in which 2,000 mothers and children were examined showed that the Italians were worse off than the United Nations nationals, x-rayed in the refugee camps. Results of the health surveys emphasize the importance and urgency of the child-feeding program, especially for tubercular and pretubercular children.

Col. Ernest L Stebbins, Health Commissioner for the City of New York, and Dr Elmer Severinghaus, professor of medicine at the University of Wisconsin, both staff members of the Unitarian-Congregational Medical Nutrition Mission, are in Italy on special leave to work with UNR.R A on this program

## Red Cross Announces Civilian Blood Donor Recruiting Program

American Red Cross chapters throughout the nation will be permitted to recruit blood donors for civilians under a program announced by National Chairman Basil O'Connor Under this project any Red Cross chapter may take part in the operation of a donor center for civilians sponsored by a recognized medical or health agency The blood collected and the blood derivatives produced will be made available without cost to physicians, hospitals, clinics, and patients

This civilian program is entirely separate from the Blood Donor Service operated by the American Red Cross for the armed forces, Mr O'Connor said, and chapters in the eleven metropolitan centers where the Red Cross is now recruiting donors for the Army and Navy will not participate in it. These are Los Angeles, San Francisco, Oakland, Portland, Oregon, San Diego, Chicago, New York, Brooklyn, Boston, Philadelphia, and Washington. The formal announcement of the new program stated in part "The need for provision of blood

The formal announcement of the new program stated in part "The need for provision of blood and such derivatives as blood plasma and immune (measles) globulin in amounts sufficient to meet civilian needs is very real and great. Their unique and vital place in medical practice, so strongly emphasized by the war, is becoming widely recognized by medical and health agencies throughout the country, and many of these agencies already have developed or are planning programs to insure the provision of blood and its derivatives to meet civilian needs. The American Red Cross is now preparing to help its chapters to assist in this essential service"

# Outpatient Treatment to Be Available to Veterans

Outpatient treatment of veterans with serviceconnected disabilities in thirty-one mental hygiene clinics and intensive treatment courses in nineteen neurosis centers connected with general medical and surgical hospitals were authorized on July 29 by Brig Gen Frank T Hines, then Administrator of Veterans' Affairs

Designed to provide facilities for treating the rapidly expanding numbers of veterans suffering from psychoneurosis, the clinics will make treatment readily available to veterans disabled in service who are in need of reorientation and will aid the veteran in returning to normal life and a gainful occupation

in the shortest time possible

Outpatient clinics will be located, General Hines said, at the following hospitals or regional offices Boston, Hartford, Connecticut, New Orleans, Cleveland, New York City, Pittsburgh, Providence, St Louis, Washington, DC, Louisville, Minneapolis, San Francisco, Atlanta, Cincinnati, Dearborn, Michigan, Indianapolis, Newark, New Jersey, Milwaukee, Denver, Jackson, Mississippi, Seattle, Huntington, West Virginia, Bay Pines, Florida, Columbia, South Carolina, Des Moines, Iowa, Omaha, Memphis, and Batavia, New York, though this clinic may be in either Syracuse or Buffalo

Neurosis centers will be located at Aspinwall (Pittsburgh), Atlanta, Batavia, Bay Pines, Brecksville (Cleveland), Bronx (New York City), Des Momes, Ft Howard, Maryland, Hines (Chicago), Huntington, Indianapolis, Jefferson Barracks (St Louis), Kecoughtan, Virginia, Portland, Oregon, Minneapolis, San Francisco, West Roxbury (Boston), and Wood (Milwaukee)

Each of the clinics and neurosis centers will be staffed by a charf asymptotic and acceptant prophla-

Each of the clinics and neurosis centers will be staffed by a chief psychiatrist and assistant psychiatrists, psychologists, and psychiatric social workers. The staffs will be trained in the newest dynamic methods of treatment, and will operate on the pattern set by the Los Angeles Mental Hygiene Clinic of the Veterans Administration, which is obtaining excellent results in this field of psychiatry

Each outpatient clinic will be fully equipped for diagnosis and treatment, with facilities on hand for

x-ray and clinical laboratory examination

The neurosis centers will be equipped for intensive therapy of the severe neuropsychiatric patient and will have available equipment for therapy embracing psychotherapy both for the individual and group and

narcoanalysis and hypnotism for the purpose of exploring the subconscious in the same manner used in Army and Army Air Forces hospitals abroad.

In both types of clinic, occupational therapy, psychotherapy, recreational therapy, and social services, all nimed at an early re-establishment of the veteran in his home community, will be provided An innovation in this form of treatment will be the operation of the clinics both during the day and evening

In addition to the full-time staff, outstanding psychiatrists in each locality are being sought on a fee basis to devote part of their time to the mental hygiene clinics and to serve as consultants clinics and neurosis centers will be placed in operation just as rapidly as qualified personnel can bo obtained Some psychiatrists and other personnel have been attending training courses in the Army's Mason General Hospital on Long Island, New York, and other personnel is being sought by the Veterans Administration through recruitment

The Veterans Administration, early in the war, foresaw the needs of the psychoneurotic veteran and several months ago sought contracts for the services of existing mental hygiene clinics, but has encountered some difficulty along this line, because of the shortage of trained personnel and the heavy civilian patient load on these clinics Contract clinics in Louisville, Kentucky, and Toledo, Ohio, are giving outpatient service to veterans. Four other contracts, two in New Jersey, one in San Francisco, and one in New York, involving fifteen clinics, are nearing completion

While staffs of all Veterans Administration hospitals are depleted as a result of war conditions, it is believed that establishment of the outpatient chines will materially reduce the load on existing neuropsychiatric hospitals, which with new construction will adequately serve to care for all psychotic veterans. Authorities have estimated that 10 per cent of all returning veterans will need some form of reorientation, but they believe the vast majority will work out their own problems as soon as they re-

turn to work in their own communities

## Dr Zentmayer Awarded Leslie Dana Medal

The Leslie Dana Gold Medal, awarded annually for outstanding achievements in the prevention of blindness and the conservation of vision, will be presented this year to Dr Wilham Zentmayer, of Philadelphia, it has been announced by the National Society for the Prevention of Blindness

Dr Zentmayer was selected for this honor by the St Louis Society for the Blind, through which the medal is offered by Mr Leshe Dana, of St Louis This highly prized token of recognition in the field of public health is given upon the recommendation of the Association for Research in Ophthalmology

Despite his 80 years, Dr Zentmayer is in active practice as an ophthalmologist. He is professor ementus of diseases of the eye, Graduate School of Medicine, University of Pennsylvania, and consulting surgeon to Wills (Eye) Hospital, St Mary's Hospital, and Glen Mills School, all in Philadelphia He received his M D degree from the University of Pennsylvania School of Medicine in 1886

Dr Zentmayer is a member of numerous medical, public health, and other scientific organizations He has served as president of the Amorican Ophthalmological Society, chairman of the Section on Ophthalmology, American Medical Association, chairman of the Section on Ophthalmology, College of Physicians of Philadelphia, editor of the Transactions of the College of Physicians of Philadelphia, associate editor, Archives of Ophthalmology, and chairman of the Section on Eye, Ear, Nose and Throat, Medical Society of the State of Pennsyl-

He is also a member of the Board of Directors of the National Society for the Prevention of Blind-

The conditions of the Leslie Dana Gold Medal award set forth that it is to be made for "long meritorious service in the conservation of vision in the prevention and cure of diseases dangerous to eyesight, research and instruction in ophthalmology and allied subjects, social service for the control of eye diseases, and special discoveries in the domain of general science or medicine of exceptional im-portance in conservation of vision"

### ANTIBLEEDING MATERIAL

A new antibleeding material which may be useful in shock, in hemophilia, and to stop bleeding during surgical operations is announced by Dr Alfred Lewin Copley, of the University of Virginia School of Medicine (Science, April 27)

Before it can be tried in patients with hemophilia, the hereditary bleeders' disease, "extensive studies will have to be conducted," Dr Copley states

In the test tube, a small amount of the material rapidly clots hemophilic blood. It also almost instently stops blocking forms.

stantly stops bleeding from cut surfaces, it was found during operations on animals

This antibleeding material was obtained from blood plasma and also from human placentas placenta, sometimes called the afterbirth, is the maternal organ from which the unborn child obtains its nourishment A single placenta yields a largo amount of the antibleeding substance The latter is called thromboplastin because it acts, along with

calcium, on the prothrombin of the blood to convert it into thrombin It is thrombin which converts fibringen into fibrin to form the clot when blood is

The possible antishock usefulness of the antibleeding material was discovered when it was used successfully to treat six dogs suffering from peptone shock. This suggests that it may be useful in treating anaphylactic shock, the kind that sometimes comes following injections of horse serum containing In this part of the study the thromboplastic substance was used in the form of a protein compound although a protein-free material was also obtained

Other scientists have previously reported extracts from human placentas with some dogree of antibleeding material, and a more active substance was also obtained from pig's lungs — Science News Letter, May 5, 1946

# SUGGESTIONS FOR CONTRIBUTORS TO THE NEW YORK STATE JOURNAL OF MEDICINE

The New York State Journal of Medicine asks its contributors to follow the suggestions listed below in the preparation of their articles. In this way they will greatly facilitate the expeditious publication of the Journal. These suggestions have been devised in order to save correspondence, avoid return of papers for changes, minimize the work of preparation for the printer, and save the high costs of corrections made on galley proof

Size of Articles —It is earnestly desired that scientific articles shall not exceed 6 Journal pages at the outside Longer articles tend to lower reader interest. An average of five or six seems to be the most desirable from this point of view. Calculation can readily be made by multiplying the number of double-spaced typewritten manuscript pages by the fraction two-fifths, e.g., twelve manuscript pages will make five Journal pages.

Manuscripts—Papers must be typewritten on one side only of white sheets consecutively numbered, and be double spaced with one-inch margins. They should be prepared with great care so as to be typographically correct. All headings, titles, subtitles, and subheadings should be typed flush with the left-hand margin. This is imperative for rapid

and accurate composition by the printers

Titles—The title should be brief and typed in capital letters. The subtitle can be longer and should be typed in caps and lower case letters. Under the title, or subtitle, if there is one, should appear the name of the author and city in which he lives. Directly under his name should be the hospital or institution with which he is affiliated.

Subheadings —Subheadings should be inserted by the author at appropriate intervals

References.—It is the unfailing practice of the New York State Journal of Medicine to use specific "references" rather than "bibliography" There should appear in the text reference numbers, typed above and to the right of the word to which there is a reference. A list, consecutively numbered, of these references should follow at the end of the manuscript. (Note that spelling in list is same as in text.) The arrangement should be as follows and should include all items.

a Books—author's surname followed by initials, title of book, edition, location and name of publisher, year of publication, volume, and page number Thus, Osler, W Modern Medicine, 3rd ed, Philadelphia, Lea & Febiger, 1927, vol 5, p 57

b Periodicals—author's surname followed by

initials, name of periodical, volume, page, month (day if necessary), year of publication Thus, Leahy, Leon J New York State J Med 40 347 (March 1) 1940

NOTE The JOURNAL does not include titles of nrticles

Case Reports —Instead of abstracts of hospital lustories, authors should write these reports in a narrative style with properly completed sentences All unimportant details should be deleted with such general negative statements as fit the case

Tables — While tables are very useful on lantern slides in the reading of papers, they fail of this purpose to a large extent in the printed page. For that reason it is urged that they be reduced as much as possible to descriptive language.

Illustrations —These should be kept to the minimum necessary to make clear the points to be registered by the author. In some instances they are imperative to proper understanding, in others they are merely picturesque. The latter can be excluded to good effect, both as to space

and the not inconsiderable cost

When illustrations are to be used they should accompany manuscripts and each should always be referred to in the text, preferably by number Drawings or graphs should not be larger than 12 × 16 inches, and must be made with jet black. India ink on white paper Do not use typewriter for lettering. The smallest lettering on 8 × 10 inche copy should be no less than ½ inch high. Cross section paper (white with black lines) may be used, but should not have more than 4 lines per inch. If finer ruled paper is used, the major division lines should be drawn in with black ink, omitting the finer divisions. In the case of finely ruled paper, only blue-lined paper can be accepted. Lettering and all markings must be large enough to be readable after reduction. Mail rolled or flat, never fold Photographs should be very distinct and show clear black and white contrasts. They must be on glossy white paper. Avoid round and oval photographs

Whenever possible "crop" photographs, 1e, mark portion that can be excluded when reproduced Crop marks should be on margin of photographs

Do not run pencil lines through photographs

It is important to mark the top of the illustration on the back, also its number as referred to in the text, thus, Fig 1, 2, and the name and address of the author

Legends should be typewritten on one sheet of paper and attached to the illustrations

appears after treatment has stopped

\* Nature 155 201 (1945)

carrier presents a more difficult problem the organisms are more deeply situated when the tonsil is involved, and the frequent swallowing of secretion prevents the long-continued action which can be secured by applying a powder to the nasal mucosa All that we know about the sulfonamide effect on bacteria points to the necessity for continuous and prolonged action, and the throat is one of the most unpromising areas in the whole body for securing Nevertheless, attempts have been made to eradicate hemolytic streptococci from the throat, or at least to prevent their access to it, by the use of sulfonamide lozenges, and opinion on the efficacy of this proceeding has been divided The sceptics will find strong support for their attitude in the observations reported by Vollum and Wilson in the opening paper of this issue Opportunities for a controlled trial of the method were presented by outbreaks of hemolytic streptococcal infection involving a large proportion of the population of two schools All the carriers having been identified, some of them were given lozenges containing sulfapyridine and sulfathiazole to suck, while the remainder were The treatment treated in other ways or not at all was continued for from five to seven days in two series with 6 and in one with 12 lozenges daily, containing one half grain of each drug Not only was there no effect on existing carriers, but 7 boys out of 24 so treated in order to prevent their acquiring the infection became carriers during the period of treat-Although the total numbers concerned are not large, this study was so carefully controlled in every way that its conclusions must be accepted. Sulfonamide lozenge therapy at least with these

drugs in the doses used is evidently useless

dose given was presumably too small to produce a systemic effect and a distinction should perhaps be

drawn between this proceeding and the administration in ordinary tablet form of 1 Gm or more daily

for prophylactic purposes Much evidence has now accumulated that this serves to prevent relapses in

rheumatic fever and recent observations on a very large scale in American naval personnel support the conclusion that doses of this order afford some pro-

easier to curb the more violent activities of the

hemolytic streptococcus than to prevent it altogether from establishing itself in the throat similar study to that now described by Vollum and Wilson but conducted with penicillin pastilles as recommended by MacGregor and Long 2 would be

of great interest Penicillin is a far more potent agent than sulfonamides, indeed according to

recent observations by the same authors 3 it exerts an astomshingly rapid bactericidal action in the

cillin pastille treatment will alleviate acute streptococcal throat infection and eliminate the organism

itself although in chronic tonsillar carriers it re-

use of these pastilles will succeed where sulfonamide lozenges have failed remains to be discovered

They obtained some evidence that pem-

tection against acute infections

It is perhaps

How far the

Sulfonamide snuffs, first employed by Delafield. Straker, and Topley, are of undoubted value in the treatment of nasal carrier states. The throat

### SOCIETY FOR PREVENTION OF BLINDNESS ISSUES ANNUAL REPORT

Steady progress in the organized campaign for protection of ovesight in America during the past three decades is reflected in the thirtieth annual report of the National Society for the Prevention of Blindness made public in April by Mrs Eleanor

Brown Merrill, executive director
Among the Society's principal notivities were the conservation of eyesuant in industry, control of plaucoma a disease which frequently leads to blundness, and promotion of special classes and facilities for the education of children with scrously

defective vision

The outstanding development in conservation of eyesight in industry, the report says is the Society's participation in the War Production Board's drive to speed up production through improvement of visual conditions in war industries. Cooperating in this program are the U.S. Public Health Service the War Manpower Commission and the US Department of Labor

A study of conditions in one hundred and fifty plants employing more than 400 000 workers, disclosed the following facts only 61 per cent make the proplacement vision tests necessary for correct job assignment, more than 75 per cent of the plants where tests are made fail to liave the testing done under the direction of an eye specialist more than 85 per cent of the plants fail to recleck vision of all employees periodically more than 80 per cent make no recheek of vision of workers exposed to special hazards. 92 per cent fail to recheck vision of cm

ployees with poor production records 83 per cent do not recheck vision of workers involved in accudents and 73 per cent make no rechecks where the original vision test disclosed need of follow-up

Discussing vocational robabilitation, the report asks "If it is possible in time to utilizes of war, defective eyesight with the aid of corrective work goggles proper lighting, and other mechanical improvements why could not these principles be applied to the postwar program of providing useful work for the returning visually handicapped serviceman as well as for civilians who hitherto had not been able to realise fully their capacity for gainful employment?"

In a preface entitled "Looking Ahead," Mason H Bigolow, president, says "Since the founding of the Society thirty) cars ago the number of children in schools for the blind who lost their sight because of ophthalma nematorum has been reduced by 75 per cent, the number of sight-saving classes for school children with seriously defective vision has grown to 618, and programs in industrial safety lave multiplied and improved notably "

As part of its program of public health education during 1944 the Society sponsored three hundred and fifty broadcasts by radio stations throughout the country produced a documentary film "Eyes for Tomorrow" which was shown approximately sur hundred times in more than twenty states, distributed more than a quarter of a million pamphlets, and utilized various other channels for reaching the public, such as newspapers, magazines, and meetioes.

# YOU CAN'T OVERRATE THE VALUE OF

# CONTROL

In olmost every field of endeavor there is striking illustration that contral is a prime factor in perfection of performance

Operating on this principle, the modernly equipped U D loboratories evidence unusual quality control in the development and production of fine pharmaceuticals. Extraordinary precoutians insure the purity and potency of every preparation bearing the esteemed U D label For example, a special group of doctors, chemists and pharmacists—the Formula Control Committee—nat anly double checks each new recipe but the Control Loboratory also tests tharoughly each botch of every finished product

As a result, you can be certain af products unexcelled in quality whenever you specify U D pharmoceuticals. A comparable high quality af service is conveniently available to you and your patients at your neighbarhood Rexall Drug Store—characterized by dependability and economy

FURETEST PLENAMINS Complete vitamin dietary supplement in capsule form. Vitrushins A, D B<sub>2</sub>, C, E, O (B<sub>2</sub>) B<sub>4</sub>, Niactionalide Calcium Pantothenate with Liver Concentrate and Iron Sulfate AVAILABLE AT ALL REVALL DRUG STORES

HISTORY OF MEDICINE

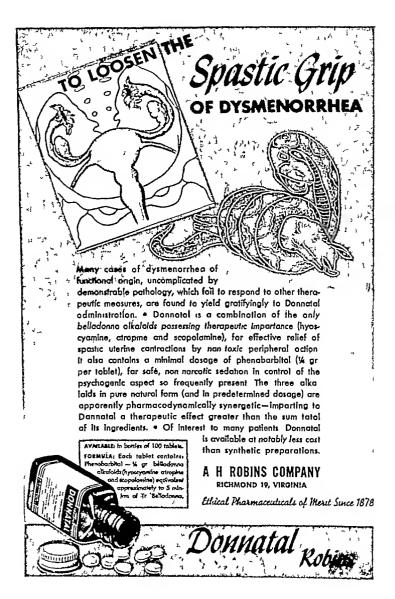

T Wood Clarke, Chairman Judson B Gilbert, Vice-Chairman Claude E Heaton, Secretary

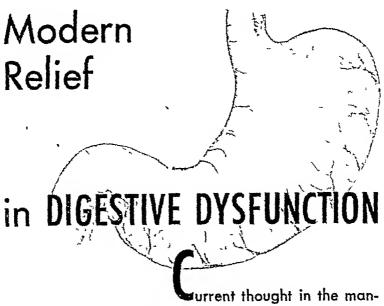

Utica Schenectady New York

PHYSICAL MEDICINE

Walter S McClellan, Chairman Sara Albert Richard Hatfield, Jr, Secretary Saratoga Springs Utica

agement of gastrointestinal disease leans progressively toward conservative treatment.

Favorable clinical results have led to a growing tendency to employ medical rather than surgical means in the treatment of peptic ulcer. Along with this there has been a liberalization of the dietary regimen.

Urgency for early treatment of gastritis lies in the threat of progression to ulcer and malignancy.

The value of antacids and adsorbents in these conditions is widely recognized, and among those Bismuth and Kaolin as exhibited in Bismakaolin are being increasingly and gratifyingly employed

For your cases of digestive disorders, specify

Estrogenic Substance-Breon has helped grant woman the right to enjoy her forties. She turns with confidence to her physician for relief when vasomotor and psychoneurotic symptoms predominate. The administration of Estrogenic Substance-Breon makes the task easier for the doctor and for the patient, too

This ovarian follicular hormone preparation, standardized in terms of total estrogenic potency, is assayed by the vaginal smear method, is of proved uniform purity as determined by melting point, optical rotation, and bioassay Each 1000 I U of Estrogenic Substance-Breon produces the equivalent in estrogenic effect of 0.1 mg estrone

Breon also makes Diethylstilbestrol, a synthetic estrogen effective by mouth.

George A. Breon & Company

therapy which provides the high safety and potency of naturally-occurring estrogens at low cost.

\*Trademark Reg U S Pat. Off

In utilizing the synergistic actions of Calpirate, ephedrine and phenobarbital—EPURAL becomes a potent bronchodilator and sodative, significantly free from untoward central and cardiac side-effects.

For symptomatic treatment of bronchial asthms, hay fever and allergic coryza, EPURAL offers the therapeutic advantage of providing prolonged bronchodulatation, and effecting safe sedation, which serves to counteract the natural tendency of ephedrine (when used alone) to stimulate the central nervous system

While EPURAL may be safely administered over protracted periods, with freedom from gastric disturbances, it should be used with caution in hyperthyroidism, diabetes mellitus, and severe cardio-renal disease.

FORMULA: Calpurate (calcium theobromine—calcium gluconate)

Ephedrine sulfate

Phenobarbital

# Orthopedic Support FOR Chronic

Low Back Pain

This lumbosacral support is specifically designed to limit the range of the lumbar spine hending when either the framework or soft tissues of the low back are the seat of injury or disease. Effective support is given the gluteal region, the lumbar spine and the sacro-iliac and lumbo-sacral joints. The adjustment about the pelvic girdle prevents undue pressure of the upper adjustments and yet the presence of the center adjustment gives relief and comfort to the patient. Provision is made for reinforcement with aluminum uprights when indicated.

### · A PRIMARY NEED IN ANTARTHRITIC THERAPY

Recognition of the systemic nature of chronic arthritis and the multi phasic involvement it engenders has led to the present method of treating the arthritic patient as a whole, not merely the involved joints.

A complete therapeutic program is needed—one which includes optimal nutrition orthopedic measures, elimination of foci of infection, physical therapy rost, supervised exer clse and correction of disturbed physiologic functions

Darthronol has proved an importantiategral part of such a the rapeutic program. By the pharmacodynamic and nutritional actions of its inlae constituents, it not only exerts a beneficial influence on the disturbed locomotor structures but in addition proves of value in the elimination of many systemic disturbances en countered in the arthritic syndrome. Comprehensive literature no request.

J B ROERIG & COMPANY 536 Lake Shere Drive, Chicago 11, III

# DARTHRONOL for the Arthritic a ROERIG Preparation

Originally Introduced as DARTHRON

# Estiving HAY FEVER RELIEF

Itching, burning cyes, excessive lacrimation, exhausting attacks of sneezing and profuse nasal discharge caused by various pollens are speedily and completely relieved with Estivin

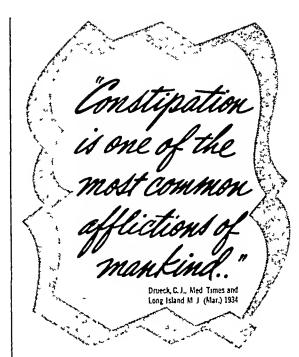

A drop of Estivin in each eye two or three times daily is generally sufficient to keep the average patient comfortable during the entire season In more severe cases additional application whenever the symptoms recur will assure freedom from distress throughout the day

CAUTION. Use Arlcaps only as directed

THE ARLINGTON CHEMICAL COMPANY,

Unsettled times like these bring the overburdened physician more than the normal number of patients suffering from chronic disorders of a cardiac, vascular or rheumatic nature

Here at the Spa, in superb plant facilities placed in a restful setting of great natural beauty, your patient will find the restorative care he needs to prepare him for the full benefit of your continued medical direction

Under regimens of treatment which

you yourself recommend, your patient, relaxed in mind and body, draws a full measure of improved health from the Spa's naturally carbonated mineral waters

Well trained physicians are available in Saratoga Springs for consultation with your patient on the details of the program

Secure in the knowledge that your instructions for his care will be faithfully carried out, you find needed relief from your overburdened practice

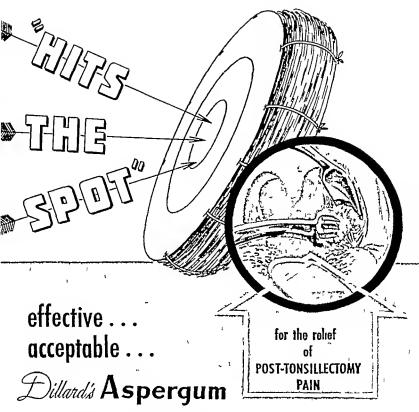

### "PHYSICIAN, GIVE HEED TO THINE OWN HEALTH"

Many physicians have recently come to the Spa for the same kind of treatments that helped their patients here After a restorative "cure" at the Spa, you, too, would return to your practice refreshed—revitalized—ready for the busy days that still he ahead

### THE EMPIRE STATE'S CONTRIBUTION TO THE MEDICAL PROFESSION

For professional publications of the Spa, and physician's sample carton of the bottled waters, with their analyses, please write W S. McClellan. M D, Medical Director, Saratoga Spa, 155 Saratoga Springs, N Y

• Seldom are therapeutic effectiveness and acceptability to the patient so favorably joined as when Aspergum is employed for the relief of sore, irritated throat—following tonsillectomy • Chewing Aspergum, the patient releases a soothing flow of saliva laden with acetylsalicylic acid—bringing the analgesic into prolonged contact with pharyngeal areas which often are not reached, oven intermittently, by gargling or irrigations • Gentle stimulation of muscular action helps relieve local spasticity and stiffness. • With throat soreness and irritation relieved, the patient is more comfortable, partakes of an adequate dict earlier, enjoys a more rapid convalescence.

Dillard's Aspergum is available in packages of 16; moisture proof bottles of 36 and 250 tablets

Ethically promoted—not advertised to the laity White Laboratories,
 Inc., Pharmacoutical Manufacturers, Nowark 2, N. J.

## WHAT MANNER OF

# Candies

## DOES AMERICA EAT?

MIDAFTERNOON His face beaming, a precious penny clutched in his fist, a little boy runs to the corner store Candyl He is going to buy candyl All the world has never looked so bright

But a penny has such little value today—what manner of candy can it buy? Yet the little boy finds it hard to make his choice Among others, there are peanut squares and malted milk balls, chocolate fudge and wrapped caramels, and peanut butter roll

Nutritionwise, what does his penny buy the little chap? He does not realize it, but in such candies there are 52 calories, and there is good protein (0.9 Gm.), fat (1.74 Gm.), and carbohydrate (8.33 Gm.), calcium (10 mg.), phos phorus (20 mg.), and iron (0.20 mg.), thiamine (0.01 mg.), riboflavin (0.01 mg.), and niacin (0.40 mg.)\*

In quantity, of course there is not much of each of these nutrients But then, a penny is not much either And besides, is there aught else in the world of which a penny would buy so much?

Nutritionwise, to use the term again, this typifies the quality America finds in such candies And it is made in gleaming, spotless kitchens, of chocolate, sugar and milk, butter and fruit, and eggs and nutmeats, under rigid laboratory controls

There is no sacrifice of quality or nutrient composition, even where a penny must suffice to bring the joy of candy into little lives

\*Average of a penny s worth of the five kinds of candy listed

## THE NUTRITIONAL PLATFORM OF CANDY

- Candies in general supply high caloric value in small bulk
- 2 Sugar supplied by candy requires little di gestive effort to yield available energy
- 3 Those candies, in the manufacture of which milk, butter, eggs, fruits, nuts or peanuts are used, to this extent also
  - a) provide biologically adequate proteins and fats rich in the unsaturated fatty
  - b) present appreciable amounts of the important minerals calcium, phosphorus, and iron.
  - c) contribute the niacin, and the small amounts of thinmine and riboflavin, contained in these ingredients
- 4 Candies are of high satisty value, eaten after meals, they contribute to the sense of satisfaction and well being a meal should bring, eaten in moderation between meals, they stave off hunger
- 5 Candy is more than a mere source of nutri ment—it is a morale builder, a contribution to the joy of living
- 6 Candy is nnique among all foods in that it shows relatively less tendency to undergo spoilage, chemical or bacterial.

#### THE IMPACT OF SURGERY ON THE LIVER

In biliary tract surgery, postoperative depression of hepatic function frequently constitutes a problem which demands the surgeon's prompt attention. Anesthesia itself imposes a burden on the liver Surgical manipulation, such as the opening and closing of the abdomen, the cooling off of the exposed viscera, the unavoidable traction on the gastrobe-patic ligament, all exert an unfavorable influence on liver function and bile flow

Decholin (chemically pure dehydrocholic acid) and Decholin sodrum, administered before and after biliary tract surgery, are effective means of mitigating and overcoming this untoward effect of surgery By inducing powerful hydrocholeresis they promote physiologic drainage of the hepatobiliary pathways and thus are a valuable aid toward lessening postoperative discomfort. Decholin is contraindicated only in patients with complete obstruction of the common or the hepatic bile ducts.

**SUPPLIED** 

Decholin in 33i grs. tablets. Boxes of 25 100 500 and 1000; and Decholin sodium in ampuls (3 5, 10 ec)

Riedel - de Haen, Inc . New York 13, N. Y.

uccessful management of high blood pressure calls for a regimen which is adjusted to individual requirements. Physical activity is generally curtailed and overwork is avoided. In certain circumstances special diets are prescribed and the use of stimulants is restricted.

These measures are often supplemented with the administration of Theominal This combined vasodilator and sedative aids in reducing blood pressure to a more normal level. As a consequence hypertensive symptoms are relieved and the risk of complications is reduced.

DOSAGE. The customary dose of Theominal is 1 tablet two or three times daily, when improvement sets in the dose may be reduced. Each tablet contains theobromine 5 grains and Luminal\* ½ grain.

\*Luminal (trademark), Winthrop Chemical Company, Inc. brand of phenobarbital.

Supplied in bottles of 25, 100 and 500 tablets.

Mont may be diabetic

A REVIEW of the records of over 45,000 selectees by Blotner and Hyde\* reveals an incidence of diabetes among young adults much greater than earlier studies have indicated. In the eighteen to twenty-five-year age group, the number of cases was found to be three to four times as high as shown in the National Health Survey. In men of twenty-five to forty-five years, diabetes occurred four to five times as often as in the previous estimate. Another striking fact—78 percent of the cases thus discovered were not aware of ever having had diabetes!

While the question of the actual incidence of diabetes cannot be answered with accuracy, physicians are alert to the unmistakable upward trend A routine qualitative urine-sugar test on every patient is becoming an increasingly important procedure. Only through unrelaxed vigilance may early and adequate treatment be made available to the patient before important complications develop.

#### Neostigmine Therapy

Known for a number of years as beneficial in the treatment of myasthemia gravis because of its apparent effect in increasing conduction at myoneural junctions, neostignine (prostignine) is now being studied in relation to a wide varioty of diseases in which muscular paralysis, spasm, tension, or cramps are clinical symptoms

Neostigmine is one of a series of drugs which specifically inhibit the enzyme cholinesterase The function of cholinesterase is to split acetylcholine and thereby inactivate it Neostigmine, by inhibiting cholinesterase. allows the accumulation of acetylcholine at nervo endings and in that way produces profound functional changes in many different parts of the body Acetylcholine is recognized as an extremely important physiologic substance because it is responsible for transmission of nervo impulses to smooth muscles and glands in the parasympathetic nervous system, it is responsible for transmission of excitation from nerves to skeletal muscles. and plays a role of importance in transmission of excitation from nerve cell to nerve cell across the synapse.

In 1943, Kabat and Knapp<sup>1</sup> introduced neostigmine in the treatment of poliomyeli-They demonstrated that this drug deereases muscle spasm (muscular hypertonus and proprioceptive reflex hyperirntability) and inhibits incoordination in polion velitis In some instances striking improvement in strength of voluntary motion was observed. They showed that therapy with neostigmino brought about acceleration of recovery in subacute and chronic cases of poliomychtis The therapeutic effect of neestigmine in infantile paralysis was not nullified by atropine, and the improvement was usually retained after treatment was discontinued These observations have since been confirmed 2

The J.A.M.A 2 says editorially

"Trommer and Cohen" also noted good effect in the treatment of muscular spasm in patients with rheumatoid arthritis and some associated conditions Kabati has also indicated that this drug may have a useful function in treating hemiplegia, facial paralysis, cerebral palsy, chronic rheumatoid arthritis, and subacromial bursitis Over 50 patients with these various disorders were treated by subcutaneous injections of 1 mg of neostigmine methylsulfate with 0 65 mg or 0 43 mg of atropine sulfate

"In the series treated by Kabat there were 8 patients suffering from persistent joint stiffness, pain, and limitation of motion following various types of fractures In 7 of these cases significant improvement was noted during one to two weeks Seven patients with hemiplegia were observed with a favorable relief of their spasticity while under treatment Similar results were reported in patients with hemiplegia due to cerebral palsy of the congenital type Six patients with chronic rheumatoid arthritis were relieved in various degrees and, in general, Kabat felt that the results were encouraging enough to warrant further investigation with control procedures and other means of evaluation

"Schaubel<sup>5</sup> also has observed encouraging results with a similar form of treatment in cases of spastic cerebral paralysis"

While it is pointed out that the work pre-

sented by Kabat and others on the use of neostigmine in a large number of unrelated conditions is insufficient for critical evaluation, it appears to be as hopeful at least as any other line of investigation In poliomyelitis Brainerd, Katz, Rowe, and Geiger<sup>3</sup> conclude that

"Neostigmine inethylsulfate will relax the muscle spasm of poliomyelitis at least temporar-

"The value of continued medication with neostigmine, orally or subcutaneously, requires further proof, but its further trial under controlled circumstances is definitely warranted

"The Kenny treatment with or without neostigmine is an effective method of preventing contracture and deformity

"Our study gave no proof nor disproof that either neostigmine or Kenny packs reduce the incidence of paralysis"

<sup>1</sup> Kabat Herman M Ann District of Columbia 14 (June) 1945 <sup>2</sup> 128 812 (July 14) 1945 <sup>3</sup> Trommer, P R, and Cohen, Abraham J A M.A 124 1237 (April 29) 1944 <sup>4</sup> Kabat, Herman Pub Health Rep 59 1635 (Dec. 22)

#### Common Sense in Veterans' Medical Care

In a thoughtful letter to the New York Times the president of the Monmouth County (New Jersey) Medical Society discusses what appear to be sound and commonsense plans for providing local medical service for returning veterans in that area

In view of the fact that in the State of New York there became operative on April 11, 1945, Chapter 763, of the Laws of New York, creating in the executive department a division of veterans' affairs providing for "local participation in the maintenance and operation of veterans' service agencies," consideration of Monmouth County's plan for possible adoption by county units in this State in cooperation with the Veterans' Administration might be wise

"The Monmouth County plan is, briefly, as follows All members of the Monmouth County Medical Society who are willing to serve will be designated as outpatient physicians on a fee

1 July 8, 1945

basis for the Veterans Administration—this will be approximately 90 per cent of our membership The society will supervise the work to make sure that the veterans are given proper care addition, at convenient places in the county, at such intervals as the volume of work requires, These will be there will be screening clinics staffed by specialists in several fields-internal medicine, general surgery, orthopedic surgery, eye, ear, nose, and throat, psychiatry, etc these clinics the returning veteran may come, having authorized the Red Cross to obtain his On the basis of this rec-Army medical record ord and their own findings the clinic staff will determine whether the veteran needs treatment and whether such treatment can be carried out at home or requires hospitalization

"If he can be treated on an outpatient basis, he will be shown a list of physicians qualified to treat his particular condition, from which he makes his choice If he has no choice, he will be assigned to a physician convenient to his home The Veterans Administration will provide the necessary clerical work and will also provide a

liaison officer to authorize the referral

"Plans are also being made to permit hospitalization of the veterans in local general or specialized hospitals. It should be attact that this had already been proposed by the Veterans Administration before the medical society auggested it

"The Monmouth County plan preserves the individual doctor-patient relationship and avoids the psychologically had situation of being treated by a government doctor in whose selection the patient has no part. It also will obviate the hardship of traveling long distances to a veterins' chinical center

It is based on the principle that before he was a soldier a man was a citizen and that as a veteran he has certainly lost none of the

rights of a citizen Our Monmouth County plan, it seems to us, preserves intact one of those rights, and if it adds something to the medical service rendered to the nonveteran citizen, it is little enough for us to do for those who have fought our wars for us "

Such seemingly practical plans as these based on sound principles and local participation in veterans' medical care are steps in the right direction. If they are set up and implemented now much valuable time will be saved and the doctor-patient relationship preserved as far as this is possible. We recommend its consideration by the county medical societies of this State.

#### More of the Same Needed

In its issue of July 21, 1945, the Saturday Evening Post' carries a discussion of the Wagner-Murray-Dingell bill by Dr. Mary B Spahr. It is to be hoped that many physicians will read it, certainly it will be read by millions of lay people who are interested, or should be, since it is their money which the authors of the bill propose to disburse so layishly. Dr. Spahr says

"Discussion of the Murray-Wagner-Dingell bill onght to clarify the issues raised by 'socialned medicine.' Instead, they are fogged up in a haze of prejudice and special pleading

"As a physician, I point without pride to the record of my own profession in defending its position. We doctors eschew calm analysis and content ourselves with angry mutterings about 'political medleine,' so that the uncritical observer accuses us of putting our professional hablts above our aspiration that all the people shall have good medical care and have it more We assume that all advocates of abundantly socialized medicine are accusing us doctors of giving the best of care only to our best-paying patients. The friends of the Wigner bill are too often able to put doctors in the position of regarding medical progress as the monopoly of private practitioners

"We doctors naturally resent being denounced as mercenary and uncharitable by ndvocates of a bill which does not compel protection of the indigent So, in our wrath, we find to admit that many medical advances have been made under Government auspices—quarantine, heensing of ndvarelans, and public-health education, among others We give eards and spades to our opponents by stubbornly refusing to admit that the Government-paid doctor has a vital place in our economy

"So few of the disputants have actually read the Wagner bill that misunderstandings further confuse the issues and adetract the question, which is Will the Wagner bill realize our common ideal of good medical care for everybody? Further, can any national plan be launched successfully during the present shortage of physicians?"

Dr Spahr writes extensively of her E M I C insurance, and private practice of pediatrics in a town of 20,000 writhout geographic or social limitations. She notes the drawbacks even to a personalized insurance plan which she devised. She says further,

"My experience is not unique. Several years ngo, a county medical society launched n medical-insurance plan. During the first year the cost of providing the services agreed on was nearly three times the income from policy holders. There had been no unusual epidemic or catastrophe, and no more than the expected number of operations. The deficit was due entirely to the large number of house calls for minor illnesses. The provisions of the standard policy have been sharply revised. It now covers surgical costs alone. If a medical nder is added, the premium is all but tripled.

"The Wagner plan overlooks the pertinent experience of voluntary insurance when it envisages complete medical insurance at a cost approximating the present total national medical bill it provides neither for mounting costs nor for the multiplication of physicians to meet the souring

demands, although it is common knowledge that there is already a shortage of physicians. Somehow the demand must be reduced to conform to the supply of medical facilities and of funds

"Medical services cannot be standardized by rule Not only are patients diverse in their demands, but ailments cannot be graded and catalogued 'Chickenpox, one house call, sprained ankle, three office calls, pneumonia, seven hospital calls,' and so on "

She writes in plain terms of the relief programs in her area and the inevitable bureaucratic red tape

"Thwarted as I felt by the bureaucrats and red tape that had come between me and my patient's need, I have no panacea to suggest as an alternative to these regulations. They seem to go with public medicine. Sometimes it was only delay that thwarted our best efforts for the well-being of our patients. On other occasions, no word of the patient's condition reached our ears. It rankled when nonmedical persons passed on what treatment a patient 'deserved,' rather than what he needed, using moral judgment as the basis of selecting cases for treatment.

"This experience with relief medicine is overlooked by the framers of the Wagner bill Most people assume that the bill makes generous provision for the indigent Careful perusal reveals exception after exception which relieves the Federal insurance funds of the most expensive cases. For example, the bill does not cover tuberculosis, mental disease, or the infirmities of old age. It does not even cover the indigent Carefully studied, the Wagner bill is found to be limited to the protection of medium-sized incomes from middle-sized diseases.

"Private insurance and public management alike find the costs of small illnesses most difficult to control. The Wagner bill sets forth just one provision against the increase of minor complaints. To prevent abuses, each individual may be required to pay the cost of the first service in a 'spell of sickness'. Any physician who has worked under voluntary medical insurance is sure this clause will have to be invoked, and that it will increase 'two-call illnesses'—the second call to give the patient something for his money."

Discussing the inevitable difficulties of administration, Dr Spahr states,

"On the side of administration, a compulsory plan presents obstacles which have never handicapped voluntary insurance. The patient who chisels more than his share of service cannot be excluded from future benefits, a doctor who evades his share of the drudgery can remain in Federal practice There is no certainty that a sufficient number of doctors now practicing will go into a Federal scheme As for doctors now in military service, their stake in the future of medical practice is rudely ignored, and their opinion is not even sought

"I may be wrong The Government may offer such dazzling salaries that enough doctors can be attracted into Federal medicine to give it a trial run. If so, their standards of practice will be controlled by Federal officials as they never were by the relief agencies. Few doctors were dependent on relief clients for the major part of income, few of us needed to cater to the relief workers. And we had some spare time to make disallowed calls on relief clients. Under a universal compulsory system these freedoms would certainly be restricted.

"We Americans have had privacy for so long that we forget the value of the freedom from intrusion guaranteed in our Bill of Rights Whether or not Federal medicine sends its workers into our homes to investigate our need for medical care or to urge us to follow medical advice, we shall lose our privacy

"Insurance is essentially for calamities, in every field, it is provision for the small losses that is difficult. Yet it is the cost of serious illness that worries the patients. It is the usual experence of physicians that anyone with a regular job takes the cost of brief sicknesses in his stride.

"There are not enough doctors for universal medical insurance All Government plans demand from the doctor responsibility without allowing him authority to exercise that responsibility

The Wagner bill gives no assurance that patients are to deal directly with their doctors Overworked doctors nowadays have a hard enough time deciding which of their incoming calls are the most urgent If the calls are to be shunted through a Government worker, we should start with two strikes against us-and against the patient's recovery Federal subsidies for medical facilities in underprivileged areas and for calamitous illnesses are at least as feasible as Government payments to returned veterans for their education in privately managed colleges Some plan by which the Government contributes to medical care without dominating it has yet to No such plan is possible without be charted the active cooperation and support of doctors We of the medical profession must take an even more active part than we have taken in adapting our skills to changing conditions

"No matter what the plan, dreamers of dreams of Federal medicine must put them aside until there are enough physicians to carry out

what the Wagner hill undertakes to guarantee to the people."

This is plain speaking, devoid of technicalities, readable, and convincing It comes at a timo which has just seen a coalition government in England overthrown by the Labor Party in an election which at the same time repudiated Sir William Beveridge, though not necessarily his plan for security from the oradle to the grave. The Wagner-Murray-Dingell hill in this country is said to have the backing of organized labor If so, recent trends ahroad may provoke a rash of

such ill-considered legislation as that which Dr Spahr discusses

It would be well if the medical profession would more freely discuss in lay periodicals its scientific experience with government medicine both here and abroad, its good points as well as its operation against the public interest It is to the good, reliable common sense of the public that our arguments must be presented In this instance Dr Spahr and the Saturday Evening Post have done a timely and noteworthy service both to the medical profession and in the public interest More of the same is needed

#### Of This and That

Silver Lining It is hard to find these days the alver lining that lies on the other side of the war cloud, but in looking over the domestic situation it occurs to us that the Federal Government, with all its blundering. may be benefiting a large number of sufferers from various human ailments. The high red-point value and the scarcity of fats must certainly be looked upon as a boon to those suffering from gallbladder diseases who lack the self-control to ration themselves with respect to gravies, fried foods, and fat Then, too, the scarcity of steaks meats and chops prevents those with high blood pressure from running it up still higher, and the prevalence of ground-up meats is surely a boon to those with false teeth cut in the sugar ration will help the diahetics. whether they like it or not, and will also materially assist others who are overweight but who lack the strength of character to deny themselves the luxury of overindulgence in carbohydrates

We do not necessarily advocate substitution of government controls for strength of character, self-denial, and abstinence on a voluntary basis, but we are willing to concede that the shortages and the pointrationing system have their brighter sides We consider the matter of the cigarette shortage to be one too controversial for

extended comment at this time

Citizen Participation in Public Health. Representatives of twenty states, including New York, were present at a Public Health Service course, March 26-30, at the National Institute of Health, Bethesda, Maryland The course was organized by the General Federation of Women's Groups and was conducted by the United States Public Health Service, according to Public Health News ! The purpose of the project, it is said, was the stimulation of citizen participation in public health on national, state, and local levels

Over half a million women pledged themselves, through their delegates, to conduct active programs in their own states among clubwomen and the women of other interested organizations The principal objectives were (1) survey of public-health facilities and activities, (2) evaluation of community public-health needs, and (3) interpretation of public-health programs

"The closing address, Today and Tomorrow in Public Health,' by Surgeon General Thomas Parran, embodied an analysis of the publichealth problem, a statement of national publichealth objectives, an interpretation of world cooperation in health, and a charge to the women of the country to participate in publichealth programs Excerpts from Dr Parran's address follow

"We in the United States have accomplished

Vol. 22 No. 16, April 16, 1915.

The appendix was removed in 36 cases (28 per cent) in this series. We do not recommend concomitant elective operations with patients in shock, hemorrhage, or suspected infections. Blood in the peritoneal cavity acts as a good culture medium for Bacillus coli. We can reasonably attribute two surgical deaths in this series to removal of the appendix with subsequent peritonitis.

However, these mortalities occurred prior to the use of the sulfa drugs, the use of which might have changed the ultimate results in these two Wherever possible, conservatism instances should be practiced in operating upon patients with tubal rupture or abortion Abdominal elective operations may be recommended in unruptured tubal pregnancy It is good surgical practice to inspect the other tube, for occasionally a simultaneous tubal pregnancy may occur in that tube, as happened in 1 case in this General anesthesia is the anesthetic of choice, spinal anesthesia is recommended only for patients operated upon before rupture occurs and in those cases having arterial pressure appropriate for this type of anesthesia cases (64 per cent) in this series, gas, oxygen, and ether were the anesthetics used, in 42 cases (33 per cent) spinal, in 2, cyclopropane, and in 1, local novocame infiltration

Transfusions - Experience over a period of years has taught us that exsanguinated patients are bad risks whether operated upon or not With severe hemorrhage, there is no marked transition between the state of peritoneal shock and the picture of internal continuous hemorrhage If allowed to continue, a state of irreversible shock occurs It is our opinion that a large number of patients can be saved if a prompt and massive transfusion of blood plasma or whole blood were available for them Of course, the time to transfuse must be dependent upon the patient's condition In its use, one should not wait too long in the hope that the gravity of the condition is due entirely to shock, instead, a massive transfusion should be given and the patient operated upon immediately because the condition will not improve until the bleeding vessels are ligated Plasma should be used prior to operation until blood is obtained In this series 41 patients (32 per cent) were transfused, the average blood transfused was 500 cc, the largest amount was 1,500 cc Autohemoclysis was done in 2 cases early in this series With plasma and/or blood now available at most hospitals, this procedure is now not necessary

Mortality—There were five deaths (39 per cent) in this series, one having died prior to operation with a surgical mortality of 31 per cent. There were no deaths in this series since 1936

#### Case Reports

Case 1—(18611) The patient was a white femily, age 33, with a history of pain in the precordial regard and abdomen and vaginal bleeding for four days price to admission. On the day of admission she had served abdominal pain and fainted. Menses occurring every twenty-eight days on the fourteenth, lasted four days. The last menses occurred November 16, 1930, and she was admitted January 2, 1931. Show as a widow, had no abortions, miscarriages, or full term pregnancies, but had an ectopic pregnancy two years prior to admission. She had had rheumstic heart disease and ankle edema for eight years.

Examination —The patient was admitted in shock. with a temperature of 100, pulse, 140, and blood pressure, 90/60 Tho abdomen was tense A vaginal examination revealed a very hard, tender mass in the posterior cul-de-sac. The cervix was tender on motion Tho uterus and adness were not A diagnosis of a ruptured ectopic (left) palpable pregnancy and endocarditis was made died twenty-eight hours after admission and twenty four hours after operation A local infiltration anesthesia was used, and a transfusion of 550 cc whole The operation revealed massive abblood given dominal hemorrhage, a right salpingectomy was The patient was a poor risk, both medically and surgically

Case 2 -(23079) A colored female, age 29, had a history of vomiting and abdominal pain for forty eight hours prior to admission. Menses occurred on the fourteenth, at an irregular interval of twenty one to thirty-five days, and a duration of four days, one month amenorrhea occurred She had been married two years, with no pregnancy A previous operation was performed at age 20, the nature of which was unknown Examination revealed the abdomen to be distended and tympanite with tenderness over the entire lower portion. A well-healed midline scar was evident nal examination showed a tender cervit, but 10 masses were palpable on account of distention. The temperature was 102, pulse 118, respiration, 30 The red blood count was 3,290,000, white blood count, 10,000, and hemoglobin, 65 per cent The Wassermann test was 4 plus Vaginal and urethral She had a sedimentation smear were negative rato of 18 mm in thirty minutes A diagnosis of toric paralytic ilius with postoperative adhesions with made Operative findings were of adherent left There were adhesions ruptured ectopic pregnancy of small and large intestines and omentum to the anterior abdominal wall A left salpingectomy, separation of adhesions, and appendectom; were She died four days postoperatively of performed peritonitis

Case 3—(30026) The patient was admitted with a history of vaginal bleeding and pain on left side of the abdomen for two months prior to admission. She had no missed periods, but bled intermittently with pelvic cramps for two weeks after last menstruation. She was para II and gravid II. Her blood pressure was 132/70. The abdomen was not distended, but tender throughout pelvis. A vaginal examination reveale.

what the Wagner bill undertakes to guarantee to the people"

Over half a million women pledged themselves, through their delegates, to conduct active programs in their own states among clubwomen and the women of other interested organizations. The principal objectives were (1) survey of public health facilities and activities, (2) evaluation of community public-health needs, and (3) interpretation of public-health programs

"The closing address, Today and Tomorrow in Public Health," by Surgeon General Thomas Parran, embodied an analysis of the public-health problem, a statement of national public health objectives, an interpretation of world cooperation in health, and a charge to the women of the country to participate in public-health programs Excerpts from Dr Parran's address follow

"We in the United States have accomplished.

<sup>1</sup> Vol. 22, No. 16 April 16, 1918.

much toward improving the health of all the people, but no nation in the world has gone as far as it can toward achieving good health within its borders. The time has come when every state and community should begin to study their health needs more intensively—for community organization and community responsibility for health services are basic to the progress of the nation as a whole

"In planning for the future, we all need to make certain assumptions about the type of society in which we can best function We shall assume

"'1 That full employment with a continuing high level of national income is a basis of progress in public health

"'2 That all citizens should have equal opportunity to regain and maintain health to

the extent of their capacity

- "'3 That the whole problem of public health and medical care will require a combination of public and private action, utilizing all resources
- "'4 That the Federal Government would assist the states in order to promote advancement in the less privileged communities
- "' Victory—incomplete as it is—over infectious diseases has changed the principal causes of death. In this country cancer is now the second most frequent cause of death. In 1940 the death rate for cancer was ten times the rate in 1880, and for diabetics it was seven times as high as then
- "So the health needs of the nation though not the same in some respects as they were saty years ago, are still present—still an important challenge. The war has thrown our health needs into bold rehef. Many of them were pointed up when the Selective Service and induction centers rejected 36 per cent of the men they examined thousands of them for preventable or curable conditions such as syphilis, herma, and the residuals of infectious diseases
- "' We have been assembling information on the postwar health needs of the nation and as a result of our studies it is possible to chart broad objectives
  - "'1 A hospital system for the provision of complete medical service for every citizen
  - "'2 Expanded public-health services in every part of the country
  - "'3 Adequate water supplies and other sanitary facilities
    - "4 Medical care for all
    - "5 Augmented medical research, and
  - "'6 Training of health and medical personnel in adequate numbers'"

It is encouraging to observe this growing interest on the part of the women in the broad aspects of public health. For certainly the acceptance of the newer things in medicine is dependent upon a wider dissemination of information concerning them than we have yet been able to accomplish. It is to be hoped that these delegates will return to their various localities stimulated to a better understanding of the publichealth problems of their communities.

Rabies in dogs continues to Rabies spread in upstate New York As has been pointed out in previous issues of Health News, since 1943 new areas have become involved, particularly in the western and south-central parts of the State June 15, a total of 324 rabid animals, all but 5 proved so by laboratory examination, have been discovered and reported to the state health authorities this year figure exceeds the 313 rabid animals reported for the entire year of 1944, and the average annual total of 104 reported rabid animals for the five-year period 1939–1943 At the present time portions of fourteen upstate counties are under certification for the presence of rabies The most recent additions to this list are Onondaga and Cortland counties, which were completely certified on June 6, 1945, and also Tioga and parts of Niagara County, portions of which have been certified since January, 1945 To complete this list, parts of Erie, Chautauqua, Cattaraugus, Orleans, Monroe, Broome, Chenango, Delaware, Rockland, and Westchester counties are likewise under certification for the presence of ra-

In these areas Section 25-a of the New York State Public Health Law becomes operative, requiring that dogs not be allowed at large elsewhere than on the premises of the owner, or on the premises of another person with the knowledge and assent of such person. In addition, during this period any duly appointed dog warden or any peace officer shall, and any other person may, seize and confine or kill any dog found at large in violation of this section. An opinion from the Attorney General states that a dog on leash is not "at large" within the meaning of this statute

#### PRINCIPLES IN THE TREATMENT OF CHRONIC HEADACHE

ARNOLD P FRIEDMAN, MD, and CHARLES BRENNER, MD, New York City

(From the Division of Neuropsychiatry Montefiore Hospital and the Department of Neurology, College of Physicians and Surgeons Columbia University)

A NY discussion of the treatment of beadache that headache is a symptom, not a disease, and it should always be our aim to direct our therapeutic efforts toward the cure or elimination of the disease process underlying any particular symptom rather than directly in the symptom riself. The situation is made still more difficult in the case of headache by the fact that this symptom is found in connection with such a variety of diseases many of them totally dissimilar, as, for example, brain tumor and chronic nephritis

Many of the causes of headaches are acute illnesses which either run their course or are cured within a relatively short period of time aches of this type do not ordinarily present any particular problem to the physician The situation is very different with another large class of nationts whose headaches with much accompanying distress and discomfort occur intermittently for months or years We propose in the present paper to limit ourselves to consideration of three types of headaches belonging to this latter group migraine, psychogenic headaches, and post-traumatic headaches. These three types constitute the majority of longstanding, recurrent headnehes and they are for that reason of practical importance to the practicing physician to whom they frequently present difficult therapeutic problems

Our experiences indicate that there are two principal modes of therapy for these common types of headaches. They are drug therapy and psychologic therapy, or, as it is often abbreviated, psychotherapy. We shall try first to demonstrate the desirability of a twofold approach and then proceed to a brief discussion of each approach.

A recent study of post-traumatio headache demonstrated the importance of both psychologic and physical factors in the production of prolonged post-traumatic headache in the majority of the cases. The incidence of such prolonged headaches was high among patients with symptoms of marked, immediate, emotional reaction to the injury and those with complicating environmental factors which might be presumed to cause unusual emotional stress, it was low among patients with a very mild head injury and those who were injured while playing (that is, in recreational accidents). From these findings it loga-

cally follows that in the treatment of such patients attention should be paid to both physical and psychologic finators

A smilar twofold etiologic relationship is frequently demonstrable in patients with migraine headaches, where there is doubtless a constitutional predisposition and much is known about details of the physiologic mechanism responsible for the headache itself. The following case, which illustrates these relationships, is taken from a group of patients who have been seen at the Monteñore Hospital during the past six months.

Case 1—G Z, a male attorney aged 32 years, had been suffering with attacks of migraine since his graduation from law school four years previous to examination. There was nothing noteworthy on physical or neurologic examination. Ergotamine tartrate was helpful in controlling or nileviating the attacks but even with its help tha patient was not always successful in avoiding severe discomfort.

After some study it was ascertained that the migraina headaches occurred most often the evening before the patient was to appear in court or on a Sunday when he did no work at all. It also became apparent in the course of successive visits that the patient exhibited considerable evidence of psychologic tension

After a period of psychotherapy and adjustment the patient became able to attend court without precipitating any attack, and to onjoy his holidays. The frequency of his attacks was markedly reduced they became of aborter duration and were now in variably relieved by the use of ergotamine turtrate

If we turn now to n discussion of the forms of therapy themselves, we may first discuss briefly the available drugs. Table I lists some of the more common drugs that are used, or whose use has been suggested, in the treatment of headaches of various sorts. From these drugs we can select the more important ones and discuss them in relation to their use in the treatment of certain types of headache.

The first type of headache we wish to discuss briefly is often referred to as psychogenic. These patients are without any evidence of organic discusse. They are cluefly females nithough the male sex is not without representation. They usually have had headaches for many years (15-25), the onest being insidious, occurring as recurrent acute headaches or as continuous chronic types. Their location and type are variable and they may be preceded by preliminary reactions such as sensitivity to light nauses dimness of

#### TABLE I - DEUGS USED IN TREATMENT OF HEADACHE

Analgesics
Coal-tar derivatives
Opiates
Demerol
Sedatives (to decrease tension)
Barbiturates (long medium, and short acting)
Bromides
Drugs Acting On Autonomic Nervous System
Sympathomimetic
Ephedrine
Epinephrine
Benredrine
Dexedrine
Parasympathomimetic
Prostigmine
Cholin esters

Drugs Acting on Blood Vessels
Vasodilators
Amyl nitrite
Histamine
Carbogen
Alcohol
Vasoconstrictors
Caffeine
Ergotamine tartrate

Drugs Affecting Volume and Composition of Body Fluids Glucose Sucrose Magnesium sulphate Calcium

Miscellaneous
Hormones
Vitamins
Peptones—specific antigens

vision, etc. Practically all are accentuated by the menstrual period in its onset or during the actual time of menstruation We have found that aspirin compound (aspirin, phenacetin, and caffeine) in quantities of 10 to 15 grains gives temporary but quite effective relief in this type of headache The use of any of the opium derivatives is contraindicated for obvious reasons However, as an adjunct to the aspirin compound tablets, we use one of the short acting barbitals with its sedative effect to give a more prolonged and efficient relief Considerable emphasis has been given to hormones in the treatment of these headaches but in our experience benefit from their use has been extremely limited Testosterone acetate given usually in 25 mg intramuscular injections ten, seven, and three days before the menstrual period gives relief in some cases to the patients with headaches during the premenstrual and menstrual period Stilbesterol given in small quantities, ie, 01 mg, graduating to 1 mg daily, is sometimes helpful in relieving the headaches which occur in the menopausal periods

The second type of headache we wish to discuss, is migraine whose symptomatology is well known and will not be reviewed here. Ergotamine tartrate is by far the best drug in the treatment of migraine. However, the concentration of the drug given is most important if the treatment is to be at all successful. At the start of each

attack we give four or five 1 mg tablets either sublingually or orally These are followed at one-half hour intervals by 1 mg tablets for a period of two hours until a total of eight or nine tablets have been taken. It is most important that the drug be given early in the attack or in the prodromal period On occasions it is necessary to give the ergotamine parenterally bined with the ergotamine we use a combination of short and medium acting barbital (0.05 Gm of "seconal sodium" and 0.05 Gm of "sodium amytal") which in a few cases has aborted the attacks without the use of ergotamine therapy as quiet, warm baths, etc, are often useful adjuncts to treatment Other therapy. such as vitamins, hormones, oxygen, etc., are practically of no avail in the treatment of mi-

The third type of headache which we wish to discuss occurs after a minor or serious injury to the head and is usually part of the post-traumatic syndrome (recurrent headaches, dizziness, fears, anxiety, fatigue, and inability to concentrate) A small number of our patients with post-traumatic headache of several months' duration were given 01 mg of histamine base intravenously with encouraging results Treatment of the immediate post-traumatic headache by spinal puncture was not in itself effective in another group of cases studied in California, one of the authors found that intravenous, hypertonic sucrose solution would give temporary relief to the immediate post-traumatic headache in a high percentage of the cases of severe head Codeine, aspirin compound, and shortmurv acting barbiturates are of value in the treatment of the immediate post-traumatic headaches Codeme is to be avoided in prolonged treatment of these headaches

In the treatment of a majority of patients with any of these types of headaches, drug therapy alone will not be completely successful A maximum therapeutic result can be obtained only if, in conjunction with drug therapy, one also carries out some form of psychologic treatment. The vastness of this subject makes it impractical to discuss it in any but a brief outline form.

The fact that bodily changes can be brought about by emotional stimuli just as effectively as by bacteria, toxins, or trauma is well known, but how is one to make use of this fact in the approach to the problem of the treatment of headache? The method of history taking is of utmost importance. Both the subject organization, which gives a cross section of the patient's present difficulty, and the personality organization, which gives a longitudinal section of the life of the patient, are necessary parts of the examination of

a patient with headaches. An attempt is made to determine what are the factors in the person ality and environment which precipitate the headaches and the dynamics in olved. In some cases this may be quite simple but in others it very difficult because there may be repressed material of which the patient is unaware

A brief summary of the case histories of two patients whose headaches were associated with emotional factors are presented below

Case 2 -M L., a 42-year-old, white housewife came to the clinic complaining of intermittent, sharp, hifrontal headaches which had been present for ten years. The frequency was somewhat irregu lar but at the time she came to the clinic, she was having headaches two or three times a week each of which lasted from one to two days. She com plained hitterly of the pain, though she was usually able to continue her daily duties. She had tried many of the usual analgenes without any appreciable relief before coming to the clinic. She com plained of no other symptoms and general physical and neurologic examinations were entirely negative. However, In the interviews which followed her first visit, it became apparent that her headaches were precipitated by many situations in which she became tense and anxious. For example, she placed great emphasis on her cooking and housekeeping ability and was very sensitive to any shortcomings or failure in these activities. Before guests would arrive, she often would show signs of considerable emotional stress and apprehension that things might not go quite correctly Once when the roast she was preparine for a dinner party burned, she daveloped such a severe headache that it was necessary to call in a physician At other times her headaches were related to anxiety and suspense about her son who was in the Army and who for several weeks, ex pected daily to receive orders transferring him to active duty abroad

The relation of her headaches to her emotional stata was demonstrated to the patient, an opportunity to ventilate her various anxieties was afforded in the course of the interviews, and she was encouraged to dovelop new and more varied interests mild seatation (phenobarbital, <sup>1</sup>/<sub>2</sub>, grams was employed for several weeks as well as aspirin to be taken when she had headaches. Under this regimen her headaches rapidly diminished in frequency and severity and at the time of writing she had a head ache only once in two weeks and those were relatively, mild and lasted only three to four hours.

Cass 5 — M S, a 40-year-old, white housewife came to the clinic complaining of intermittent, dull, bilateral frontotemporal headaches for the past five years. These occurred two to three times a week, lasted from three to five hours and caused great distress, though also was able to continue her delly tasks despite them. The headaches were often accommanied by a feeling of light headedness or giddiness and paresthesias of the scalp. She also complained of feeling anxious whenever her head ached.

There were no other symptoms and general physical and neurologic examinations were normal. After a number of interviews there was established a relationship between her headaches and the frequent visits of her father-in-law Questioning under sodium amytal revealed that he had attempted to seduce her six year-old niece several years previously, but only the patient was aware of this fact and had kept secret from the family her fear of this man His arrival at her house or even the knowledge of his visit was followed by a headache

In subsequent interviews during the next few weeks the entire situation as well as her reaction to it was discussed. Sha was encouraged to discuss the matter with her husband in order that he might share responsibility in the matter with her and to rehere her of some of her fear of her father-in-law. The relationship between her hasdaches and her fear was also demonstrated and discussed. Since that time (four months at present) the patient has had no further headaches.

In all of these patients catharsis or ventilation, desensitisation, direction, and re-education are part of the therapy. In this manner the patients are made aware of drives and aims they never fully recognised. Attempts are made to modify the underlying tension and alter the environment so as to develop a more normal pattern of life. This is an important therapeutic and in success of treatment from the standpoint of permanency, for by redirecting his energy and pointing out the defects in his manner of attempting to meet his difficulties, one gives the patient a sense of security in his everyday life which may result in elimination of the headaches.

In conclusion, it must be emphasized that in the vast majority of the patients who come to practicing physicians complaining of headache psychologic factors are present which tend to increase the frequency and seventy of headaches even though an underlying organic disturbance is even though an underlying organic disturbance is present. Therapy must, therefore, be directed toward psychologic disturbances as well as toward the physiologic factors. Unless the patient is mabled to cope with his psychologic problems, chances for a therapeutic success are minimal although the relief of the presenting complaint—pain—may be temporarily achieved by the use of drug therapy.

#### AN ESSENTIAL APPROACH TO REHABILITATION

DAVID R SALMON, BA, EDM, New York City

TN THE solution of our national rehabilitation 1 problems, there are three considerations of paramount importance first, a revision of the views of some people concerning procedures in vocational training, second, a fuller comprehension of the importance of education through public relations, and third, the vital necessity for unification of effort to a successful rehabilitation program

With World War I, the importance of economic adjustment for the handicapped slowly This adjustment is more gained recognition readily effected in one war year than in several ordinary years because special attention is focused on all available industrial manpower, industry is not geared rigidly to ordinary economies, and the ranks of the handicapped are augmented by disabled servicemen

What course has this economic adjustment taken? For years we trained the handicapped vocationally on the premise that such training was the answer to the rehabilitation problem Little thought was given by the trainer or the vocational counselor, who was slowly coming into the picture, to whether there would be specific jobs in the community wherein the handicapped could place to advantage their newly found skills Regardless of the amount of disablement in individual cases, excessive emphasis was placed upon the type of training necessary for jobs in sheltered The sheltered workshop was the workshops catch-all for the handicapped At the present time, a close study of the specific incapacities involved in a given disability and the use of job, analyses provide data indicating that the handicapped can successfully fill many more types of jobs than had been even suspected and in such positions can compete with able-bodied workers However, in the overemphasis on vocational training of those of the handicapped who are strictly limited in competence and aptitude, we minimize the chances of those handicapped who might very well be assets in normal industry on a skilled level The inherently inept handicapped person, like the inept able-bodied person, might far better be made versatile at a lower occupational level where he can adapt himself to the stresses and strains of economic changes, than to be placed in a position where he is made to compete at a highly skilled level with the capable ablebodied and the adept handicapped When we consider that the majority of what we term the normal population is composed of unskilled workers who must accept various unskilled jobs, we

may well question our present training procedures wherein the assumption is generally made that the development of a single skill is the key to vocational adjustment for all the liandicapped

It was to a far greater extent the abnormal economic condition brought about by the war, rather than the technical advances in vocational guidance and training, which allowed the handicapped in such comparatively large numbers to leave that group known as marginal employees and take their places alongside able-bodied workers The war has clearly brought out the sociologic significance of unemployment in the case of the handicapped who have now proved themselves as capable workers Whether the technical advances in guidance and training will suffice in the vocational adjustment of the handicapped under peacetime conditions is the question that will assume increasing importance as the need for manpower decreases It cannot be overemphasized that vocational rehabilitation of the handicapped entails a right-about-face by the public in its acceptance of handicapped labor Isolated instances of on-the-job demonstrations with the handicapped for the employer's benefit are en-This question must in all tirely inadequate necessity be posed what penetrating approach shall we take to direct the minds of potential employers who naturally think in terms of profit and loss? The answer lies in a constructive and thorough program of education through public relations in which awareness of the problems involved in rehabilitation shall as far as possible become the common knowledge of the community and the nation as a whole, rather than of medical and social service groups alone Unscientific use of the terms blind, cardiac, tuberculous, and so forth without full knowledge of the exact degree of disablement proves a great difficulty in the vocational adjustment of the handicapped There must be a clarification of such semantic maccuracies on the part of industrialists and those in public office whose decisions will largely determine whether the handicapped will be put to work, particularly under postwar economic con-With the inevitable downward swing of the business cycle along with the inevitable slackening of patriotic wartime tension, the need for such a program grows

The tendency remains too strong in the almost exclusive direction of vocational training Public taxes and private donations are earmarked for only that When we ask the question, "Train for what?," we forcefully realize that the jobs must be created within the industries in the communities. Hordin lies the need for a program of education through public relations—only when the maximum number of employers in the country are reached and fully informed of the capabilities of the handicapped for specific jobs will the jobs be created for them as readily as for ablebodied workers.

As an example of the assurance of jobs through a practical public relations program I would point out the aid that has been given to the blind masseurs by the English who have taken a farseeing step in the vocational adjustment of that handicapped group. The hlind masseur encounters difficulties because of the usual mability of the layman to separate special capabilities from the idea of handicap in general The medical profession in England, through its cooperative support, is largely responsible for revealing the skill of the blind masseur to the public, and a livelihood in his chosen field has thus been opened to Before entrance is granted to the Dichholtz Institute of Massage and Physiotherapy for the Blind in London, the prospective blind masseur is required to furnish a consensus from at least six medical men in the district in which he hopes to practice that there is scope for the masseur in the locality and a promise that they will consider helping him by sending patients. Further, he is asked to produce some indication from the local authority of his area that it will use its influence to secure for him a hospital appointment. In England, blind masseurs may not advertise but in this connection the Association for Certificated Blind Masseurs is able to undertake suitable forms of advertising and to arrange for general publicity so as to keep the work of the blind masseur constantly before the medical profession and the general public. The Association has strong medical backing, and advertisements are inserted in medical and lay papers describing the qualifications of its members

A sound public relations program is of particular importance in the rehabilitation of the severely disabled. Such disabilities are often unhappily accompanied by some impairment of spirit. The expression, "Man does not live by bread alone," is particularly apposite in the case of the disabled individual and the more severe the disability, the greater the application. It is nor

ŧ

responsibility to use the facilities of public relations to educate the families of the severely disabled, the teachers, the foremen and the supervisors, and all others with whom they come in contact in their daily activities. Such education must reveal that in restoring morale, physical disability is at the same tuno more than proportionately overcome To whom falls this task of education? To the physician and the psychiatrist, to the churchman who provides a spiritual buovancy that minimizes the significance of physical and mental pain, to the mother, wife, friend, or guidance counselor who see in the rehabilitation of the spirit the foundation of the rehabilitation of the total personality Obtain the cooperation of physician and clergyman in the establish ment of a sound public relations program, emphasize adequately the importance of reconstitution of morale, and you begin to see the answer to the plaintive question of the severely disabled veteran, "What am I good for now?"

It is through a unification of effort resulting from the cooperation of all groups concerned with total rehabilitation—physical rehabilitation, mental, social, vocational and economic, in a word, rehabilitation of the total personality—that such a public relations program can be effectively pursued

The increasing national dependence on the facilities and programs of welfare agencies for the landicapped presents an extraordinary challenge to such agencies, whether they will break with tradition where socially necessary will indicate their ability to properly act in behalf of the handicapped. They must constructively aid in the proper reintegration of the handicapped into the nation's economy through the pooling of their scientific knowledge. Promises to returning veterans must be revealed as more than empty protests of obligation.

If rehabilitation of the handicapped is a sound social investment, we who today are concerned with this vital social problem must be alert in the nature and trend of our vocational training programs, we must reach the individual, the community, and the nation through the time-proved efficacy of education through public relations and we must proceed with an assurance that can rise only from a philosophy of cooperative endeavor.

# AN EVALUATION OF ECTOPIC PREGNANCY WITH SELECTIVE DATA FROM 127 CONSECUTIVE CASES

SAMUEL L SIEGLER, M D , F A C S , Brooklyn, New York

(From the Gynecological Service of the Unity Hospital)

In THE past few years an extensive literature has been devoted to the subject of ectopic pregnancy. A further evaluation of this subject, its causative factors, clinical manifestations, diagnosis, treatment, and subsequent fertility is necessary because its variable clinical aspects in many instances present difficulties in its recognition. Various studies<sup>1,2</sup> give the incidence of incorrect diagnosis ranging from 15 per cent to 40 per cent, with a mortality rate of 70 per cent to 80 per cent in cases in which there is no intervention and a 3 per cent to 5 per cent death rate in which operation is performed too late.

The material for this study consists of 127 consecutive cases of ectopic pregnancy admitted to the Unity Hospital from January, 1930, to January, 1945. All of these cases were proved extrauterine pregnancies by operation, autopsy, and/or tissue study. Cases here reported were treated by members of the gynecologic and surgical staffs on the hospital service.

The cases reported here occurred among 5,568 gynecologic admissions, representing an incidence of 2 3 per cent. Thirteen thousand five hundred and fifty-two deliveries occurred during this period, 401 of which were stillbirths (incidence of 29 6 per 1,000 births). There were also 1,424 abortions and miscarriages under twenty weeks (an incidence of 105 per 1,000 births), giving an incidence of one ectopic pregnancy to 117 9 pregnancies or 8.2 per 1,000 pregnancies. The true percentage ratio of ectopic to normal pregnancies and abortions, however, cannot be obtained, for while most patients with ectopic pregnancies are hospitalized, many with abortions are not

The largest number of cases were noted in the age group between 21 and 30 years (72 cases, 5 per cent) There were 6 patients under 20 years (5 per cent), the youngest being 17, 44 patients (34 per cent) were between 31 and 40 years and 5 patients were over 40 years, the oldest being 43 years

## History of Previous Pregnancies Prior to Ectopic Gestation

In 31 cases (24 5 per cent), the ectopic pregnancy was the first pregnancy, in 43 cases (33 9 per cent) there had been one preceding pregnancy, in 34 cases (26 8 per cent) there had been two previous pregnancies, and in 19 cases (14.8)

per cent) there had been from three to six pregnancies. The incidence of ectopic pregnancy seems to be considerably lower in the nullipara than in the group in which the patients have been pregnant once or twice before. The sequelae of abortion and curettage contribute to the incidence of ectopic gestation. Thirty-eight patients (30 per cent) had conceived but had not continued to term, 34 having terminated in abortions and 4 (35 per cent) in ectopic gestation, one patient having had six previous induced abortions.

The cases of repeated ectopic pregnancies occurred 2 at two years, 1 at three, and 1 eight years previously. This probably indicates that the factors that produce the ectopic pregnancy are present in both tubes and in many instances peritoneal adhesions or chronic salpingitis can be demonstrated at the first operation. But since tubal gestation is most prevalent during the reproductive age and the desire for future child-bearing in these cases is almost always present, one should hesitate in the removal of the other tube even though there may be the potential risk of the occurrence of a second ectopic pregnancy.

It is difficult to draw any definite conclusions from the marital status in cases of ectopic preg-One fact, however, seems significant, that despite the high degree of fertility in women in whom ectopic pregnancy developed, a relatively sterile period of three years or more preceded the abnormal pregnancy in more than twothirds of the cases studied In one instance, however, ectopic pregnancy had occurred as early as five months after delivery of a normal child and in another instance as late as after eighteen years of infertility To be sure, the question always arises as to whether the causative factor in many of these instances of relative or acquired infertility may not have been due to endocrine imbalance, infection, contraception, or lowered fertility index of one or both partners following the previous pregnancies

Etrology—Many theories have been advanced to explain the genesis of ectopic gestation. A discussion of these is beyond the scope of this paper. From accumulated data, 4 however, it seems that they are closely associated with one another, the ovum may develop its capacity for implantation before it reaches the uterus, and hence it is

too large for passage through the tube, or there may be a disturbance in the transportation of the fertilized ovum, congenital or acquired, trophic or mechanical in origin. Typical decidual reaction in the capsule of the ectopic pregnancy was found in 14 cases in this series, appearing in proportion to the response to the number and condition of chorionic villi present. Whether or not such ectopic decidua is hoteroplastic, as described by Marchotti, for true endometrial stroma cella—endometrioss—is biologic and academic and not of clinical importance.

The infectious cause and its residua produced the largest percentage of extrauterine pregnations. Salpingitis was found in 28 cases (23 per cent), a history of one or more abortions in 34 cases (27 per cent), of postpartum lafection in 3 cases (2 per cent), of appendectomies in 16 cases (12 per cent), of pertonitis in 2 cases, of ophorectomies in 4 cases (3 per cent), and of previous abdominal operations of an unknown nature in 9 cases (7 per cent).

Three cases (2 per cent) of ectople gestation one of which was recurrent, occurred in this series, following tubal insufflation to overcome a

partially occluded or stenotic tube

Symptomology —The symptomatology in cases of ectopic pregnatory is variable and is dependent upon the time when the case is first seen. The two most common complaints in this series were

abdominal pain and vaginal bleeding

Pain—Every adjective descriptive of pain had been used by the patients in this series, from one of being dull, colleky and intermittent, to an acute, sudden, sharp, severe, persistent, agonizing pain which forced the patient to immediately suspend all activities. This pain was in Instances diffuse and/or generalized in distribution, localized in the hypogastrum, epigastrum, para-umbilical regions and radiated to the shoulder, back of thighs, hiadder, and rectum

In 114 cases (89 per cent) the first complaint The character of the pain was abdominai pain varied according to the pathologic process pres-In 56 cases (44 per cent), the onset was acute, sudden, severe, and perastent-in several instances accompanied with a desire to deferatewhich was indicative of tubal rupture. In 46 cases (40 per cent) It was moderate, and in 14 cases (11 per cent), intermittent and colicky, resembling the pain in uterine abortion the latter were unruptured ectopic pregnancies, the pain in these cases, however, being described as a soreness in the pelvis. Intermittent vaganal spotting of a "muddy" color was seen in all 14 cases, in 5 in which there was no history of a missed period, the spotting occurred two to four weeks after the last regular menstrual period

Shoulder pain was reported by 16 patients

Sovere bladder and rectal pain with radiation to the thighs was noted in four instances

Vaginal Bleeding—Vaginal bleeding of an anomalous or atypical nature was seen in 110 cases (87 per cent) and was described as profits, brownish spotting, and/or mixed with clota These may be grouped as follows

1 Menses occurring at normal time but pro-

longed, 39 cases (31 per cent)

- 2 Menses occurring at normal time but diminished flow, described as spotting in 23 cases (18 per cent)
- 3 Menses delayed for reveral days to several weeks, 48 cases (38 per cent)
- 4 No bleeding until the onset of symptoms, 17 cases (13 per cent)

In the first two groups the analysis may be inconclusive, for not infrequently these were the patient's interpretation of "never having missed a pened". A painstaking menstrual history is imperative for Frankel's dictum of "the only regularity of a woman's menstrual period is its irregularity" is well illustrated here.

There was a significant difference in the dura tion of amenorrhen in relation to the site of ectopic gestation in this series in ruptured ectopic, 33.5 days, in tubal abortion, 41.2 days, and in unruptured ectopic, 53 7 days with one case of combined intrauterine (missed abortion) and abdominal pregnancy (fetus about five months) of an amenorrhea of ten months' duration death of the embryo and other hormonal changes associated with it cause the vaginal bleeding in ectopic pregnancy This irregular bleeding with partial or delayed necrosis or involution and desquamation of the uterme decidua is due to 15chemia produced by physiologic vascular constriction of the circular arterioles in the mucous membrane of the nterus, in all respects similar to the bleeding and disposal mechanism of menstrus

Shock—The degree of shock is not always commensurate with the amount of hiesding. Somo women will have very little shock with severe ab dominal hleeding while others will react very acutely with collapse at relatively slight intraabdominal bleeding. Twenty-six patients (20 per cent) were admitted in shock or collapse while 69 (54 per cent) gave a history of faintness or syncope

Nausea and/or vomiting were present in 31 patients (24 per cent). In most instances it was associated with the sudden attacks, and in others it simulated morning suckness of pregnancy and was associated with breast pain. In one instance of combined intra- and extrauterine pregnancy, it was present for five months. In general, the concomitant symptoms of pregnancy are un reliable and infrequent in ectopic pregnancy with

the exception of the group of unruptured tubal, ovarian, or abdominal pregnancy where they may persist

Physical Findings - The physical findings varied with the type of ectopic gestation dominal tenderness was present in 122 cases (96 It was generalized in 66 cases (52 per per cent) cent), localized either to the left or right side in 56 cases (44 per cent) Rigidity was present in 23 cases (18 per cent), abdominal distention was present in 13 cases (10 per cent), and an abdominal mass was noted in 38 cases (30 per cent) A pelvic examination was carried out in all but one patient, who was in extremis on admission The two most constant findings were that of an exquisitely tender cervix and a tender palpable mass in either adnexal region or cul-de-sac cervix was noted to be soft in 26 cases (33 per cent), and tender on motion in 59 cases (47 per The uterus was enlarged and softer than normal in 42 cases (53 per cent)—one case being enlarged to the size of an eight-week gestation and another to a fourteen-week gestation eral, if the uterus is soft and enlarged and there are signs of tubal fetal death (as previously noted) one should suspect the presence of twin pregnancies—one in the uterus and the other in the tube Palpable tender adneyal masses were noted in 92 cases (72 per cent) and in the cul-de-sac in 17 cases (13 per cent), and combined adnexal and cul-de-sac in 12 cases (9 per cent)

Blood pressure recordings were significant only in those cases that were in collapse or in those cases in which progressive internal hemorrhage were suspected. In those patients with shock, the blood pressure was below 100. In one instance this was dramatically illustrated before and after pelvic examination. Blood pressure readings before examination were 134/70, and after examination, 60/0. The cause was tubal rupture and intra-abdominal hemorrhage. In the majority of cases, the blood pressure was well maintained.

Pulse and temperature recordings were concomitantly also related to type of ectopic gestation present. In most instances the pulse was rapid, over 120, and temperature subnormal in ruptured ectopic with severe intra-abdominal hemorrhage and collapse. This was followed by a rise to 100 to 101 F. In cases of tubal abortion the temperature was slightly elevated on admission and in unruptured ectopic pregnancy the temperature was normal.

Hematology—In general, due to the anemia present, the assistance offered by the blood examination in this series was not very helpful in differential diagnosis. In this series the leukocyte count varied from 6,000 to 24,500, the latter being in a case of severe intra-abdominal

hemorrhage The white blood count was lowest in the unruptured group. The red blood counts were below 2,000,000 in 4 cases (3 per cent) with ruptured tubal pregnancy, between 2,000,000 and 3,000,000 in 24 cases (19 per cent), and between 3,000,000 and 4,000,000 in 74 cases (58 per cent). Falling red blood counts and hemoglobin and an increase in white blood cells reflected progressive intra-abdominal bleeding.

Sedimentation Rate —This was increased in patients with ruptured ectopic and tubal abortions. It was normal or slightly elevated in the unruptured ectopic as might be expected as a result of pregnancy itself, rather than to the presence of infection in the tube. The elevated sedimentation rates in this series were not conclusive by themselves in evaluation of a differential diagnosis of an ectopic gestation from pelvic inflammatory disease or appendicitis.

Diagnosis — The Aschlim Zondek or Friedman test was done eigliteen times in this series positive twelve times and negative six times the positive cases the diagnoses were not made in 7 cases until the results were returned mission diagnoses in these cases were pelvic inflammatory disease in 3 cases, chronic appendicitis in 1 case, ovarian cyst in 1 case, pelvic abscess in 1 case, and incomplete infected abortion In those of the 6 negative reactions, 2 were diagnosed as ectopic gestations, 1 each as pelvic inflammatory disease—at operation 3 tubal abortion with organized mass in the culde-sac was found, fibromyomata of the uterus which at operation was found to be complicated by an organized interstitial pregnancy, left tuboovarian disease in 2 cases-1 of which was an isthmic rupture which was organized and adherent to the anterior abdominal wall and bladder, and the other, a hematocele in the broad ligament resulting from a tubal isthmic rupture doubtful cases the biologic test is indispensable Excluding abortions and normal uterine pregnancy, a positive test means ectopic pregnancy This was best illustrated in 1 case in which the test was positive in a combined intrauterine pregnancy which became a missed abortion (fibrous placenta tissue found on curettage), and an intra-abdominal extrauterine gestation of five months' duration, in which, although the fetus was not viable, some of its elements must have been

Curettage has a limited but selective value in diagnosis of ectopic gestation. It was performed in 21 cases (17 per cent) prior to operation in this series. Histologic examination of the currettings in 14 cases (67 per cent) showed decidual reaction, fibrosis of the placenta in 1, proliferative endometrium in 2, hyperplasia of the endometrium in 1, and insufficient tissue for diagnosis

in 3 In 3 cases in which the Friedman tests were positive, the curettings showed proliferative endometrium in 1, hyperplastic endometrium in 1, and decidual reaction in 1

As mentioned earlier in this report, physiologically we find a decidual reaction of the endometrium in extrauterine pregnancy analogous to the decidual transformation of the endometrium in intrinterine pregnancy. This decidua is east off as soon as contact between placenta and maternal tissue is severed—as soon as the ovum dies. Curettage is of value in differentiating extrauterine pregnancy from incomplete abortion, for the findings of uterine decidua and no fetal or maternal elements of conception will distinguish it from an intriuterine gestation.

Although the curettage may not show decidual reaction, viable tissuo may still be present in the tube or ebdomen, which will give a positive Friedman reaction. The absence of decidual reaction in the curettings may also be explained on the basis that efter the death of the embryo, and the subsequent gradual but complete disintegration and casting off of the decidua, there is a return of endometrial prohieration. One must remember, however, that the choriouc villi cannot always be demonstrated by the pathologist from the tissue that may be submitted for histologic examination the curettage may not have been complete and the placenta ate mussed viously, the picture as a whole should be taken into consideration in arriving at a diagnosis in these questionable cases. For example, there are those findings and pelvic aigns in cases of persistent corpus luteum cysts, 1 e , a deciduallike reaction in the endometrium, a false positive Friedman test, a tender adnexal mass, and, not infrequently, intermittent vaginal spotting which mimic unruptured tubal pregnancy or tubal abor-

In this series of 127 ectopic pregnancles there were 34 cases (27 per cent) that were incorrectly diagnosed This figure does not include conditions diagnosed as ectopic pregnancy and found not to be so. Incorrect diagnosis in which ectopic pregnancy was found at operation included the following 12 cases of pelvic inflammators disease including acute salpingitis, 6 cases of ovarian cysts including 2 cases diagnosed as ruptured follicular cysts, 3 cases of acute appendica tis. 2 cases of left tubo-ovarian disease, 2 cases of incomplete abortion (one missed), I case of each of the following infected abortion, chronic appendicitis, pelvic abscess, prolapsed ovary, fibromyoma uterus, fibromyoma with intrautenne pregnancy, intrauterine pregnancy, paralytic llius with peritonitis, postoperative adhesions Seventy-one cases (56 per cent) in this series showed the classical picture of ectopic pregnancy, 70 of which were operated upon within twenty four hours Eight cases (11 per cent) were incorrectly diagnosed preoperatively

One patient died prior to operation, having been admitted in extremis with subsequent autors, showing five quarts of free blood in the abdominal cavity. A fetus at three months with the cord attached to the placenta which camo from a rent in the distel end of the right tube was found. The tube was the size of an orange and surrounded by organized clots. The pouch of Douglas was filled with blood and organized clots which had to be dissected from around the uterus. The placenta was attached firmly to the mucosa of the right tube.

It is the obscure case that furnishes a difficult problem as is evidenced by the aforementioned types of cases that ectopic pregnancy can simulate. In such cases the symptoms may be so mild, the complaints so bisaire, and the physical diagnosis so vague that accessory diagnostic refinements are indicated to assist in making a correct diagnosis. In this category there were 17 cases (13 per cent) which were operated upon twenty-four to forty-eight hours after edimical with an incorrect propersitive diagnosis in 5 (29 per cent), and in a group of 39 cases (31 per cent) which were operated upon from twenty-four hours and later, there were 21 cases (54 per cent) incorrectly diagnosed preoperatively

Aspirations of cull-de-eac for diagnosis were done in 7 of these cases in which blood was aspirated and haparotomy immediately performed No harmful effects were seen from this procedure A ruptured foliclo may simulate ruptured ectopic, for in both instances blood is aspirated from the posterior cull-de-sac.

Operative Findings - Regarding the site of the ectopic pregnancy, 61 cases (48 per cent) could be classified as tubal ruptures, either at the 1sthmus or ampulla, and 44 (35 per cent) as tubal There were 17 (13 per cent) unrupabortions tured tubal pregnancies, one of which was bilateral, one cornual (left), two interstitial and one combined (uterine and abdominal), one hematocele in the left broad ligament. The latter two were classified as such, but not proved There were no ovarian pregnancies The final location of the ectopic gestation may not be the original point of nidation and it is not always posaible to determine it

It is a generally accepted theory that because of the frequency of appendicuts being associated with perisalpingitis and adhesions ectopic gestation is more common on the right side than the left. The data in this series were not significant for there were recorded 61 cases (48 per cent) occurring on the right side and 57 (45 per cent) on the left side.

The appendix was removed in 36 cases (28 per cent) in this series. We do not recommend concomitant elective operations with patients in shock, hemorrhage, or suspected infections. Blood in the peritoneal cavity acts as a good culture medium for Bacillus coli. We can reasonably attribute two surgical deaths in this series to removal of the appendix with subsequent peritonitis.

However, these mortalities occurred prior to the use of the sulfa drugs, the use of which might have changed the ultimate results in these two Wherever possible, conservatism should be practiced in operating upon patients with tubal rupture or abortion Abdominal elective operations may be recommended in unruptured tubal pregnancy It is good surgical practice to inspect the other tube, for occasionally a simultaneous tubal pregnancy may occur in that tube, as happened in 1 case in this series General anesthesia is the anesthetic of choice, spinal anesthesia is recommended only for patients operated upon before rupture occurs and in those cases having arterial pressure appropriate for this type of anesthesia. In 81 cases (64 per cent) in this series, gas, oxygen, and ether were the anesthetics used, in 42 cases (33 per cent) spinal, in 2, cyclopropane, and in 1, local novocame infiltration

Transfusions - Experience over a period of years has taught us that exanguinated patients are bad risks whether operated upon or not With severe hemorrhage, there is no marked transition between the state of peritoneal shock and the pieture of internal continuous hemorrhage If allowed to continue, a state of irreversible shock occurs It is our opinion that a large number of patients can be saved if a prompt and massive transfusion of blood plasma or whole blood were available for them Of course, the time to transfuse must be dependent upon the patient's condition In its use, one should not wait too long in the hope that the gravity of the condition is due entirely to shock, instead, a massive transfusion should be given and the patient operated upon immediately because the condition will not improve until the bleeding vessels are ligated Plasma should be used prior to operation until blood is obtained In this series 41 patients (32 per eent) were transfused, the average blood transfused was 500 ce, the largest amount was 1,500 ce Autohemoclysis was done in 2 cases early in this series With plasma and/or blood now available at most hospitals, this procedure is now not necessary

Mortality —There were five deaths (39 per cent) in this series, one having died prior to operation with a surgical mortality of 31 per cent. There were no deaths in this series since 1936

#### Case Reports

Case 1—(18611) The patient was a white female, age 33, with a history of pain in the precordial region and abdomen and vaginal bleeding for four days prier to admission. On the day of admission she had severe abdominal pain and fainted. Menses occurring every twenty-eight days on the fourtcenth, lasted four days. The last menses occurred November 16, 1930, and she was admitted January 2, 1931. She was a widow, had no abortions, miscarriages, or full term pregnancies, but had an ectopic pregnancy two years prior to admission. She had had rheumatic heart disease and ankle edema for eight years.

Examination —The patient was admitted in shock, with a temperature of 100, pulse, 140, and bleed pressure, 90/60 The abdomen was tense vaginal examination revealed a very hard, tender mass in the posterior cul-de-sac. The cervix was tender on motion The uterus and adaeva were not palpable A diagnosis of a ruptured ectopic (left) pregnancy and endocarditis was made The patient died twenty-eight hours after admission and tweaty-A local infiltration aafour hours after operation esthema was used, and a transfusion of 550 cc whole The operation revealed massive abblood given dominal hemorrhage, a right salpingectomy was The patient was a poor risk, both medically

and surgically

Case 2—(23079) A colored female, age 29, had a history of vomiting and abdominal pain for fortyeight hours prior to admission Menses occurred

on the fourteenth, at an irregular interval of twentyone to thirty-five days, and a duration of four days, one month amenorrhea occurred She had been married two years, with no pregnancy A previous operation was performed at age 20, the nature of which was unknown Examination revealed the abdomen to be distended and tympanitic with tenderness over the entire lower portion A well-healed midline scar was evident nal examination showed a tender cervi, but ne masses were palpable on account of distention temperature was 102, pulse 118, respiration, 30 The red blood count was 3,290,000, white bleod count, 10,000, and hemoglobin, 65 per cent Wassermann test was 4 plus Vaginal and urethral She had a sedimentation smear were negative rate of 18 mm in thirty minutes A diagnosis of toxic paralytic ilius with postoperative adhesions was Operative findings were of adherent left ruptured ectopic pregnancy There were adhesions of small and large intestines and omentum to the anterior abdominal wall. A left salpingectomy, separation of adhesions, and appendectomy were She died four days postoperatively ef performed

peritonitis

Case 3—(30026) The patient was admitted with a history of vaginal bleeding and pain on left side of the abdomen for two months prior to admission. She had no missed periods, but bled intermittently with pelvic cramps for two weeks after last menstruation. She was para II and gravid II. Her blood pressure was 132/70. The abdomen was not distended, but tender throughout the lower pelvis. A vaginal examination revealed a mass in

the left forms with n tender cervix. Hemoglobin was 80 per cent, red blood count 3 810,000, white blood count 12 000 sedimentation rate, 30 mm. in one hour, temperature 90 and pulse 110. A dlag nosis of a ruptured left ectopic was made. Operation revealed free blood in abdominal cavity in ruptured left ectopic, and left cystic ovary with corpus luteum of pregnancy. Left salpingectomy cophorectomy, and appendectomy were done. A pathologic report of ectopic gestation corpus luteum cyst, and chrome appendix with an early oxudative inflammation was made. No transfusions were given. The patient died forty-eight hours after operation from portenitis.

Case 4—(32497) Denth prior to operation occurred in a colored female age 32 single admitted in extremis having had abdominal pain at home for one month with intermittent vaginal bleeding Amenorrhea of twelve weeks was reported. She died within six hours after admission. Autopsy findings were as previously described in text

Case 6—(37422) The patient was admitted in shock, and operated upon within five hours after admission. Sile had severe abdominal pain with vomiting twenty four hours prior to admission. There was no vaginal bleeding, and no hastory of nussed period or previous pregnancies. Her hicod pressure was 88/40 temperature 98 and pulse 140 On operation massive abdominal hemorrhage and left cornual rupture were found Left salpingo-ophorectomy and excision of cornua of uterus wore performed. Ether anesthesis was need but no transfusion was given She died thirty hours postoperatively of shock.

### Fertility and Sterility Following Ectopic Pregnancy

Statustics' from various chaics indicate that among women who have one tube and overy removed because of ectopic gestation (that is, in whom there is a theoretic possibility of future conception), about 35 per cent subsequently became pregnant, of these 10 to 15 per cent have another ectopic pregnancy. Stated differently, among one hundred women who have had one tube and overy removed because of ectopic gestation, about sixty-five women would not conceive at all, about thirty women would become pregnant with normal intrauterine pregnances, while four or five would experience another estable pregnancy.

In order to evaluate the fertility and sterility ratios following this series of ectopic pregnancy, we divided this group of cases into those that were sterile after operation and those which still had possibilities of subsequently becoming pregnant.

There were 35 patients (28 per cent) that could not become pregnant for the following various reasons (a) death—5 cases, (b) recurrent ectopic pregnancies—4 cases, (c) hysterectomy—4 cases, (d) bilateral salpingoctomy—10 cases,

and (e) occluded remaining tube as evidenced by tubal insufflation—3 cases

Bilateral salpingectomies were done in these instances because the opposite tube was macroscopically highly disorganized and pathologic and would be prone to recurrent ectopic gestation Statistical data! indicate that repeated ectopic gestations occur in 3.9 per cent of cases and that the mortality rate in these cases is higher than in the primary ectopic pregnancy. In Torre's series, the mortality rate from primary ectopics was 2.40 per cent, whereas for recurrent ectopics it was 4.54 per cent.

Three patients who had repeated tubal in sufflation following ectopic gestations, and who had previously been infertile for several years prior to this ectopic gestation were still infertile—the remaining tube being cocluded

In 00 cases (71 per cent), pregnancies were theoretically possible Follow-up letters were mailed to this group. Fifty-one patients an swered the questionnaire, sixteen were returned as having moved leaving no forwarding address. 1 patient had since died, and 42 patients (85 per cent) answered that menstruction had been normal In 7 (13 per cent) the menstrual history had been irregular Two patients never menstruated again after the operation because of menopause There were 19 (37 per cent) who answered that pregnancy had occurred, 32 (63 per cent) did not conceive and 6 (12 per cent) had used contracen-Of the 19, 1 concerved one year following operation. 3, two years following operation. 5, three years, 4, four years, 2, five years, 1, six years, 1, soven years, 1, eight years, and 1, eleven years

There were eleven full term pregnancies (58 per cent), 4 had two or more pregnancies, there were eight abortions (42 per cent) and one repeated ectopic pregnancy (6 per cent) This occurred eleven years after the first ectopic pregnancy Of the 10 who became pregnant, 4 received treatment for their infertility subsequent to their operations

Of course, one cannot tell whether the cause of the infertility in the group of 20 cases that did not conceive was voluntary, whether the remaining tube was closed, whether the patients were widowed or divorced, or their fertility index gonerally lowered. It is thus obvious that with a salvage of 10 pregnancies (37 per cent) in a series of 51 cases, good surgical judgment was used in not removing the remaining tube in these cases

The remaining tube in ectopic pregnancy, as a result of the massive hemorrhage and peritoneal irritation, may evidence an acute inflammatory reaction, which although usually resolving, may interfere with subsequent fertility by causing peritubal adhesions, endosalpinguis, or tubal

stenosis Hence, we suggest the use of tubal insufflation two months following ectopic gestation, so that any sequelae of the previous ectopic pregnancy which may be present to impede the ascent of the sperm and the descent of the ovum may be determined and possibly relieved

#### Summary and Conclusions

- 1 One hundred and twenty-seven cases of ectopic pregnancy are evaluated There was an incidence of 2 3 per cent ectopic pregnancy to gynecologic admissions, 8 1 per 1,000 pregnancies, or an incidence of one ectopic to 123 4 pregnancies occurred
- 2 Fifty-seven per cent of the cases occurred in the 21 to 30 years age group, the youngest being 17 years and the oldest, 43 years. A long period of sterility was not the rule in this series. Incidence of ectopic gestation was lower in the nulliparous (24.5 per cent) than in those that had children (75.5 per cent). Repeated abortions (29 per cent) increased greatly the incidence of ectopic pregnancy. Repeated ectopics occurred in 3.5 per cent of cases.
- 3 The average relative period of infertility of three years occurred in two-thirds of the cases prior to ectopic pregnancy. The earliest was five months after normal delivery. Infertility, however, may be due to such causative factors as endocrine, contraception, infections, or lowered fertility index of either partner.
- 4 The cause cannot always be determined in ectopic pregnancy, it may be ovular, disturbed transportation, or mechanical. It may be inflammatory as well as noninflammatory or congenital. The residua of pelvic inflammatory disease, appendicitis and other previous operations were factors in 78 per cent of cases.
- 5 Evidence of decidual reaction was noted histologically in 14 cases which may give further credence to the theory of the receptivity of tubal mucosa-ectopic decidua in ectopic pregnancy
- Symptomatology was variable and was dependent upon the time the case was first seen Abdominal pain, seen in 78 per cent of the cases, varied according to the pathologic process present Vaginal bleeding was atypical in 87 per cent In 49 per cent of the cases there was no missed period, but it was prolonged and spotty In 38 per cent there was a history of delay, in 13 per cent none was reported until onset of the symptoms There was a significant difference in the duration of amenorrhea in relation to the site of ectopic gestation in this series In ruptured ectopic pregnancy it lasted 33 5 days, in tubal abortion, 41 2 days, in unruptured ectopic, 53 7 days
- 7 The degree of shock was not always commensurate with the amount of bleeding A his-

- tory of nausea and vomiting was not significant and was unreliable in the diagnosis of ectopic gestation
- 8 Physical findings varied with the type of ectopic gestation Abdominal tenderness occurred in 96 per cent of cases, tender cervix and palpable adnexal masses in 94 per cent
- 9 Blood examination was not conclusive in itself in evaluating a differential diagnosis of ectopic gestation, from pelvic inflammatory disease Erythrocyte sedimentation rate can be increased in pregnancy as well as pelvic inflammatory disease
- 10 The biologic test in this series was of definite value in those cases that were not emergencies and was of help in the differential diagnosis of the suspected case. It should be done more often, particularly when curettage shows a proliferative endometrium
- 11 Curettage has a selective but limited value in diagnosis The microscopic finding of a decidual reaction is not a positive indication of ectopic gestation and, conversely, its absence does not give proof of its presence. The finding of choriomic villi gives evidence of an intrauterine pregnancy.
- 12 Diagnosis was correct in 73 per cent of cases, incorrect in 27 per cent. With the exception of the catastrophic type, ectopic pregnancy simulates many pelvic disorders, the majority of which are pelvic inflammatory disease. Forty-eight per cent of the cases were tubal rupture, 35 per cent tubal abortion, and 13 per cent unruptured tubal pregnancy.
- 13 Mortality rate was 3 9 per cent with a surgical mortality of 3 per cent. This percentage could be improved upon by prompt conservative surgery, massive transfusions and postoperative supportive treatment which would miraculously transform a desperate case to one of a relatively smooth convalescence in a short period of time. Concomitant elective surgery should be done only in the absence of intra-abdominal hemorrhage, shock, and suspected infections. Five mortalities are reported, two can be attributed to peritonitis, two to shock and one non-operative, admitted in extremis.
- gestation 35 cases (29 per cent) were sterile after operation, the majority being due to bilateral salpingitis as a result of chronic pelvic inflammatory disease. In 90 cases (71 per cent) pregnancy was theoretically possible, 51 of these were contacted in the follow-up series—pregnancy occurred in 19 (37 per cent) in from one to eleven years. In this group there were eight abortions, and one recurrent ectopic pregnancy. Such a salvage of pregnancies seems to justify conservative surgical procedures in selected cases in

women of the childbearing age in order to preserve their fertility

In conclusion, one should be "ectopic minded" when given a history of pelvio pain, menstrual irregularity with a tender cervix, and an adnexal mass in a woman in the childbearing age. Once the possibility of its presence is suspected, the patient should be hospitalized and treatment in Hesitating decision in the treatment of ectopic gestation raises the mortality rate It is better to make the mistake of opening an abdomen of questionable early pelvic inflammators disease than to have a death from ruptured ectopic pregnancy The universal availability of plasma and the accessibility of blood banks should definitely reduce its mortality

The author wishes to thank his associate Harold Jacobs (MC) AUS for his assistance in the preparation of the atalistics to the rear 1910

#### 'DOCTOR JONES SAYS-

These accidents-pedestrians being bit by automobiles—it made me think of the Inscription on a gravestone in a Glasgow cometery "Born by accident! Died by accident! Our being born—that was a matter beyond our control But whether we hat somobody with a car or get hit by one—while such an accident will happen occasionally even where reasonable care is being used by both parties, the great majority of 'em could be prevented

The automobile drivers—the way the law operates, it seems to put the burden of the responsibility on them and I s pose there's some justification for

that

They're driving a powerful piece of machinery that, in the hands of caroless or clumsy people can do a lot of damage

But I've wondered sometimes If that idea wasn't carried a little too far in some cases-further than the facts warrant May be it s a reaction from the old days when automobiles were new The people that drove horses or walked-they resented what they considered an encroachment on their right to the road.

The motorists in their linen dusters and goggles -they were kind of cocky-some of 'em tooted their horn a lot and all that It built up sort of a presudice that s tended to hang on.

At any rate there a another side to it And you know, it's funny how our point of view changes those of us that drive cars-depending on whether we're in the car or walking and dodging it. But I was reading that in Los Angeles they found that failure of podestrians to observe reasonable regulations for safe walking accounted for six out of every ten fatal aemdents in traffic. And the greatest single cause of these fatalities in one year was crossing in the middle of the block instead of the regular crossings And another interesting thing they found that the pedestrians that were hit in a large percentage of cases didn't drive cars themselves and weren't familiar with the mechanical limits tions.

So if it a true generally that carelessness on the part of pedestrians is responsible for the majority of this sort of accidents, then, certainly, they should be made to assume their share of the responsibility for avoiding 'em And where they rush in where angels fear to tread, I m not too sure they can qual-If y as angels in ease they're hit -Paul B Brooks M.D., in Health News, June 18, 1945

#### D D T STUDIED FOR OUTDOOR USE HERE

Extensive investigations are now being conducted to determine the benefits and possible hazards in volved in the contemplated use of the insecticide D D T on a large scale outdoors as part of a plan to control insect borno diseases

In the Pacific Theater DDT proved highly valuable in bringing insect-borne diseases under control. However DDT will not be employed indiscriminately in this country until more research work has been completed on the general biologic effects of this insecticide

Besides killing insects that carry diseases DDT may kill other insects that are beneficial-and thus affect the balance of nature which is important to agriculture and wild life In combat zones, where the health of the soldier was at stake, it was necessary to ignore these considerations but in the United States general outdoor applications will not be adopted until more is known about these biologic offects.

-Release from the Office of the Surgeon General, May 15, 1945

# PENICILLIN AND OTHER ANTIBIOTICS AS CHEMOTHERAPEUTIC AGENTS IN WOUND INFECTIONS

ERWIN NETER, M D, Buffalo, New York

(From the Departments of Bacteriology and Immunology, Children's Hospital and University of Buffalo)

LTHOUGH for several decades extensive A studies have been carried out in the search for effective antimicrobial agents of low toxicity. until recently only a limited number of compounds were found to be of chincal value 1935. Domagk's publication on prontosil opened a new phase in chemotherapy Since then various sulfonamide compounds have been successfully employed However, it soon became apparent that these agents have their limitations and are not effective against all micro-organisms Moreover, it is a recognized fact today that the sulfonamides are less potent in localized purulent lesions and that their activity may be reduced or nullified in the presence of peptone, tissue breakdown products, and notably of para-ammoben-It is for these reasons that the search for other chemotherapeutic agents was intensi-It is generally known that penicillin, discovered in 1929 by Alexander Fleming, was reinvestigated a decade later and found to be one of the most active and least toxic chemotherapeutic agents ever discovered But even penicillin has its limitations Other antibiotic agents of biologic origin have been studied during the last few years, thus commencing the investigation which had begun more than forty years ago. It is the purpose of this report to review the effects of penicilin and other antibiotic substances as chemotherapeutic agents in wound infections of animals and man, and to evaluate, as far as it is possible at the present time, the indications for and limitations of these agents

## The Antimicrobial Action of Penicillin in Vitro

Certain facts established by in vitro investigations and animal experiments may be presented first as the basis for a proper understanding of the treatment of wound infections in man

It is now well established that Penicilium notatum produces more than one antibiotic substance. Since most of the research and clinical investigation has been carried out with uncrystallized penicillin, the data presented in this communication refer to these preparations, unless specific mention is made to the contrary. The commercially available penicillin salts are more stable than was previously assumed. A solution of this compound can be stored in the refrigerator for several days without substantial loss in activity.

Susceptible and Insusceptible Micro-organisms -It has been established beyond doubt that penicillin is effective against certain species and markedly less effective or ineffective against In some instances, penicillin inhibits the growth of some groups or types and not of To illustrate this point, mention may be made of the fact that this drug is bacteriostatic against hemolytic streptococcus groups A, B, C, and groups E through N, but not against group According to Watson,1 certain differences in sensitivity may be noted among the various groups Group M strains are more sensitive than groups A, C, G, H, and L, and groups B, E, F, K, and N were less sensitive than the former These observations have clinical implications Moreover, various strains belonging to the same species may differ in their susceptibility to penicillin

For instance, Spink,2 Neter,3 Selbie, Simon, and McIntosh,4 and others have shown that some strains of staphylococci isolated from patients prior to penicillin therapy may be from two to more than ten times less susceptible than Gallardo5 tested the sensitivity to penicillin of bacteria isolated from infected wounds He found that of 85 strains of pathogenic staphylococci 129 per cent were naturally resistant, and 94 per cent acquired the resistance during the course of penicillin therapy The mechanism which is responsible for penicillin resistance is not known in detail, and the formation by microorganisms of penicillinase (an enzyme destroying penicillin) is not the sole operative factor Demerec6 presented evidence that the resistance to penicillin of staphylococcus is not induced by the action of the drug itself but originates through This problem deserves further inmutation vestigation and may become of great clinical significance in the future

Mode of Action of Penicillin —Although it is evident that penicillin inhibits the growth of susceptible micro-organisms, its action is more complicated than being simply bacteriostatic Recent investigations by Hirsch<sup>7</sup> show that penicillin produces a degenerative effect in growing and susceptible micro-organisms, resulting in bacteriostasis, death of the micro-organisms, and occasionally autolysis That this antibiotic agent is more than merely bacteriostatic, also is evidenced by the fact that spirochetes following exposure to penicillin quite rapidly lose their mo-

tility The same opinion has been expressed on the basis of in vitro experiments by Garrod \*

Effects of Environment on Pencullin Action—
It is generally stated that, in contradistinction
to the sulfonamides, tissue fluids, blood, pus, and
break-down products thereof have little, if any,
effect on the antibacterial activity of penicillin
Bigger, however, has shown that penicillin may
be inactivated by serum

It is a recognized fact that an increase in temperature markedly enhances the bacteriostation activity of sulfonamides. Garrod found that the antiataphy lococcal activity of penicillin is accelerated by increasing the temperature throughout the range of 4 to 42 C. On the other hand, it was observed at this laboratory that the bacteriostatic activity of this drug was not markedly enhanced when the curvronmental temperature was raised from 22 to 40 C. At any rate, it is evident from the in vitro experiments that penicillin is effective at temperatures higher than 37 C (as encountered in febrile conditions) and in lower temperatures (as in the skin and wounds)

Synergum of Penicillin and Other Drugs—Confirming Ungar'e original observation, Sochoo and Echnitzer demonstrated the synergistic action of penicillin and sulfapyridine in experimental streptococcal infections of white mice Further studies are definitely needed. There exists another possible approach toward increasing the antimerobial activity of penicillin. Smith and Livingston activity of penicillin. Smith and Livingston activity of penicillin combined with 1 per cent chlorophyll produced better results than either agent alone.

#### Penicillin and Other Antiblotics in Experimental Wound Infections

Although numerous antibiotic substances have been studied in the past, only n limited number have been found to have clinical possibilities, ie, marked antimicrobial activity in vivo and relatively low toxicity Ande from penicillin, tyrothricin, streptothricin, streptomycin, and pyocyanase have been used dinically Tyrothricin was obtained by Dubos from Bacillus brevis It is a mixture of gramicidin and tyrocidine Gramicidin exerts its activity mainly against gram positive coces, whereas tyrouidine is effective in vitro also against some gram-negative bacilli However, in vivo there is little or no effect upon the latter micro-organisms Streptothridin was obtained by Waksman from Actinomycea lavendulao It ects on both gram-negative and gram-Actinomyces griscus yields positive bacteria streptomycin This compound was obtained and studied by Waksman and found to act on gram negative and gram positive bacteria as well as on tubercle bacilli and certain actinomycetes

It seemed of interest to determine the relative

in vivo efficacy of some of these compounds. To this end, an investigation on the action of penicillin, tyrothricin, and etreptothricin upon a strain of Group A hemolytic streptococcus in artificial wounds of rabbits was carried out results, recorded in detail elsewhere,12 may be briefly summarised as follows. It was found that all three antibiotics reduced the number of bemolytic atreptococci in such wounds Penicillin sodium in solution was applied to the wounds, tyrothricin and streptothricin were used in powdered form It is interesting to note that n quantitative relationship exists between the amount of the drugs used and the results obtained cillin in amounts up to 5 units proved to be ineffective In amounts of 250 to 500 units it caused n reduction in the number of hemolytic streptococci in twenty three out of twenty-eight experiments, and in amounts of 5,000 units in all Tyrothricin and strepof thirteen experiments tothrein were equally effective under the conditions of these experiments. It was also observed that these antibiotics exerted far greater antistreptococcal activity than sulfathiasole As a matter of fact, tyrothricin and streptothrican proved to be 100 times more effective than eulfathiazole. This is also borne out by clinical observations.

Although only a few years have elapsed since penicillin was introduced into clinical medicine. many reports pertaining to its effectiveness have been published. The present war presented a unique, though tragic, opportunity for a study of the value of this drug in the treatment of wound infections. A summary of some of these reports on more than 3,000 cases is presented in Table 1 Many different types of lesions, including soft tissue wounds, compound fractures, burns, pyogenie dermatoses and others, were studied. It can be seen from the table that penicillin, used locally or systemically or by both routes, proved to be a very important adjunct to surgical treatment. In many instances it prevented infection or eliminated lt, it reduced the necessity for amputations in some cases, prevented sepsis, and invorably influenced the fatality rate. Some of the failures may be accounted for by madequate amounts of the antibiotic used or by the presence of penicilin-resistant micro-organisms As mentioned above, lower concentrations of penicillin proved to be less effective than higher concentrations in the treatment of experimental wounds infected with hemolytic streptococcus in rabbits Chinically, Grace and Bryson found that in some patients 4,000 units of penicillin per ml yielded better results than a preparation containing only 500 units per ml In one patient, observed by the author, the local administration of penicillin solution containing 250 units per ml.

TABLE I —Penicillin Prophylaxis and Therapy of Localized Infections

		enicilli\ Prophylaxis and		Mode of er Administration	
Author	Refer ence			es of Peniculin	Results
Fisher, A M	13	Wound infections, osteomy elitis, streptococcal throat infection and others	95	Locally	Good in 63% indefinite in 24%, poor in 13%
Bentley F H Thomson, S, Bingham A. K. Key J A, and Wostenholm M H	14	Compound fractures	62	Locally or locally and systemic- ally	Good in all but 2 cases
Bentley, F H, and Thomson, S	15	Battle wounds	61	Locally	26% only hecame infected as compared to 57% treated with
Jeffrey, J S	16	Wounds	100	Locally	sulfamilamide powder 50% were sterils compared to 17% treated with sulfamilamide

Edwards, H C	38	Combat wounds	234	Locally	89% of the wounds healed by
Brown J J M	39	Soft tissne wounds	721	Locally	first intention 914% auccessful Of 110 clean wounds thus treated, success was attained in 936% as compared to 62% of 71 wounds tention with sulfanismide
		Compound fractures	128	Locally and sys-	treated with sulfamismide Local installation is effective and
McEwan J B Bickerton J G, and Piloher M F	40	Compound fractures	64	temically Locally and aya- temically	economical  Systemic treatment good. Ten day oourse using 1,320 000 units yielded better results than five-day treatment (540,-
Bhatia D	41	Compound fractures of	70	Systemically and	(H)() min(e)
Craig et al	42	femur Infected wounds, hema- tomas, and bullet wounds	32	locally	14% deaths as compared to 86% of controls Failure in 2 cases only

failed to eliminate pathogenic staphylococci from a draining purulent lesion, nor did it result in clinical improvement Subsequent treatment with a preparation containing 1,000 units per ml yielded bacteriologic and clinical cure. It is also clear from some of these roports that penicillin is definitely superior to the sulfonamides.

Penucillin salts have been administered to wounds in various vehicles. The following preparations may be briefly mentioned.

Penicilin salt in physiologic saline solution
 The concentration of the drug ranges from 250 to

500 units per ml In certain cases, however, this

concentration seems to be inadequate

2 Pencallin-sulfonamide and pencallin-sulfuthrazole powder containing from 500 to 5,000 units of penicallin per Gm have been successfully used by British investigators

3 Calcium penicillin paste and penicillin cream containing from 100 to 250 units per ce and

Gm., respectively

4 Sodium penicillin powder is said to be irritating to wound surfaces, and consequently,

should not be employed

- 5 Sodrum pencillin-plasma containing from 10, 100 to 20,000 units per 0.2 Gm of dehydrated plasma has been recommended by Cutler and Sandusky. These authors reported that pencillin does not lose its potency when mixed with plasma. This observation, however, is somewhat contrary to the findings of Bigger who showed that serum inactivates poncillin
- 6 Penicillin-agar has been recommended and used successfully in the treatment of infected superficial wounds by Coles, Barker, Robertson and Cowan <sup>42</sup> These authors noted that the antibiotic readily diffuses through the agar and is relatively stable in this vehicle.

In summary, then, it can be said that penicillin is of mestimable value in the prevention and treatment of wound infections. It must be borne in mind, however, that this chemotherapouto agent has its limitations and that penicillin treatment cannot replace medical and surgical therapy.

#### Tyrothricin in the Treatment of Wound Infections in Man

Since 1942 several investigators have published their experience with tyrothricin or gramiedin in the treatment of localized infection. Generally speaking, the results have been favorable in properly selected cases. Rammelkampt' studied the effects of tyrothricin in 12 patients with sixteen localized ulcers. The amount of drug used in n single application varied from 1 to 100 mg. An alcohollo solution of the drug was used. In twelve of these ulcers, tyrothricin therapy re-

sulted in prompt sterilization. It is notoworthy that infections due to gram-negative bacteria or a mixture of gram negative and gram positive micro-organisms were resistant to this form of therapy. Of interest also is the observation that the staphylococcus present in the lesion of one of these patients became markedly resistant to this untiblotic during tyrothricin therapy.

An interesting study was reported by Francis<sup>4</sup> in the same year. This author observed a patient with a localized infection caused by hemolytic streptococcus. This strain proved to be suffonamide-resistant, and treatment with this group of drugs failed to eradicate the organism Local treatment with gramicidin, however, eliminated the streptococcus and made skin-grafting successful

Herrell has published several reports on the clinical use of tyrothricin In 1943\* he reported on 93 cases with infected ulcers and wounds. The results were good or excellent in 51 per cent, fairly good in 31 per cent, and poor in 18 per cent Some of these failures may be accounted for by inadequate docage

In July, 1944, Avale, Barker, and Herrell<sup>47</sup> published their expendence on the use of tyrothricin in the treatment of ulcers associated with peripheral vascular disease. Tyrothricin proved to be of definite value. The drug was suspended in distilled water and the concentration was 500 micrograms per ml.

In 1944 Rankin<sup>41</sup> reported observations on 6 patients with old chronic ulcers treated with tyrothriun. The drug proved to be of great value

in five instances

A preparation similar to gramicidin was isolated by the Russian investigators Gause and Brashnikova. This substance, referred to as Soviet gramicidin or gramicidin S, has been purified and crystallized Against staphylococci it is approximately four times more effective than tyrothrium. Its toxicity is similar to that of tyrothricin. The drug was used by the Soviet investigators in 573 patients. The suspension used contained between 400 and 800 milerograms per ml. The clinical results were favorable.

At the present time, it is not as yet possible to make any final statements concerning the valuo of other antibiotic agents, as, for instance, streptomycin and streptothricin, in the treatment of wound infections. It is clear that pencillin and tyrothricin are of inestimable help in the treatment of localized wound infections as an adjunct to medical and surgical therapy. Certain infections, however, caused by insusceptible micro-organisms, fail to respond to these drugs. An evaluation of other antibiotics of low toxicity and of a different spectrum of activity, is definitely needed, and it can be confidently ex-

6 180 (1944)

pected that these investigations will yield additional compounds of clinical merit

#### FLUOROSCOPY OF METALS AN AID TO INDUSTRY

New developments in the fluoroscopic method for inspecting metallic parts should release appreciable quantities of x-ray film, now in short supply, the Office of Production Research and Development, War Production Board, announced on May 23

The research project for improving the fluoroscopic method was established at the California Institute of Technology, Pasadena, at the request of the aircraft industry, and was carried on under the direct supervision of Dr Maurice Nelles, chief consultant, Office of Production Research and Development

Three improvements in the fluoroscopic method now make this quick examination completely feasible. Briefly, these are (1) stronger, brighter radiation, (2) a new type of absorption cell, and (3) a new technic—swinging the x-ray tube back and forth to make the rays penetrate the metal at all angles.

angles
"The use of x-rays for the inspection of metallic parts, particularly casting and forgings," said Dr

Nelles, "has been common practice for many years In the past it has been necessary to utilize photographic film for recording images of defects since the screens and filters available for fluoroscopic inspection did not permit the observation of all the defects which would significantly affect the strength of the parts

During the war period the increased use of castings for aircraft construction required the use of tremendous amounts of photographic film and excessive numbers of technicians to photograph, develop and interpret the medians of photograph, de-

velop, and interpret the radiographs

The new fluoroscopic method has been compared
with the best of the older radiographic methods, by
installing the equipment in three different commercial radiographic laboratories

The shortage of x-ray film has accelerated efforts to substitute the improved fluoroscopic method of inspection of structural light alloy castings, particularly in the aircraft industry, the Office of Production and Research Development stated

## CRISIS IN ADDISON'S DISEASE PRECIPITATED BY ACUTE APPENDICITIS PINLIP LEAVITT, M D , Brooklyn, New York

In ADDISON'S disease, vomiting in diarrhea from whatever cause is likely to hring on a typical crisis through loss of chinnds and water <sup>1</sup>. The patient in the case to be presented vimited only in few times at the onset of her attack in acute appendicitia. Her crisis with frequent vimiting did not develop until her temperature reached a level of 102 F

Laipply<sup>3</sup> roports a death, four days after appendectors due to sudden cardae failure. This occurred despute the mplantation of a 150-mg, pellot in desexycorticosterono acetate two and a half months previously. The patient died suddenly, in contrast to the usual death caused by Addison's

disease, which is preceded by coma.

It has been pointed out that with an increased blood potassnum, which occurs often in Addison's disease the normal amplitude of the QR-S complex as compared to the T wave may be changed from a 3 1 ratio to a 1.5 1 ratio. The electrocardiogram of this patient showed a voltage of QR-S which was low—15 1

The dangers to be feared from overtreatment with desoxycorticosterone ocetate plus salt are edema, hyportension or cardiac enlargement. Even cardiac necrosis has been found of necropsy, due to excessive loss of petassium. The code-pressor test of Hines and Brown may anticipate the appearance of hypertension in those cases which are hyper reactive.

Rowntree and Snell, \* In a series of 33 cuses, showed that after a test meal 53 per cent of patients with Addison's disease did not have free hydrochloric and in their gastric juice. In 42 per cent of the cases there was a diminution of free hydrochloric acid (less than 20 units) Only 5 per cent were nor mal.

#### Case Report

S. R. 23 years old, married, nulliparous, was admutted to the Beth-El Hospital Brooklyn, on March 22 1945 with a nne-day history of abdom inal cramps, venniting and n rectal temperature of 101.5 F. There was muscle speam and robound tenderness in the right lower quadrant. Rectal examination was negative. Blood examination done before hospital admission showed a white blood count of 23 000, polymorphonuclears 63, staff celts, 11, lymphocytes 18, and monocytes, 8. A diagnosis of acute appendicitis probably retroevend was made because of the lack of tenderness on rectal examination. In the hospital another blood count confirmed the findings of the earlier examination

The diseased uppendix was removed that after moon, under spinal anesthesia. It was found to be retroceeal, very thick and abort. Because of the necessary dissection required in removing the appendix 36m sulfadiazine was spinisled at theopera tive ait and between the layers of the abdominal wall. The surgeon indeed 20,000 units of penicilling in the surgeon indeed to the surgeon intramuscularly and I dm in sulfadiazine mally, nvery four hours. The temperature remained between 102 F and 103

F, until March 25, 1945, when it gradually subsided to normal. Saline and glucose were given intravenously and hy clyms. All medication was then stopped, after a total of 425,000 units of penicillin and 18 Gm. of sulfadizine had been given.

Two urine examinations in the hospital were negative, and did not show sulfadiatino crystals. On March 26, 1945 a blood count revealed a red blood count of \_200,000 hemoglobin, 81 per cent white blood count if 0,900, polymorphonuclears, 64, moneytes, 2, staff cells, 6, segmented forms, 68, and lymphocytes, 33 The blood presure before operation was 98/68, at the end of the nporation it dropped to 80/60 The operation lasted fifty-five minutes.

Throughout her stay in the hospital she felt very weak, vomited several times daily, and had o very peculiar dusky color to her face, which was present only slightly before her illness. Her family had noted a gradual darkening of her skin for about a year. But the duskiness was deeper and different. There was no abdominal pain or distention. Her vomiting was apparently not due to the operative

procedure,

After two days at home with continued vomiting and persistent asthenia, she was re-examined. The history now revealed that she had been feeling weak and fired for about five years having received iron therapy which did not improve the arthenia. The patient never had tuberculosis but a maternal aunt had pulmonary tuberculosis. On examination, her blood pressure now was 70/50. The face presented a smoky hue, with many hlack freekles over the face thorax, and extremities. The tongue showed about twenty good-sazed pigmented spots diffusely distributed. There were areas of brownish pigmented spots along the gums, inside the llps, and on the buced mueous membrane opposite the molar teeth. There was a large black spot at the inner canthus of the loft eye. There was increased pigmentation around the corvax, ans, and perineum. The abdominal skin was pigmented, definitely outsided in a spice of the office of the programment of the adherive straps used after operation. The neerative scar was deeply pigmented.

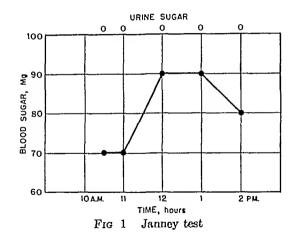

Her psyche was normal. When she finally had her next memes after the operation, it was delayed three weeks and much reduced in flow. Constipation was present. A tentitive diagnosis of Addison a disease was made, and because of her poor general condition, treatment was begun immediately with 3 cm of sodium choride given orally daily. A few days later after stopping salt therapy for a day, blood studies were started. The serum sodium was 129 milliequivalents per litt. and chlorides 420 mg, per 100 cc. A watter excretion test of Robinson, Power, and hopler was positive, i.e., the night urine specimen was greater than any forenoon specimen. Intranuecular injections of 5 mg, if desoxycerti-

Intransecular injections of 5 mg, of desoxycorticosterone sectate in oil were begun on April 19 1945 Improvement was immediate, the vomiting stopped, her appetite returned, and she began to feel stronger Before the illness her weight had been 133 pounds. It had later dropped to 111 pounds. With treatment it now climbod back to 125 pounds. The blood pressure became 110/70 The bowels now moved naturally, and the smoky hue of the face lessened, though the freekles remained.

At the end of the third week another water exerc-

1937

60

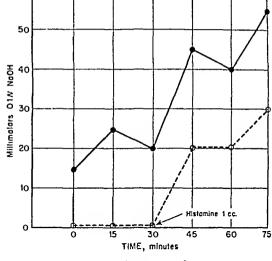

Fig 2 Gastric analysis

——, total acidity, --O--, free HCl

tion test was done. It showed a negative result, i.e., one of the forenoon urine specimens was greater in quantity than the night urine specimen. On May 14, 1945 edema of the face and ankles was noted, with the blood pressure still 110/70. The salt and desoxycorticosterone acetate were discontinued, and within two days the edema disappeared. The patient had apparently received overtreatment.

She was now admitted to the Mt Sinai Hospital, on Dr Baehr's service, for determination of her requirements of substitution therapy, with the ultimate view of implanting pellets of desoxycorticosterone acetate under the skin. On May 21, 1945 repeated blood chemistry studies showed 1445 milliequivalents of serum sodium per liter, chlorides 644 mg per 100 cc. The Wassermann test was negative. X-ray examination did not show any calcific deposits in the region of the adrenals, the thyroid was not enlarged, and the root of the pulmonary artery was prominent. The electrocardiogram showed a low voltage without myocardial damage. The ratio of the QR-S complex to the T wave was 151. The salt-deprivation test was not done because fatalities have been reported following its use 7. The Janney test showed a low sugartolerance curve (Fig. 1). The gastric analysis, taken during a bout of cramps and diarrhea, showed no free hydrochloric acid until histamine was injected, then the response was normal (Fig. 2).

Comment

This patient developed her Addisonian crisis at the height of her attack of appendicitis. Sulfadiazine was used at the operation and later without untoward effects. The infection in her appendix apparently precipitated the crisis, so that her complaints of several years' duration suddenly became understood as being due to Addison's disease

Since abdominal eramps and vomiting are frequent manifestations during Addison's disease, one must be careful in evaluating these symptoms before making a diagnosis of appendicitis and subjecting a patient to an unnecessary operation. It was unfortunate that the diagnosis was missed at the onset of her attack of appendicitis. In Addison's disease, an infection which is considered of

little importance may be followed by collapse and death within twenty-four hours 6

This young woman had a normal menstrual history until her attack of appendicuts, when the flow became delayed and scanty. This may have had nothing to do with the disturbance of the adrenal cortex, but simply to the occasional irregularity which may follow any operation. The next several menstruations were normal. It has been reported that some of these patients may lose pubic, axillary, and cutaneous hair, but such was not the case here

The increasing size of the heart may be the first warning of excessive use of sodium and desoxy-corticosterone acetate. In this case an x-ray showed the heart to be normal in size thirty-two days after institution of therapy.

According to Schneider, the water excretion test has a definite value in the diagnosis or exclusion of adrenal insufficiency, in the absence of renal disease, cachexia, and duodenal ulcer with pyloric obstruction. It has been considered of little value in determining response to treatment <sup>10</sup>. In some cases it has remained positive after intensive treatment. My patient did show a normal response to the water excretion test after three weeks of treatment.

Frequently there will be little or no free hydrochloric acid in the gastric juice, as was evidenced by this woman. During a crisis there is usually a further diminution. After the injection of histamine there was a normal excretion of free hydrochloric acid. This disturbance is probably hisked to the loss of electrolytes, or to some other factor which prevents the gastric glands from utilizing the chlorides. In favor of this view is the fact that after injection of histamine free hydrochloric acid did appear in the gastric juice.

I wish to thank Dr George Bachr for his permission to

present this case and also to thank Dr Samuel Lavine for his helpful suggestions

## POSTPARTUM INTESTINAL OBSTRUCTION DUE TO ADHESION BANDS

## A L HENKIN, M.D., Brooklyn, New York

WHILL intestinal obstruction immediately following labor is an extremely rare condition, during pregnancy this is not so unusual. Acute intestinal obstruction due to bands complicating pregnancy has been reported by F B Block and P M. Sales 1 A case of intestinal obstruction at seven months pregnancy due to extensivo peritoneal adhesions of obscure origin, was reported by P L. Hipsley \* Eighteen cases of volvulus com plicating pregnancy making a total number of 79 were reported in the literature by S G Kohn Henry A Briele, and L. H. Douglas 1

However, not a angle case of intestinal obstruction during the postpartum period was reported in the Quarterly Cumulative Index Medicus from

July, 1942 to June, 1944

Because of the ranty of this complication I thought it advisable to have on record the following CARA

#### Case Report

Mrs. F G aged 22, Para II gravida I, was admitted to Beth Moses Hospital on May 7, 1945 in Her previous history is irrelevant, except that she was always suffering from constipation which is suggestive in view of the findings at opera

When she was six months pregnant with her first child, three years ago, she had an attack of right-sided lower abdominal pain for which she was con-fined to bed. At that time a probable diagnosis of acuto appendicitis was made. She was treated with icebags on the abdomen and rest in bed after which she improved. She had an uneventful delivery at term and an uneventful postpartum course.

Following the birth of the first child she had several seizures of right-sided abdominal pain and was advised to have her appendix removed

The reported pregnancy was uneventful except for the attacks of pain in the lower right side of her abdomen, which would force her to stay in bed for one or two days Her date of confinement was due May 8.

On May 7 at 9:00 P u , the membranes ruptured spontaneously and pain started at 9 15 P u. A normal male child was born spontaneously at 11.30 Put There were no lacerations and a very slight amount of hleeding during the third stage of labor The patient was returned to bed in good condition.

About four hours later the patient began to com-

plain of abdominal pain in the right side. This pain increased in intensity and severity during the next forty-eight hours.

Her blood count showed hemoglobin, 12 5 Gm red blood count, 4,090,000, white blood count, 17,000, polymorphonuclears, 79 lymphocytes, 16, and monocytes, 5 Her blood pressure was 130/80, and her temperature was 99.8 F

On examination the patient appeared to be suffering extreme pain. The fundus uters was one such below the umhilicus. There was tenderness in the lower shdomen, more marked on the right side. There was also considerable rebound tenderness on the right side Pressure on the uterus towards the right and then sudden release caused aggravation of the pain.

In view of her history of previous attacks a diagnosis of acute exacerbation of chronic appendicitis was made and the patient was taken to the operating

Under spinal anesthesia of 150 mg of procaine a low right rectus incision was made, the peritoneal cavity was opened. There was a free cloudy fluid in the abdomen which was aspirated and later found to be sterile. The uterus and adnexa were normal A markedly distended and congested occum pre-sented itself. It was found to be rotated on its long axis and pulled up and to the right hy a thick. edematous fically band which was adherent to the right lateral wall of the abdomen The appendix was found retroeceal, apparently normal about 4 cm. long running up in the direction of the right kidney Tho meso-appendix was thick and short so that ligation was extremely difficult. The band was cut thus releasing the cecum. The appendix was removed in the usual manner and the stump invorted. The abdomen was closed in layers with out drainage and the patient was returned to bed in good condition. The postoperative course was un eventful and the patient was discharged from the hospital nino days later

Pathologic Report -Leukocytic infiltration of the

appendix.

Diagnosis — Chronic appendicitis.

In case of pain in the lower abdomen following delivery it would be most natural to think of an four or more hours later. The appendix is accused, quite rightly in many cases, as it was in this par-ticular case. This case however calls attention to the possibility of intestinal obstruction as a probable cause to be considered although an extremely rare

The findings in this case on the operating table would suggest a congenital malformation, namely, Pregnancy caused the an undescended cecum bands to be put on the stretch, thus explaining the pain during pregnancy Sudden release after birth of the child caused torsion of the cecum by the bands with resultant partial obstruction

## EPIDEMIC KERATOCONJUNCTIVITIS CURED THROUGH THE COMBINATION OF PENICILLIN AND SULFASUXIDINE

Max Jacobson, M.D., and Norbert W. Levin, M.D., New York City

THE following observations are being published for two reasons (1) because up to date no satisfactory therapeutic results can be obtained in epidemic keratoconjunctivitis, and (2) for the importance of the synergistic effect of sulfasuxidine and penicillin in a case of a virus infection in which the therapeutic effect can be clinically evaluated

It is not the intention of the authors to go into detail about the rationale of the therapy The sulfasuxidine was deliberately chosen for its possible neutralizing effect on any virus present in the intestinal tract The penicillin was chosen for its intracellular penetration The fact that penicillin, local or general, so far had mot with no success with this type of infection did not discourage the attempt to make use of the known synergistic effect of penicilin and sulfa drugs This publication is intended to encourage other research workers to check the above-mentioned findings in a disease, which at times has seriously hampered the war effort

Although we did not deal with a fresh case it is obvious from the case history mentioned below that it had all the earmarks of a very active virus infection.

#### Case Report

The patient, 44 years of age, contracted a severe case of epidemic keratoconjunctivitis upon his departure from the Far East a month prior to his arrival in the United States This diagnosis was confirmed during a short stay in Cairo (Egypt) He was seen by a major New York clinic where the same diagnosis was made Sulfa drops did not improve his condition. There was an increase of complaints of symptoms during reading, and finally,

a complete mability to work.

Findings of Each Eye—Epiphora, blcpharospasm, and slight swelling of the lids were present, but no discharge He had hyperemia of the con-junctival blood vessels The conjunctivae palpebrae, especially the conjunctivae of the lower lids, were highly hyperemic Numerous medium-sized oval follicles were visible in the conjunctivae of the lower lids, and a few follicles were also present in the retrotarsal fold of the conjunctive of the upper lids All over both corneas there were numerous opacities, about 1/2 mm in diameter, of grayish-whitish

color, circular and sharply defined, located just beneath the epithelium. Here and there the epithelium over the surface was slightly raised but it did not stain with fluorescein. Dots of this type are most numerous in the pupillary area. The foregoing findings confirmed the diagnosis of epidemic keratoconjunctivitis

The patient was under constant observation dur-ing the period of the treatment. The first two days there was hardly any change in the condition of the eyes but the patient claimed that he felt relieved, already being able to open the eyes more freely and not being disturbed so much any more by light On the third day the hyperemia of the conjunctivae was markedly less, the burning, tearing, photo-phobia, and the swelling of the lids started to subside

On the fourth day the patient felt subjectively I right The before-mentioned symptoms were almost gone, the conjunctivae of the bulbi did not show any signs of hyperemia, the conjunctivae of the lids were still somewhat hyperemic, and the follicles were markedly less. The patient was dismissed on the sixth day Burning, tearing, photophobia, and the swelling of the lids were gone, the conjunctivae had a normal appearance, but the corneal opacities remained unchanged. His vision

corneal opacities remained unchanged His vision was right eye 20/20, left eye 20/40

Therapy—The patient received during sixty hours 30,000 units every three hours During the second half of the treatment a solution of penicillin in human plasma was omployed. For the first two days three times three sulfasuxidine tablets and for the rest of his treatment four times three tablets were given

## Summary

A three-month-old case of opidemic keratoconjunctivitis with marked hyperemia of the con-Junctivae palpebrae and bulbi tearing, photophobia, and opacities of the cornea is discussed. The patient showed remarkably fast response to combined sulfasuxidine and penicillin.

At the time of the publication of this article the patient had been seen by the aforementioned hospital and considered as cured. In spite of a slight cold there was no relapse of the local condition The patient can be considered as thoroughly cured

### TEACHING GUIDE FOR HGME NURSE CLASSES

Teaching Guides to assist instructors of high school and college courses in Red Cross Home Nurslng have been prepared by the American Red Cross to be ready this Fall Previding specific sug gestions for class discussions, demonstrations, and practice, the material is so arranged that the course may be adapted with or without credit to existing curricula. The course may be taught entirely by a nurse-instructor or in cooperation with instructors of other courses in the same general field.

The high-school guide will present simpler nursing procedures with specific methods of teaching them to adolescent students. The college guide will include these but will be more extensive in scope and through the inclusion of basic principles under-Is lng procedures will be of higher academic level

The wartime shortage of physicians and profes-sional nurses has emphasized the urgency of more extensive home-nursing instruction. As a result, many educators have become convinced that home nursing should be made an integral part of the educa tion of all potential homemakers.

Many professional nunses are needed for part- or full time teaching, and through this teaching each instructor makes a valuable far-reaching contribution to improved nursing care of the sick.

## Medical News

## Medical and Dental Schools to Seek 12,000 Veterans

THE government opened a campaign in August to enroll twelve thousand war veterans immediately in medical and dental schools in a drive to replenish the nation's war-depleted supply of doctors and den-Its immediate goal is to enroll eight thousand veterans in medical and premedical schools and four thousand in dental and predental schools for courses starting this fall

Manpower Chief Paul V McNutt, in announcing the program, said the nation urgently needs thirty-

five thousand more doctors

"Unless we move quickly and successfully to wipe out the gaps torn in the ranks of the medical and dental professions," he said, "America will be denied essential security in terms of national health"

He said the situation is so severe that some medical schools will not fill any substantial part of

their first-year classes beginning next month

Therefore, he said, the government will try to sell discharged servicemen on the idea of entering the medical or dental profession Servicemen in various parts of the world will be supplied with information of such opportunities and an explanation of financial aid available under the GI Bill of Rights

The medical and dental professions will supply lecturers for separation centers, where the most likely candidates from among men scheduled for discharge will be screened on the basis of their qualifications and expressed interest.

Mr McNutt said that nearly 40 per cent of the nation's active practicing physicians are now in the armed forces, which also have taken about one-third

of the civilian dentists

Many more physicians will be needed for peacetime than were available before the war because the postwar needs of the armed forces alone will be for fifteen thousand doctors The Veterans Administration will need another fifteen thousand, and an undetermined number of doctors will be needed in liberated areas Mr. McNutt said a similar situation prevails in dentistry

Emphasizing the urgency of the situation, he "The success of the new program is essential added to the health and welfare of the people both at present and in the years to come, for without addi-tional medical and dental personnel there can be no assurance of the maintenance of American standards

of health."

## Volunteer Groups to Continue Work

THE end of World War II does not signal the end of volunteer activities in New York City, a survey of local agencies revealed in August At the same time Hospital Commissioner Edward M Bernecker declared that municipal hospitals will need assistance of nurses' aides for another six months to a year

"Our nursing shortage is critical," he said Japanese surrender does not mean a sudden return of trained nurses" About eight hundred aides have been giving about sixteen thousand hours a month, he said The hospitals need about six thousand, two hundred professional nurses, they have less than three thousand "If it were not for the loyal and devoted services of nurses' aides it would have been impossible for us to carry on," Dr Bernecker declared

A spokesman for the New York chapter, American Red Cross, said that training courses for nurses' aides and dietitians' aides would continue as a peacetime project and that the production service would continue to make dressings for local hospitals as well as for the Army and Navy The Red Cross also will continue its rehabilitation work with wounded voterans, its camps and hospital service, and its aid to families of servicemen

An elaborate postwar program has been developed and announced by the American Women's Voluntary Services Their peacetime activities will include rehabilitation work, a youth program, job retraining for women, public health and hospital work, conservation and salvage, practical thrift, motor transport, canteens and school lunch programs, and sewing projects for civilian welfare agencies. The A.W V.S. will continue to enroll new members for this work.

The Navy League will continue its activities-"after all, the Navy still goes on," an official said It will work with the convalescent, the wounded and the blind, and conduct services for Navy men's fami-

## New York City Will Help Children When Mothers Are Ill

NE of the major worries of parenthood—the care of children when their mothers are hospitalized-will soon be lessened and perhaps erased with the aid of the New York City Department of Welfare, Leonard V Harrison, newly appointed commissioner, has announced

Mr Harrison, a director of the Community Service Society, said that forty-five women will be hired soon as "mother's aids," and that children whose mothers are hospitalized or seriously ill at home will no longer be sent to institutions, but will be cared for at home by an aid

The program, effective within a few weeks, will serve two purposes, Mr Harrison said It will avoid the "psychological shock to the child of institutionalism" and it will help the Mayor's campaign to ease the present shortage of institutional

and foster-home facilities

In fact, Mr Harrison said, the aid will be a "sort of foster-mother in reverse" Instead of the children being sent to her home, she will go to the children's home and care for them until the father returns from The program is not meant for fatherless work children, he added In such cases the child must be sent to a home when the mother is away because "an aid can't work day and night both"

Mr Harrison said that the aids will work a total of two hundred and eight hours a month, equivalent to six eight-hour days weekly The city budget for 1945-1946 provided for forty-five such aids at a salary of \$1,440 a year and for an administrative staff

of a supervisor and four investigators

All aids will receive a three-week training course the department's household-training proat ject.

The program will include child care, intrition, marketing, meal planning, house care, laundering, clothing care and home care of the mck.

#### Alcoholics Study Is Conducted Here

SURVEY on the care and treatment of alco-A holles in the New York area is being conducted by the New York Academy of Medicine's committee on public health relations, it was announced on August 21 to the current issue of New York Medicine, publication of the Medical Society of the County of New York. Dr Hubert S Howe is chairman and Dr E. H L. Corwio is secretary of the subcommittee in charge.

The magazine said the survey was io lice with energetic movements in New Jersey, Maine, Washingtoo, DO Boston, and elsewhere. Commenting

on this wide interest and activity, the magazine says "So great has been the recent indication of cooperation between existing groups, varying all the way from alcoholic beverage commissioners to churches, clubs, civic authorities, hospitals, doctors—even the W C T U (who have indicated that they will not oppose use of liquor tax revenue for the rehabilitation of the alcoholic)—that the movement to improve treatment and facilities is taking on the semblance of a national campaign."

Questionnaires have been sent to every physician

in New York City and to every hospital, sanitarium, and other type of health facility treating inputients. A letter sent with the questionnaires explained that 'the apparent dearth of facilities for the care and treatment of alcoholism in the New York area has prompted a study of the existing situation "

More than one thousand seven hundred physicians have answered. Their questionnaire asked whether they treat alcoholics and whether they do so at special hours, what institutional facilities and treatment they use, what auxiliary organizations they use, and what in their judgment is the best way to deal with the problem of the alcoholic. The hospitals were asked whother they treat alcoholics for com plication of diseases, sobering up or for the addiction how many patients are treated, what proportion of acute cases ask for treatment for addiction, what treatment is used and whether follow up services are provided.

Replies from some hospitals have indicated that they sometimes find that patients admitted for other diseases are later found to be the result of chronic alcoholism.

#### Red Cross Will Survey French Children's Health

THREE-MEMBER Red Cross delegation left A in August for France to survey child health problems at the invitation of the French government, Basil O'Connor, chairman, has announced The delegation is headed by Dr Louis I Duhlin,

vice-president of the Metropolitan Life Insurance Company, and an assistant to Mr O'Connor Other members are Dr Leona V Baumgartner, pediatrician on leave from the New York City Health Department, and Mrs. Ida K Fivian, instructor of foreign languages at the Bradford Junior College, Bradford. Massachusetts

The survey, expected to be completed in two months, is being cooducted in collaboration with French health agencies and American Red Cross workers now in France. It is intended to find ways in which French health agencies can be assisted from abroad in meeting the needs of children

### Cadet Nurse Corps Is Still Recruiting

THE surrender of Japan has not yet ended the admission of new students to the United States Cadet Nurse Corps, and recruiting is continuing as usual. An estimated three thousand studeots in the New York area were planning to enter September classes for nurse training, and approximately 80 per cent of these have expressed the deare to join the copps, according to Miss Derothy V Wheeler, executive secretary of the New York Nursing Council for War Service.

Since the Japanese surrender was announced, the council s officers have been busy explaining to many of this group the terms of the Bolton act, which created the corps and provided scholarships for tui

tion, maintenance, uniforms, and a monthly stipend Under the act, she pointed out, students in school ninety days before the official end of the war may complete their training with government funds However, she believes that with the motive of patri otic service in wartime removed nearly 50 per cent of the three thousand beginners may drop out.

Because of the cootinued need of the trained professionals in the Army and Navy Nurse Corps and the estimated growing need for nurses by both the military and civilians in the postwar period, she em phasized that recruiting will continue and that every encouragement will be given to students who wish to enter the field

#### DDT Is Tested on Paralysis Fly

SPRAYING of DDT in sections of Rockford Illinois, in an attempt to halt the spread of in fantile paralysis, was an emergeocy measure which augmented a carefully planned program of experiments alroady carried out in three Eastern communities.

The experiments were made to determine the of fectiveness of D.D T io reducing populations of flies known to carry the virus of infantile paralysis.

Spraylog of D.D T from a B-29 bomber was completed at Rockford, where 148 cases of infantile paralysis have been reported since July 1 Savannah, New Haven Connecticut and Pater

son New Jersey were the cities selected for the other tests undertaken by the Fly Abatement Unit of the Arm Neurotropic Virus Commission working in cooperation with various other ageocies. disclosed by Dr Joseph L. Melnick one of the unit a

four physicians, at the office of the Paterson Board of

Health, where the unit has a field office

Dr Melnick said other cities had been selected for additional experiments but that it had not been determined when the unit might move on to another

It appeared doubtful that tests would be conducted in any of the five boroughs of New York City

Dr E R Coffey, medical and district director of the United States Public Health Service, one of the cooperating agencies, said he had had no indication that the unit would come here Dr Ernest L Stebbins, New York City Health Commissioner, said he doubted the experiments would be suggested for New York, because its areas are unsuitable for the

## Many Doctors Volunteer for Army Duty

MORE than twelve thousand physicians, four thousand dentists, eight thousand, nine hundred nurses, and several thousand other medical scientists from New York, Delaware, and New Jersey have volunteered their skills and services to the Army Medical Department since Pearl Harbor, Maj Gen Thomas A. Terry, commanding general of Second Service Command, announced in a statement commemorating the one hundred seventieth anniversary of Army medicine in July

General Terry revealed that Second Service Command medical facilities have accommodated more than six hundred thousand sick and wounded military personnel from all parts of the world since Japan precipitated war upon the nation, and he highly commended the Medical Department of his command area

Brig Gen Charles M Walson, recently promoted surgeon of Headquarters, Second Service Command, took the anniversary occasion to pay tribute to the medical profession of this area for its splendid response to the Army's call for physicians, nurses, dentists, physical therapists, and others of special medical training

## County News

Albany County

1996

Maj John C McChntock, Albany medical and surgical specialist, returned on August 10 after thirtytwo months overseas and has been honorably discharged from service

Dr McClintock was commissioned in July, 1942 and has served his entire field tour with a forward field hospital, the 3d Auxiliary Surgical Group, as a surgical team leader in North Africa and Europe

He wears the Bronze Star for meritorious service, the Bronze Service Arrowhead for assault landing, the wreath for his unit's Mentonious Service Plaque, and his service ribbons contain stars for action in Tumsia, Sicily, Normandy beachhead, the Rhineland, Ardennes and Central Europe

Three Albany physicians who have been serving overseas with the 33rd General Hospital were home on thirty-day leaves recently, after a flight across the Atlantic. They are Lt Col Henry Hun, Maj Arthur H Stein, and Maj Walter C Mott They have been detached from the hospital unit, which was formed in Albany, and are awaiting possible reassignment The unit, active since July, 1942, has been based near Leghorn, Italy, and previously was in Africa and Rome \*

Dr Edgar A Vander Veer, of Albany, was appointed on August 10 as a member of the medical board of the Employees' Retirement System.

His appointment, to succeed the late Dr Thomas M Holmes, of Delmar, was announced by State Comptroller Frank C Moore Dr Vander Veer is a graduate of the Albany.

Medical College

Dr Vander Veer, one of the founders of the American College of Surgeons and a former member of the board of governors, is now professor emeritus of surgery of the Albany Medical College and a member of the founders' group of the American Board of He is attending surgeon at St. Peter's

\* Asterisk indicates that item is from a local newspaper

Hospital, consulting surgeon at Memorial Hospital,

**Broome County** 

Set up with the cooperation of the county society and the Broome County Dental Society, fifteen doctors, two dentists, two representatives of the nursing profession, and four hospital administrators have formed a county Veterans Health Advisor, Council for returning servicemen

and is on the courtesy staff at Albany Hospital

Dr Anthony La Russo and Dr Hugh S Gregory, director of the Binghamton State' Hospital, as co-

chairmen head the health group

In announcing the new setup, Dr Gregory and that committee members have "volunteered their services in an advisory capacity to the Broome County Veterans Advisory Council."

He added that the group would "counsel with returning veterans of World War II—both men and women-concerning their health problems and advise them concerning the available agencies under this category which stand ready to aid them '

Announcement of the new committee was made in a letter to Vincent J Welsh, public relations chair-

man of the advisory council

Dr Frank G Moore, of Endicott, president of the county society, was in charge of committee volun-

teers for the advisory group

Physicians to work with Drs La Russo and Gregory are Dr Martin Weiss, Dr Herman M Hurdum, State Hospital, Dr Ralph C Goudey, Dr James Colella, Johnson City, Dr Walter Farrell, Johnson City, Dr Charles F Hawley, Dr A J Stillson, Windsor, Dr Vesta Rogers, Lisle, Dr Howard Raymond, Whitney Point, Dr Morns Eber, Maine, Dr George Depter Endicate Dr Farl W Maine, Dr George Danton, Endicott, Dr Earl W Mungle, and Dr Paul F Reich.\*

## Chenango County

Dr J Mott Crumb, of South Otsehe, was the noonday luncheon speaker on July 24, when he was a guest of Rotary at their regular weekly session held at The Chenango

Dr Crumb spoke on the topic, "The Great

American Tragedy," which had its setting in the northwestern section of Chenango County

#### Eric County

A glowing tribute to the work of the 23rd General Hospital, the Buffulo-formed unit, has been paid by Maj Gen Paul R. Hawley, chief surgeon of the European Theater of Operations The hospital, which left Buffalo three years ago, now is commanded by Col. C Baxter Brown Buffalo surgeon. He was originally named chief of the surgical section and was promoted to commanding officer several months ago

In a letter to Langdon Albright, president of the board of trustees of the Buffalo General Hospital,

Gen Hawley wrote
"Although it has been under my direction for only a matter of months, I wish, as one of my last and most pleasant duties as chiof surgeon of the European Theater of Operations, to make a record of the spleadid service of the 23rd General Hospital

"This hospital unit had already had almost a year of splendid service before joining the European Theater of Operations. After etaging in Africa from August 6, 1943 to October 25, 1943, the 23rd Gen-eral Hospital sailed for Italy and, after a staging period there, opened up on November 17, 1943, at Coroglio Italy, where it operated until September 23, 1944 The unit first started operations in France on

November 5, 1944, In the Grand Hotel at Vittel Vosgos at that time 140 miles from the front During this period the patient load was very heavy and this 1,000-bod hospital was handling, at one time, almost 3 000 patients.

"The Buffalo General Hospital can, indeed, to be proud of the 23rd General Hospital It has rendered outstanding service to our country, and it has been both an official and a personal pleasure for me to have had this fine unit under my direction."

Recently the hospital was moved from Vittel to Paris and, according to report from Redeployment

Headquarters is to be deactivated \*

Maj Hohbard Karbach Meyers, Buffalo physician, has been appointed consultant on anosthetics to the American Army for the entire European theater it was announced on July 20 by Dr Fraser
D Mooney, superintendent of Buffalo General
flospital Dr Mooney was first to be notified because Major Meyers is a member of the 23rd General Hospital Base Unit a group organized by General Hospital doctors and nurses of that institution and

other hospitals in this area.

Major Meyers was graduated from the University of Buffalo Medical School in 1936 and Interned at the Millard Filimore Hospital. He inter established a private practice in Canandaigua, where he also was a staff member of the Thompson Memorial Hospital and president of the Canandagua Medical Society

In 1941, Major Meyers returned to Buffalo where ho loined the blood bank service of General Hospital. Ho later joined the 23rd General Hospital Base Unit. remaining at the hospital on inactive status until July, 1942, when he was sent to Ft. Mead, Maryland Stationed in Paris since July 10 hie new post also

will take him to Versallics \*

#### Genessee County

Dr Marion Shepard, formerly of Batavia, and now of North Winter Park, Florida, was signally honored at a meeting of the Executive Board of the New York State Association of School Physicians held in Syracuse

At this time, it was voted unanimously to present Dr Shephard with a life membership in recognition of her distinguished services to the accociation. Dr Shepard served as secretary -treasurer for some years. at which time she was also doing outstanding work in the field of school health in Batavia.\*

Monroe County

Dr William A. MacVay chief of medical service with the 251st General Hospital in France has been

promoted to hentenant colonel.

Dr MacVay served on the faculty of the University of Rochester Medical School for ten years before going in service. He was also secretary to the Monroe County Medical Society and on the staff at General Hospital. He is a graduate of the Univer sity of Michigan.

The physician has been overseas for almost two years and is now at a redeployment center in France.\*

#### Richmond County

Dr Albert Accettola of Staten Island, a graduate of the Boston University School of Medicine, has necepted appointment as a research fellow in orthoedic surgery at Bellevue Hospital Manhattan He recently completed an internahip at the Staten Island Hospital. In 1943, Dr. Accettola received a medical dis-

charge from the Army \*

## Necrology

John Peter Boroszewski, M.D., of Buffalo, died on June 22 at the age of 44 Ho was graduated in 1920 from the University of Buffelo Behool of Medicine, was associate physician at the Millard Fillmore Hospital in Buffalo, and a member of the American Public Health Association, the New York Academy of Medicine, the American Medical Association, and the New York State and Eric County medical societies.

Joseph Anthony Di Leo, M D, of Long Island City died on August 9 at the age of 40 Dr Di Leo received his medical degree from Loyola University School of Medicine, in Chicago, in 1931, and was

junior assistant attending physician at St. John a Long Island City Hospital He was a member of the medical societies of Long Island City, Queens County, and New York State, and of the American Medical Association

Andrew Barron Fitzgerald, M.D., of North Creek died on July 30 at the ago of 57 Dr. Fitzgerald was graduated from the University of Vermont College

of Medicine in 1912

Albrecht Eugene Fuld, M D., of Port Washington died on July 3 at the age of 37 A graduate of the University of Berlin medical school in 1032, Dr Fuld was formerly assistant reentgenologist at the Oneida City Hospital in Oneida He was a member of the Medical Society of the State of New York,

and of the American Medical Association

William Linder, M D, of Brooklyn, and dean of surgery at the Jewish Hospital in Brooklyn, died on August 12. He was 72. Dr. Linder was also surgeon-in-chief of Israel Zion Hospital and former professor of clinical surgery at the Long Island College Hospital. He was graduated from Bellevue Medical College in 1896 and interned at Bellevue Hospital and St. Catherine's Hospital in Brooklyn He was a past president of the Kings County Medical Society, and held membership in the Brooklyn Pathological Society, Brooklyn Surgical Society, the American Medical Association, and the New York Academy of Medicine, and was a fellow of the American College of Surgeons. He was a senior surgeon of the U.S. Public Health Service by appointment of the late President Roosevelt.

Christopher F Mack, M D, of Richmond Hill, Queens, died at the age of 78 on July 23 He received his medical degree from the New York University College of Medicine in 1898, and had been a practicing physician in Richmond Hill for twenty-

five years

Percy Edwin Dunlop Malcolm, M D, of New York City, died on July 29 in Quebec, Canada He was 75 years old Dr Malcolm was graduated in 1893 from Bellevue Medical College, and specialized in otolaryngology He was a member of the state and county medical societies, the American Medical Association, a fellow of the New York Academy of Medicine, and a diplomate of the American Board of Otolaryngology He was also

a charter member of the New York Otolaryngological Society, and a member of the Board of Surgeons of the Manhattan Eye, Ear, and Throat Hospital

of the Manhattan Eye, Ear, and Throat Hospital
Emanuel M Radlow, MD, of Cold Spring, and
formerly of New York City, died on April 14 Dr
Radlow received his medical degree from the Uni-

versity of Koenigsberg in 1901

Martin L Sowers, M D, of Far Rockaway, was drowned, following a heart attack, while bathing at Long Beach on July 27 Dr Sowers was 52 He was graduated in 1913 from the Medical College of the University of Virginia, and took postgraduate work at Harvard University for the next two years as he was then too young to obtain a medical heense He served his internship at the Manhattan Eye, Nose and Ear Infirmary He was a member of the New York State Medical Society, New York County and Queens County medical societies, Nassau County Medical Society, and the American Medical Association He was a consultant otolaryngologist at St Joseph's Hospital, Rockaway Beach, and Long Beach hospitals, and was formerly on the staff of the New York Eye, Nose and Ear Infirmary

of the New York Eye, Nose and Ear Infirmary
George L Wright, MD, of Syracuse, a member
of the faculty of the Syracuse University College of
Medicine and Syracuse fire and police surgeon for
many years, died on July 22 He was 59 years eld
He was associate surgeon of St Joseph's Hospital,
and a member of the Onondaga County Medical
Society, the Medical Society of the State of New
York, and the American Medical Association Dr
Wright received his medical degree in 1911 from the
Syracuse University College of Medicine, and served
his internship at St Joseph's Hospital in Syracuse

## A FRIEND IN NEED

We are pretty blue today Every physician has his sorrowful experiences but we have just had a streak of them, situations in which we feel so helpless yet so honored. Three times in the last five days we have been called to a home where a representative of the Western Union had just left a tele-

gram from the War Department

We all have read the war correspondents' descriptions of the battlefields of our Army, Navy, and Arr Corps The dirt, the mud, the pain, the wounded, the dead, the refugees, the bravery, the hard work, the unselfishness, and the sacrifice of the war can be written in a variety of moods But nothing can compare to the picture of the mother who has just received the word that her son has just paid the supreme sacrifice for his country All the prayers that she has prayed and all the hopes she has held are suddenly for naught When her son entered the armed services she knew that this moment might Now it is here Hysterical and grief stricken from the sudden shock of the news, she sits in a daze, wondering if the telegram can be true Members of the family have gathered around her but in their own grief they can offer her small com-In despair, they turn to someone who might fort help lessen her burden

Who do they turn to? The family physician We know of no tougher assignment for the physi-There is no drug or surgery that will cure this His first impulse is to duck the call, but when he considers the trust this family puts in him, even to the point of sharing their sorrows with them, he cannot refuse the call The family knows there is nothing he can do to void the news but they feel that just his presence and the few words he may say may tide over those first few hours of grief might give a sedative, but that is not what counts It is the thought that "Doc" is a fellow they can trust, someone outside the family (not a sympathetic or maybe curious neighbor), someone whe is both a friend and confidant, who is a realist, who knows this is an act of the Supreme Being, but whe also knows the pain and sorrow that goes with such a happening and so knows just what to do and how to help What an honor to be called under such circumstances

May the practice of medicine be ever so—with complete faith between physician and patient, a service of mutual understanding, honor and trust, not dollars and cents and mandatory laws—W B Harm, M.D., in Detroit Medical News, March 19, 1945

## Hospital News

#### Four Million Given by Sloan Fund to Fight Cancer

MEMORIAL Hospital for the Treatment of Cancer and Allied Diseases, 444 Last Sixtyeighth Street, will become an international center for the study of the causes and treatment of cancer, under the terms of a \$4,000 000 grant by the Alfred

P Sloan Foundation, it was announced on August 7
Combining the skill and training of medical researchers with the highly geared methods of modern industrial research, the foundation and the hospital, already one of the country's outstanding cancer centers, plan to launch a ten year campaign against the disease which yearly takes the life of one out of every nine Americans.

At the end of this period it is hoped that not only

will the cause and cure of cancer, still shrouded from science, be theroughly understood but that a simple test will have been devised to determine cancer susceptibility and make it posmble to ward off the discare loog before it is contracted

"This is an incredible thought,' Alfred P Sloan Jr, said "but I don't thick it is outside a reasons blo

range of accomplishment.

The foundation, Mr Sloan said, will provide \$2,000,000 for the construction of a thirteen-slop. research building, to be known as the Slean hotter ing Institute for Cancer Research, and in addition will provide \$200 000 annually for ten years for

operating costs.

The institute will serve as a central coordinating point between two other Memorial Hospital bulld ings, and the three will cover the entire block bounded by Sixty-seventh and Sixty-eightic streets York and First Avenues. The existing heapltal building, erected in 1030, will be enlarged and re-arranged to provide space for three hundred beds, while the Dr James Ewing Hospital, which the City of New York has contracted to build and maintain, will provide space for three hundred more patients.

The entire project, which will be put into construction as soon as conditions allow, is expected to cost \$4,500,000 In addition, money will be needed for projected four year cancer followships and to To this end Memoprovide for specialized facilities rial Hospital will soon appeal to the public although Mr Coumbo said, the goal for the drive has not

been set

As 85 per cent of cancer research is unrelated to persons who have cencer—that is, as it is a matter of "pure" laboratory work—the institute will be self-contained although it will be a part of the center and entitled to study hospital patients as its researchers may find necessary

Withio Its walls will be contained all Instruments

of science which can be mobilized in the study of cancer-brochemical laboratories, pathologia labora

tories, laboratories for the study of ntomic physics "Alomic energy release," Dr. Rhonds said "which is the junciple on which the atomic bomb works, may also be used to cause or cure caucer. We shall, of course, continue our experiments in this field 'For several years Memorial Hospital has been

experimenting with the destruction of cancer cells by exploding them with particles of atoms. In the treatment of leukemia, a form of cancer, radioactive phosphorus, prepared by an atom simular, has been injected experimentally into diseased tissues. It is the feeling of the Sloan Loundation, Mr.

Bloan sald that experiments along these and other lines will be vestly speeded up if the experience of in dustrial researches is brought in bear on the problems. It will be the function of Dr Ivettering, he sald, to make this experience maliable to the reien

tists nt the lustitute

"We are convinced," he declared, "that the same broad principles of organized industrial research can be adapted so as to bear effectively on this on

tirely different problem "

Dr. Kettering outlining plans for the contaration of lindustry and medicine at the institute, said that "we have no desire to dietate a procedure-nil we can do is to bring to the doctors and lay on the table certain methods of research which we have found helpful."

"This type of effort," Dr. Illiands said, "Is the one ldeal way to obtain the desired end, the understand

ing of cancer"

Acknowledging the gift, Mr Coumbe progred that "this is the first time that a program of this extent has been financed to this extent, and over this peried of time "

"Flus ten year program," he sald, "will parmit us to surround ourselves with the very hest technical brains in the field and aroure them of a long range program they can work nn With ductors coming from Europe and other parts of the world, as they will, it will truly be an international center?

A separate board of Irristers will supervise the institute, Mr. Sloan said. There will be four reprecontatives of the foundation and five of the hospital

The Cancer Center will be a unit of one of the world's largest groups of institutions for incident care, toaching, and research. This group includes the New York Hospital, Cornell University Medi-cal College, with which Memorial is oblitated, and the Hockefeller Institute for Medical Item arch the organizations work in close cooperation

## Doctor Favors Local Hospital Usage for Vets

VETERANS' facilities program which through A treatment of war veterans by their own physicians lo local hospitals would eliminate enermous expenditures of bullding additional hospitals, has been proposed by Dr. Herbert F. Schwartz. Pine Crest Sanatorium Superfolcodent.

He has submitted a four-point program which he claims will result to a profit to each community and

also provide more comfort for veterans through being nearer their homes and families.

"To view of the furore recently created because of conditions in veterant' facilities" he said, "It appears rather permionic that the government is planning the expenditure of many millions to build ad ditional hospitals,

"The shortcomings are inherent on the system itself rather than in the administration thereof he continued, "and it behooves us to consider other po-abilities

seiQue of the popular apprections is that veterans

be treated in local hospitals by their own physicians The hospitals and physicians would be paid according to an established schedule of rates similar to that now being used in workmen's compensation advantages of such a plan are fourfold

The government would save hundreds of millions of dollars in construction and equipment of new facilities

The veteran would be near home and could

enjoy visits from family and friends

The income would provide the local institutions with funds for nocessary improvements
"4 The veteran would have complete freedom

of choice of physician and hospital (This is at present denied to him )

"In this manner the entire community would

profit
"The program would probably be less expensive even if we discount the original cost of construction and equipment for the per capita cost in many hospitals is lower than that in veterans' facilities

"In addition there would be little or no transportation costs between the patient's home and hospital The plan certainly deserves to be called to the attention of the various organizations concerned and they in turn should examine it in detail," says Dr Schwartz

## Improvements

The first wing of three therapeutic swimming pools at Halloran General Hospital, Willowbrook, was officially dedicated on July 15 by Postmaster General Robert E Hannegan and turned over to Brig Gen Ralph G DeVoc, commanding general

Saying that it is the first pool to be constructed at a veterans' installation, Hannegan stated, "This pool is an example to other communities on how to pay back some of the huge debt that we owe to our

nghting men"

A demonstration was given showing the progress and intensive physical therapy in the treatment of paralytic patients. The demonstration was by patients who have progressed from complete paralysis of lower extremities to a stage that permitted them to take active part in the dedication ceremonics

Slowly, they rose from their wheelchairs at the pool's edge, and carefully made their way into the water, where they were able to move their legs, and walk between two parallel bars, some with canes One patient had so far progressed as to be able to dive An exhibition of the apeutic treatments to be given at the hospital was presented by Army personnel

The pool is 60 by 100 feet, varying in depth from 3 feet at the shallow end to 9 feet, 6 inches corners of the deep end, concrete steps have been

constructed

There also are steps radiating 5 feet 6 inches from the inside face of the pool providing comfortable access in and out of the pool for disabled personnel. At the deep end two diving boards have been provided The pool has a capacity of 250,000 gallons of water

It is the first of a group of three pools, another outdoor one of smaller dimensions, and an indoor one for winter use, enclosed in a heated building with adjoining locker rooms and toilet facilities, including therapy treatments for both men and women patient personnel \*

Dedication of a spacious new kitchen, designed and equipped with the latest modern conveniences,

has taken place at New Syracuse General Hospital Huntington B Crouse, Jr, unveiled the light green plaque inscribed, 'The kitchen given by

Crouse-Hinds Co, in memory of Huntington Beard Crouse "

William L Hinds, president of the Crouse-Hinds Co, presented the kitchen to Ernest L Owen, treasurer of the hospital, who thanked him "in behalf of the trustees and officers for your kind thoughts and gracious gifts "

The new kitchen, in use since June 1, is situated in an area formerly occupied by the nurses' dining room A partition was removed to leave one large room, about 66 by 30 feet, and former classrooms were converted into the current dining room

Costing about \$12,000, it has been equipped with a stainless-steel table and cafeteria counter, three wooden work tables, a pastry table, a stainless steel sink, a new aluminum 50-gallon steam kettle, two stainless steel four-gallon coffee urns, a new refrigerator, two new gas-electric toasters, a deepfat frier, and a bain-Marie

Three meals a day and one at midnight are served cafeteria-style to from one hundred twenty-five to one hundred fifty nurses and employees The kitchen accommodates three dictitions and twentyseven employees, in addition to high-school boys,

and girls who work part-time

The latest device to come from the research of W R Kearsloy, of the General Electric Co, is an "electric" hospital bed which can be raised or lowered without the aid of a nurse

Push-button electric control, which eliminates the hand crank and allows a patient to adjust his own position without "so much as moving a toe," is in the experimental stage at Ellis Hospital, in

Schenectady, the company reported

The "electric bed" is powered by two motors, each of which is equivalent to one-fourth the power of a washing machine motor A movable control

box permits both the feet and head to be raised or lowered, or one to be raised while the other is low-

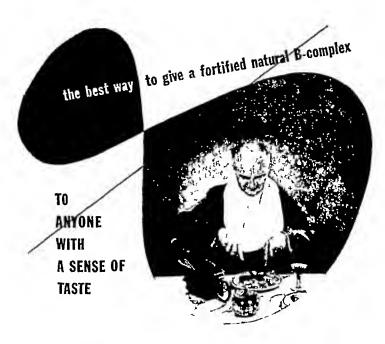

The device was first conceived by Mr Kearsley at the suggestion of Dr Louis Koller, also of the laboratory It is eventually expected to "prove a boon to patients as well as harried nurses," G.E. stated \*

## At the Helm

Bertrand H Snell, of Potsdam, was re-elected president of the board of directors of the A Barton Hepburn Hospital at its annual meeting at the hospital on July 17

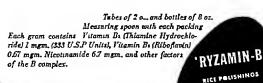

Other officers named at the meeting are J Edgar Boyer, of Ogdensburg, vice-president, James Hunt, Ogdensburg, secretary, and Edmund Fitzgerald, of Watertown, treasurer Three new directors named

at the meeting are Henry H McConville and Alfred Lavigne, both of Ogdensburg, and Frank VanElderstein, of Canton

Cohoes Hospital has a new superintendent Miss Elizabeth G Lautermilch, of Bayonne, New Jersey, has been appointed to the post by the hospital Board of Directors The appointment was effective as of July 15

Miss Lautermilch has already assumed her duties as superintendent She was named to succeed Miss Isabelle V Cameron who resigned the position on July 1 after having served as head of the institution

for a year

A graduate of Staten Island Hospital, New York City, Miss Lautermilch served as director of Warren Hospital at Warren, Pennsylvania, before coming to Cohoes She has done nursing work and acted as supervisor in a number of other hospitals, according to the board's announcement \*

Miss H Evelyn Ward was named director of nursing at Binghamton City Hospital on July 17 The appointment was effective August 15

Miss Ward was promoted from the position of assistant director, as Jerome F Peck, hospital superintendent, and the Board of Managers accepted the resignation of Miss Beatrice E Ritter

The board also accepted Mr Peck's resignation as

of July 31

The board created the nonpaying job of superintendont emeritus and appointed Mr. Peck to fill it

In appointing Mr Peck superintendent emeritus, board members expressed a desire to have his advice in connection with a proposed \$550,000 building construction program.

After the veteran superintendent's resignation becomes effective, operation of the hospital will be in charge of Marion Sawtelle, assistant superintend-

ent.

It was indicated that the board will not consider filling the superintendent's post on a permanent basis for at least a year, since members expressed hope that Mr Peck would be able to return to the

Miss Helen Succop, of Rochester, has assumed her new duties as director of nurses at the Geneva General Hospital She is replacing Mrs Hazel Bastian Wilson, who has been director of nurses at the hospital for the past three years

Miss Succop came to Geneva from Mcadville, Pennsylvania, where she was Nursi g Arts Director

and Director of Nurses \*

Four associate deans have been appointed to the staff of the Columbia University Medical Center, New York City, it is announced by Dean Willard Rappleye.

These appointments, in addition to that of Dr Bion R. East as associate dean of the School of Dental and Oral Surgery, previously announced, complete the administrative organization of the Medical Center

Aura E Severinghaus and Vernon They include W. Lippard as associate deans for medicine, Margaret E Conrad, associate dean for nursing, and Harry S Mustard, associate dean for public health \*

With twenty years of training and experience in obstetrics and in maternal and child health, Dr Adman L Carson, Jr, Richmond, Virginia, has accepted a temporary appointment as obstetrician-in-

chief of the Bassett Hospital, in Cooperstown
Dr Carson was graduated from the Medical College of Virginia in 1925 Following a short period as a physician in industrial medicine with the US Steel Corp, he took graduate training in obstetnes

in New York City

He was resident obstetrician at the old Nursery and Child's Hospital, which more recently has been absorbed by the New York Hospital as a component of the Department of Obstetrics of Cornell University Medical College For several years he was director of the county health department of Fairfax County, Virginia, and then became successively assistant director and director of the Bureau of Maternal and Child Health of the Virginia State Department of Health in Richmond

His graduate work also included studies at Harvard School of Public Health in maternal and childhealth administration During these years of pubhe-health work, with special attention to maternal and child health, Dr Carson was a teacher of obstetrics at the Medical College of Virginia, where he held the position of assistant professor. He has also acted as consultant in obstetrics in Richmond and the surrounding area. He is one of the seven members of the Maternal and Child Health Commission of Virginia Recently he was president of the Virgma Obstetrical and Gynecological Society a Fellow of the American Public Health Association \*

Ten newly commissioned Medical Corps officers have been added to the staff at Rhoads General Hospital for training, it was announced in July by Col A J Canning, commanding officer

The officers, all first heutenants, are

John T. McGeehan, Raphael De Horatius, Holstein D Cleaver, Jr, and Frank W Blair, all of Philadelphia, Paul D Houston, Plymouth, Maine, John Altmeyer, Walter J Blasco, George C Lewis, all of Pennsylvania, John P Chandler, East Bridgewater, Massachusetts, and Delbert Victor Newcomer, Kalamazoo, Michigan \*

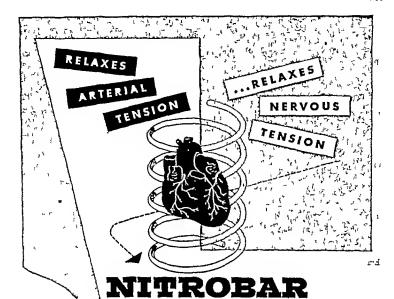

The annual meeting of the board of directors of the Champlain Valloy Hospital in Plattsburg was At that time the held at the nurses home, July 23 officers of the board were elected

The following is a list of the officers elected president, Emmett J Roach, vice-president, Robert C Booth, secretary, Simon E Fitzpatrick, treasurer, Fred Justin John C Agnew was elected a member of the board

of directors '

The first regular meeting of the re-organized Board of Directors of the Johnstown Hospital Corporation in Gloversville was held on July 10 at the David A. Wells homestead, in Johnstown, re-cently offered as a site for a hospital in this city

McNeil Laboratories

[Continued from page 2002]

City Attorney Alfred D Dennison, who was instrumental in securing this splendid gift, was elected president of the board He succeeds Richard M Evans, who has held office since the board was first

organized about twenty years ago
It was reported that already a half dozen offers have been received from persons desiring to furnish a room in the new hospital as a memorial for one of their family, or aid in the purchase of equipment,

The following other officers were named vicepresident, John E Wells, secretary, Attorney Anson Getman, assistant secretary, Attorney Walter J Hogan, treasurer, Milton C Sutton, and assistant treasurer, William H Van Voast \*

## Newsy Notes

Increasing numbers of elderly and middle-aged people utilizing the social service departments of hospitals, probably as a result of the war or a broader understanding of the problem by physi-cians, have given this branch a foremost place in the postwar expansion program of the Buffalo General Hospital

The hospital board engaged in raising \$4,000,000 to erect a new building and expand present facilities sees the need for a large social service department in reports showing an increase in the number of old

people
